Unmixing Diffusion for Self-Supervised Hyperspectral Image Denoising

Haijin Zeng, Jiezhang Cao, Kai Zhang, Yongyong Chen, Hiep Luong, Wilfried Philips; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 27820-27830

Hyperspectral images (HSIs) have extensive applications in various fields such as medicine agriculture and industry. Nevertheless acquiring high signal-to-noise ratio HSI poses a challenge due to narrow-band spectral filtering. Consequently the importance of HSI denoising is substantial especially for snapshot hyperspectral imaging technology. While most previous HSI denoising methods are supervised creating supervised training datasets for the diverse scenes hyperspectral cameras and scan parameters is impractical. In this work we present Diff-Unmix a self-supervised denoising method for HSI using diffusion denoising generative models. Specifically Diff-Unmix addresses the challenge of recovering noise-degraded HSI through a fusion of Spectral Unmixing and conditional abundance generation. Firstly it employs a learnable block-based spectral unmixing strategy complemented by a pure transformer-based backbone. Then we introduce a self-supervised generative diffusion network to enhance abundance maps from the spectral unmixing block. This network reconstructs noise-free Unmixing probability distributions effectively mitigating noise-induced degradations within these components. Finally the reconstructed HSI is reconstructed through unmixing reconstruction by blending the diffusion-adjusted abundance map with the spectral endmembers. Experimental results on both simulated and real-world noisy datasets show that Diff-Unmix achieves state-of-the-art performance.

Seeing the World through Your Eyes

Hadi Alzayer, Kevin Zhang, Brandon Feng, Christopher A. Metzler, Jia-Bin Huang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 4864-4873

The reflective nature of the human eye is an under-appreciated source of information about what the world around us looks like. By imaging the eyes of a moving person we capture multiple views of a scene outside the camera's direct line of sight through the reflections in the eyes. In this paper we reconstruct a radiance field beyond the camera's line of sight using portrait images containing eye reflections. This task is challenging due to 1) the difficulty of accurately estimating eye poses and 2) the entangled appearance of the iris textures and the scene reflections. To address these our method jointly optimizes the cornea poses the radiance field depicting the scene and the observer's eye iris texture. We further present a regularization prior on the iris texture to improve scene reconstruction quality. Through various experiments on synthetic and real-world captures featuring people with varied eye colors and lighting conditions we demonstrate the feasibility of our approach to recover the radiance field using cornea reflections.

DPMesh: Exploiting Diffusion Prior for Occluded Human Mesh Recovery

Yixuan Zhu, Ao Li, Yansong Tang, Wenliang Zhao, Jie Zhou, Jiwen Lu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 1101-1110

The recovery of occluded human meshes poses challenges for current methods due to the difficulty in extracting effective image features under severe occlusion. In this paper we introduce DPMesh an innovative framework for occluded human mesh recovery that capitalizes on the profound knowledge about object structure and spatial relationships embedded in a pre-trained text-to-image diffusion model. Unlike previous methods reliant on conventional backbones for vanilla feature extraction DPMesh seamlessly integrates the pre-trained denoising U-Net with potent priors as its image backbone and performs a single-step inference to provide occlusion-aware information. To enhance the perception capability for occluded poses DPMesh incorporates judicious guidance via condition injection which produces effective controls from 2D observations for the denoising U-Net. Furthermore we explore a dedicated noisy key-point reasoning approach to mitigate disturbances arising from occlusion and crowded scenarios. This strategy fully unleashes th

e perceptual capability of the diffusion prior thereby enhancing accuracy. Exten sive quantitative and qualitative experiments affirm the efficacy of our framewo rk as we outperform state-of-the-art methods on both occlusion-specific and stan dard datasets underscoring its ability to achieve precise and robust 3D human me sh recovery particularly in challenging scenarios involving occlusion and crowde d scenes. Code is available at https://github.com/EternalEvan/DPMesh.

Ungeneralizable Examples
Jingwen Ye, Xinchao Wang; Proceedings of the IEEE/CVF Conference on Computer Vis ion and Pattern Recognition (CVPR), 2024, pp. 11944-11953
The training of contemporary deep learning models heavily relies on publicly ava ilable data posing a risk of unauthorized access to online data and raising conc erns about data privacy. Current approaches to creating unlearnable data involve incorporating small specially designed noises but these methods strictly limit data usability overlooking its potential usage in authorized scenarios. In this paper we extend the concept of unlearnable data to conditional data learnability and introduce UnGeneralizable Examples (UGEs). UGEs exhibit learnability for au thorized users while maintaining unlearnability for potential hackers. The prote ctor defines the authorized network and optimizes UGEs to match the gradients of the original data and its ungeneralizable version ensuring learnability. To pre vent unauthorized learning UGEs are trained by maximizing a designated distance loss in a common feature space. Additionally to further safeguard the authorized side from potential attacks we introduce additional undistillation optimization . Experimental results on multiple datasets and various networks demonstrate tha t the proposed UGEs framework preserves data usability while reducing training p erformance on hacker networks even under different types of attacks.

LaneCPP: Continuous 3D Lane Detection using Physical Priors
Maximilian Pittner, Joel Janai, Alexandru P. Condurache; Proceedings of the IEEE /CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 106 39-10648
Monocular 3D lane detection has become a fundamental problem in the context of a utonomous driving which comprises the tasks of finding the road surface and loca ting lane markings. One major challenge lies in a flexible but robust line repre sentation capable of modeling complex lane structures while still avoiding unpre dictable behavior. While previous methods rely on fully data-driven approaches w e instead introduce a novel approach LaneCPP that uses a continuous 3D lane dete ction model leveraging physical prior knowledge about the lane structure and roa d geometry. While our sophisticated lane model is capable of modeling complex ro ad structures it also shows robust behavior since physical constraints are incor porated by means of a regularization scheme that can be analytically applied to our parametric representation. Moreover we incorporate prior knowledge about the road geometry into the 3D feature space by modeling geometry-aware spatial feat ures guiding the network to learn an internal road surface representation. In ou r experiments we show the benefits of our contributions and prove the meaningful ness of using priors to make 3D lane detection more robust. The results show tha t LaneCPP achieves state-of-the-art performance in terms of F-Score and geometri c errors.

CityDreamer: Compositional Generative Model of Unbounded 3D Cities
Haozhe Xie, Zhaoxi Chen, Fangzhou Hong, Ziwei Liu; Proceedings of the IEEE/CVF C onference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 9666-9675
3D city generation is a desirable yet challenging task since humans are more sen sitive to structural distortions in urban environments. Additionally generating 3D cities is more complex than 3D natural scenes since buildings as objects of t he same class exhibit a wider range of appearances compared to the relatively co nsistent appearance of objects like trees in natural scenes. To address these ch allenges we propose CityDreamer a compositional generative model designed specif ically for unbounded 3D cities. Our key insight is that 3D city generation shoul d be a composition of different types of neural fields: 1) various building inst

ances and 2) background stuff such as roads and green lands. Specifically we ado
pt the bird's eye view scene representation and employ a volumetric render for b
oth instance-oriented and stuff-oriented neural fields. The generative hash grid
 and periodic positional embedding are tailored as scene parameterization to sui
t the distinct characteristics of building instances and background stuff. Furth
ermore we contribute a suite of CityGen Datasets including OSM and GoogleEarth w
hich comprises a vast amount of real-world city imagery to enhance the realism o
f the generated 3D cities both in their layouts and appearances. CityDreamer ach
ieves state-of-the-art performance not only in generating realistic 3D cities bu
t also in localized editing within the generated cities.

HEAL-SWIN: A Vision Transformer On The Sphere
Oscar Carlsson, Jan E. Gerken, Hampus Linander, Heiner Spieß, Fredrik Ohlsson, C
hristoffer Petersson, Daniel Persson; Proceedings of the IEEE/CVF Conference on
Computer Vision and Pattern Recognition (CVPR), 2024, pp. 6067-6077
High-resolution wide-angle fisheye images are becoming more and more important f
or robotics applications such as autonomous driving. However using ordinary conv
olutional neural networks or vision transformers on this data is problematic due
 to projection and distortion losses introduced when projecting to a rectangular
 grid on the plane. We introduce the HEAL-SWIN transformer which combines the hi
ghly uniform Hierarchical Equal Area iso-Latitude Pixelation (HEALPix) grid used
 in astrophysics and cosmology with the Hierarchical Shifted-Window (SWIN) trans
former to yield an efficient and flexible model capable of training on high-reso
lution distortion-free spherical data. In HEAL-SWIN the nested structure of the
HEALPix grid is used to perform the patching and windowing operations of the SWI
N transformer enabling the network to process spherical representations with min
imal computational overhead. We demonstrate the superior performance of our mode
l on both synthetic and real automotive datasets as well as a selection of other
 image datasets for semantic segmentation depth regression and classification ta
sks. Our code is publicly available.

3D Paintbrush: Local Stylization of 3D Shapes with Cascaded Score Distillation
Dale Decatur, Itai Lang, Kfir Aberman, Rana Hanocka; Proceedings of the IEEE/CVF
 Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 4473-44
83
We present 3D Paintbrush a technique for automatically texturing local semantic
regions on meshes via text descriptions. Our method is designed to operate direc
tly on meshes producing texture maps which seamlessly integrate into standard gr
aphics pipelines. We opt to simultaneously produce a localization map (to specif
y the edit region) and a texture map which conforms to it. This approach improve
s the quality of both the localization and the stylization. To enhance the detai
ls and resolution of the textured area we leverage multiple stages of a cascaded
 diffusion model to supervise our local editing technique with generative priors
 learned from images at different resolutions. Our technique referred to as Casc
aded Score Distillation (CSD) simultaneously distills scores at multiple resolut
ions in a cascaded fashion enabling control over both the granularity and global
 understanding of the supervision. We demonstrate the effectiveness of 3D Paintb
rush to locally texture different semantic regions on a variety of shapes.

Test-Time Linear Out-of-Distribution Detection
Ke Fan, Tong Liu, Xingyu Qiu, Yikai Wang, Lian Huai, Zeyu Shangguan, Shuang Gou,
 Fengjian Liu, Yuqian Fu, Yanwei Fu, Xingqun Jiang; Proceedings of the IEEE/CVF
Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 23752-23
761
Out-of-Distribution (OOD) detection aims to address the excessive confidence pre
diction by neural networks by triggering an alert when the input sample deviates
 significantly from the training distribution (in-distribution) indicating that
the output may not be reliable. Current OOD detection approaches explore all kin
ds of cues to identify OOD data such as finding irregular patterns in the featur
e space logit space gradient space or the raw image space. Surprisingly we obser

ve a linear trend between the OOD score produced by current OOD detection algorithms and the network features on several datasets. We conduct a thorough investigation theoretically and empirically to analyze and understand the meaning of such a linear trend in OOD detection. This paper proposes a Robust Test-time Linear method (RTL) to utilize such linear trends like a `free lunch' when we have a batch of data to perform OOD detection. By using a simple linear regression as a test time adaptation we can make a more precise OOD prediction. We further propose an online variant of the proposed method which achieves promising performance and is more practical for real applications. Theoretical analysis is given to prove the effectiveness of our methods. Extensive experiments on several OOD datasets show the efficacy of RTL for OOD detection tasks significantly improving the results of base OOD detectors. Project will be available at https://github.com/kfan21/RTL.

Guided Slot Attention for Unsupervised Video Object Segmentation
Minhyeok Lee, Suhwan Cho, Dogyoon Lee, Chaewon Park, Jungho Lee, Sangyoun Lee; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 3807-3816
Unsupervised video object segmentation aims to segment the most prominent object in a video sequence. However the existence of complex backgrounds and multiple foreground objects make this task challenging. To address this issue we propose a guided slot attention network to reinforce spatial structural information and obtain better foreground-background separation. The foreground and background slots which are initialized with query guidance are iteratively refined based on interactions with template information. Furthermore to improve slot-template interaction and effectively fuse global and local features in the target and reference frames K-nearest neighbors filtering and a feature aggregation transformer are introduced. The proposed model achieves state-of-the-art performance on two popular datasets. Additionally we demonstrate the robustness of the proposed model in challenging scenes through various comparative experiments.
****

Unsupervised Blind Image Deblurring Based on Self-Enhancement
Lufei Chen, Xiangpeng Tian, Shuhua Xiong, Yinjie Lei, Chao Ren; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 25691-25700
Significant progress in image deblurring has been achieved by deep learning methods especially the remarkable performance of supervised models on paired synthetic data. However real-world quality degradation is more complex than synthetic datasets and acquiring paired data in real-world scenarios poses significant challenges. To address these challenges we propose a novel unsupervised image deblurring framework based on self-enhancement. The framework progressively generates improved pseudo-sharp and blurry image pairs without the need for real paired datasets and the generated image pairs with higher qualities can be used to enhance the performance of the reconstructor. To ensure the generated blurry images are closer to the real blurry images we propose a novel re-degradation principal component consistency loss which enforces the principal components of the generated low-quality images to be similar to those of re-degraded images from the original sharp ones. Furthermore we introduce the self-enhancement strategy that significantly improves deblurring performance without increasing the computational complexity of network during inference. Through extensive experiments on multiple real-world blurry datasets we demonstrate the superiority of our approach over other state-of-the-art unsupervised methods.

Action Detection via an Image Diffusion Process
Lin Geng Foo, Tianjiao Li, Hossein Rahmani, Jun Liu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 18351-18361
Action detection aims to localize the starting and ending points of action instances in untrimmed videos and predict the classes of those instances. In this paper we make the observation that the outputs of the action detection task can be

formulated as images. Thus from a novel perspective we tackle action detection via a three-image generation process to generate starting point ending point and action-class predictions as images via our proposed Action Detection Image Diffusion (ADI-Diff) framework. Furthermore since our images differ from natural images and exhibit special properties we further explore a Discrete Action-Detection Diffusion Process and a Row-Column Transformer design to better handle their processing. Our ADI-Diff framework achieves state-of-the-art results on two widely-used datasets.

Programmable Motion Generation for Open-Set Motion Control Tasks
Hanchao Liu, Xiaohang Zhan, Shaoli Huang, Tai-Jiang Mu, Ying Shan; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 1399-1408
Character animation in real-world scenarios necessitates a variety of constraints such as trajectories key-frames interactions etc. Existing methodologies typically treat single or a finite set of these constraint(s) as separate control tasks. These methods are often specialized and the tasks they address are rarely extendable or customizable. We categorize these as solutions to the close-set motion control problem. In response to the complexity of practical motion control we propose and attempt to solve the open-set motion control problem. This problem is characterized by an open and fully customizable set of motion control tasks. To address this we introduce a new paradigm programmable motion generation. In this paradigm any given motion control task is broken down into a combination of atomic constraints. These constraints are then programmed into an error function that quantifies the degree to which a motion sequence adheres to them. We utilize a pre-trained motion generation model and optimize its latent code to minimize the error function of the generated motion. Consequently the generated motion not only inherits the prior of the generative model but also satisfies the requirements of the compounded constraints. Our experiments demonstrate that our approach can generate high-quality motions when addressing a wide range of unseen tasks. These tasks encompass motion control by motion dynamics geometric constraints physical laws interactions with scenes objects or the character's own body parts etc. All of these are achieved in a unified approach without the need for ad-hoc paired training data collection or specialized network designs. During the programming of novel tasks we observed the emergence of new skills beyond those of the prior model. With the assistance of large language models we also achieved automatic programming. We hope that this work will pave the way for the motion control of general AI agents.

SCE-MAE: Selective Correspondence Enhancement with Masked Autoencoder for Self-Supervised Landmark Estimation
Kejia Yin, Varshanth Rao, Ruowei Jiang, Xudong Liu, Parham Aarabi, David B. Lindell; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 1313-1322
Self-supervised landmark estimation is a challenging task that demands the formation of locally distinct feature representations to identify sparse facial landmarks in the absence of annotated data. To tackle this task existing state-of-the-art (SOTA) methods (1) extract coarse features from backbones that are trained with instance-level self-supervised learning (SSL) paradigms which neglect the dense prediction nature of the task (2) aggregate them into memory-intensive hypercolumn formations and (3) supervise lightweight projector networks to naively establish full local correspondences among all pairs of spatial features. In this paper we introduce SCE-MAE a framework that (1) leverages the MAE [??] a region-level SSL method that naturally better suits the landmark prediction task (2) operates on the vanilla feature map instead of on expensive hypercolumns and (3) employs a Correspondence Approximation and Refinement Block (CARB) that utilizes a simple density peak clustering algorithm and our proposed Locality-Constrained Repellence Loss to directly hone only select local correspondences. We demonstrate through extensive experiments that SCE-MAE is highly effective and robust outperforming existing SOTA methods by large margins of 20%-44% on the landmark m

atching and 9%-15% on the landmark detection tasks.

LAKE-RED: Camouflaged Images Generation by Latent Background Knowledge Retrieval-Augmented Diffusion
Pancheng Zhao, Peng Xu, Pengda Qin, Deng-Ping Fan, Zhicheng Zhang, Guoli Jia, Bowen Zhou, Jufeng Yang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 4092-4101
Camouflaged vision perception is an important vision task with numerous practical applications. Due to the expensive collection and labeling costs this community struggles with a major bottleneck that the species category of its datasets is limited to a small number of object species. However the existing camouflaged generation methods require specifying the background manually thus failing to extend the camouflaged sample diversity in a low-cost manner. In this paper we propose a Latent Background Knowledge Retrieval-Augmented Diffusion (LAKE-RED) for camouflaged image generation. To our knowledge our contributions mainly include: (1) For the first time we propose a camouflaged generation paradigm that does not need to receive any background inputs. (2) Our LAKE-RED is the first knowledge retrieval-augmented method with interpretability for camouflaged generation in which we propose an idea that knowledge retrieval and reasoning enhancement are separated explicitly to alleviate the task-specific challenges. Moreover our method is not restricted to specific foreground targets or backgrounds offering a potential for extending camouflaged vision perception to more diverse domains. (3) Experimental results demonstrate that our method outperforms the existing approaches generating more realistic camouflage images.

TIGER: Time-Varying Denoising Model for 3D Point Cloud Generation with Diffusion Process
Zhiyuan Ren, Minchul Kim, Feng Liu, Xiaoming Liu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 9462-9471
Recently diffusion models have emerged as a new powerful generative method for 3D point cloud generation tasks. However few works study the effect of the architecture of the diffusion model in the 3D point cloud resorting to the typical UNet model developed for 2D images. Inspired by the wide adoption of Transformers we study the complementary role of convolution (from UNet) and attention (from Transformers). We discover that their respective importance change according to the timestep in the diffusion process. At early stage attention has an outsized influence because Transformers are found to generate the overall shape more quickly and at later stages when adding fine detail convolution starts having a larger impact on the generated point cloud's local surface quality. In light of this observation we propose a time-varying two-stream denoising model combined with convolution layers and transformer blocks. We generate an optimizable mask from each timestep to reweigh global and local features obtaining time-varying fused features. Experimentally we demonstrate that our proposed method quantitatively outperforms other state-of-the-art methods regarding visual quality and diversity. Code is avaiable github.com/Zhiyuan-R/Tiger-Time-varying-Diffusion-Model-for-Point-Cloud-Generation.

ConTex-Human: Free-View Rendering of Human from a Single Image with Texture-Consistent Synthesis
Xiangjun Gao, Xiaoyu Li, Chaopeng Zhang, Qi Zhang, Yanpei Cao, Ying Shan, Long Quan; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 10084-10094
In this work we propose a method to address the challenge of rendering a 3D human from a single image in a free-view manner. Some existing approaches could achieve this by using generalizable pixel-aligned implicit fields to reconstruct a textured mesh of a human or by employing a 2D diffusion model as guidance with the Score Distillation Sampling (SDS) method to lift the 2D image into 3D space. However a generalizable implicit field often results in an over-smooth texture field while the SDS method tends to lead to a texture-inconsistent novel view with the input image. In this paper we introduce a texture-consistent back view synt

hesis method that could transfer the reference image content to the back view th
rough depth-guided mutual self-attention. With this method we could achieve high
-fidelity and texture-consistent human rendering from a single image. Moreover t
o alleviate the color distortion that occurs in the side region we propose a vi
sibility-aware patch consistency regularization combined with the synthesized b
ack view texture. Experiments conducted on both real and synthetic data demonstr
ate the effectiveness of our method and show that our approach outperforms previ
ous baseline methods.

UFineBench: Towards Text-based Person Retrieval with Ultra-fine Granularity
Jialong Zuo, Hanyu Zhou, Ying Nie, Feng Zhang, Tianyu Guo, Nong Sang, Yunhe Wang
, Changxin Gao; Proceedings of the IEEE/CVF Conference on Computer Vision and Pa
ttern Recognition (CVPR), 2024, pp. 22010-22019
Existing text-based person retrieval datasets often have relatively coarse-grain
ed text annotations. This hinders the model to comprehend the fine-grained seman
tics of query texts in real scenarios. To address this problem we contribute a n
ew benchmark named UFineBench for text-based person retrieval with ultra-fine gr
anularity. Firstly we construct a new dataset named UFine6926. We collect a larg
e number of person images and manually annotate each image with two detailed tex
tual descriptions averaging 80.8 words each. The average word count is three to
four times that of the previous datasets. In addition of standard in-domain eval
uation we also propose a special evaluation paradigm more representative of real
 scenarios. It contains a new evaluation set with cross domains cross textual gr
anularity and cross textual styles named UFine3C and a new evaluation metric for
 accurately measuring retrieval ability named mean Similarity Distribution (mSD)
. Moreover we propose CFAM a more efficient algorithm especially designed for te
xt-based person retrieval with ultra fine-grained texts. It achieves fine granul
arity mining by adopting a shared cross-modal granularity decoder and hard negat
ive match mechanism. With standard in-domain evaluation CFAM establishes competi
tive performance across various datasets especially on our ultra fine-grained UF
ine6926. Furthermore by evaluating on UFine3C we demonstrate that training on ou
r UFine6926 significantly improves generalization to real scenarios compared wit
h other coarse-grained datasets. The dataset and code will be made publicly avai
lable at https://github.com/Zplusdragon/UFineBench.

Efficient Hyperparameter Optimization with Adaptive Fidelity Identification
Jiantong Jiang, Zeyi Wen, Atif Mansoor, Ajmal Mian; Proceedings of the IEEE/CVF
Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 26181-26
190
Hyperparameter Optimization and Neural Architecture Search are powerful in attai
ning state-of-the-art machine learning models with Bayesian Optimization (BO) st
anding out as a mainstream method. Extending BO into the multi-fidelity setting
has been an emerging research topic in this field but faces the challenge of det
ermining an appropriate fidelity for each hyperparameter configuration to fit th
e surrogate model. To tackle the challenge we propose a multi-fidelity BO method
 named FastBO which excels in adaptively deciding the fidelity for each configur
ation and providing strong performance while ensuring efficient resource usage.
These advantages are achieved through our proposed techniques based on the conce
pts of efficient point and saturation point for each configuration which can be
obtained from the empirical learning curve of the configuration estimated from e
arly observations. Extensive experiments demonstrate FastBO's superior anytime p
erformance and efficiency in identifying high-quality configurations and archite
ctures. We also show that our method provides a way to extend any single-fidelit
y method to the multi-fidelity setting highlighting the wide applicability of ou
r approach.

ASH: Animatable Gaussian Splats for Efficient and Photoreal Human Rendering
Haokai Pang, Heming Zhu, Adam Kortylewski, Christian Theobalt, Marc Habermann; P
roceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition
 (CVPR), 2024, pp. 1165-1175

Real-time rendering of photorealistic and controllable human avatars stands as a cornerstone in Computer Vision and Graphics. While recent advances in neural implicit rendering have unlocked unprecedented photorealism for digital avatars real-time performance has mostly been demonstrated for static scenes only. To address this we propose ASH an animatable Gaussian splatting approach for photorealistic rendering of dynamic humans in real time. We parameterize the clothed human as animatable 3D Gaussians which can be efficiently splatted into image space to generate the final rendering. However naively learning the Gaussian parameters in 3D space poses a severe challenge in terms of compute. Instead we attach the Gaussians onto a deformable character model and learn their parameters in 2D texture space which allows leveraging efficient 2D convolutional architectures that easily scale with the required number of Gaussians. We benchmark ASH with competing methods on pose-controllable avatars demonstrating that our method outperforms existing real-time methods by a large margin and shows comparable or even better results than offline methods.
****
Focus on Hiders: Exploring Hidden Threats for Enhancing Adversarial Training
Qian Li, Yuxiao Hu, Yinpeng Dong, Dongxiao Zhang, Yuntian Chen; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 24442-24451
Adversarial training is often formulated as a min-max problem however concentrating only on the worst adversarial examples causes alternating repetitive confusion of the model i.e. previously defended or correctly classified samples are not defensible or accurately classifiable in subsequent adversarial training. We characterize such non-ignorable samples as "hiders" which reveal the hidden high-risk regions within the secure area obtained through adversarial training and prevent the model from finding the real worst cases. We demand the model to prevent hiders when defending against adversarial examples for improving accuracy and robustness simultaneously. By rethinking and redefining the min-max optimization problem for adversarial training we propose a generalized adversarial training algorithm called Hider-Focused Adversarial Training (HFAT). HFAT introduces the iterative evolution optimization strategy to simplify the optimization problem and employs an auxiliary model to reveal hiders effectively combining the optimization directions of standard adversarial training and prevention hiders. Furthermore we introduce an adaptive weighting mechanism that facilitates the model in adaptively adjusting its focus between adversarial examples and hiders during different training periods. We demonstrate the effectiveness of our method based on extensive experiments and ensure that HFAT can provide higher robustness and accuracy. We will release the source code upon publication.

ArtAdapter: Text-to-Image Style Transfer using Multi-Level Style Encoder and Explicit Adaptation
Dar-Yen Chen, Hamish Tennent, Ching-Wen Hsu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 8619-8628
This work introduces ArtAdapter a transformative text-to-image (T2I) style transfer framework that transcends traditional limitations of color brushstrokes and object shape capturing high-level style elements such as composition and distinctive artistic expression. The integration of a multi-level style encoder with our proposed explicit adaptation mechanism enables ArtAdapter to achieve unprecedented fidelity in style transfer ensuring close alignment with textual descriptions. Additionally the incorporation of an Auxiliary Content Adapter (ACA) effectively separates content from style alleviating the borrowing of content from style references. Moreover our novel fast finetuning approach could further enhance zero-shot style representation while mitigating the risk of overfitting. Comprehensive evaluations confirm that ArtAdapter surpasses current state-of-the-art methods.
****
GoodSAM: Bridging Domain and Capacity Gaps via Segment Anything Model for Distortion-aware Panoramic Semantic Segmentation
Weiming Zhang, Yexin Liu, Xu Zheng, Lin Wang; Proceedings of the IEEE/CVF Confer

ence on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 28264-28273
This paper tackles a novel yet challenging problem: how to transfer knowledge from the emerging Segment Anything Model (SAM) -- which reveals impressive zero-shot instance segmentation capacity -- to learn a compact panoramic semantic segmentation model i.e. student without requiring any labeled data. This poses considerable challenges due to SAM's inability to provide semantic labels and the large capacity gap between SAM and the student. To this end we propose a novel framework called GoodSAM that introduces a teacher assistant (TA) to provide semantic information integrated with SAM to generate ensemble logits to achieve knowledge transfer. Specifically we propose a Distortion-Aware Rectification (DAR) module that first addresses the distortion problem of panoramic images by imposing prediction-level consistency and boundary enhancement. This subtly enhances TA's prediction capacity on panoramic images. DAR then incorporates a cross-task complementary fusion block to adaptively merge the predictions of SAM and TA to obtain more reliable ensemble logits. Moreover we introduce a Multi-level Knowledge Adaptation (MKA) module to efficiently transfer the multi-level feature knowledge from TA and ensemble logits to learn a compact student model. Extensive experiments on two benchmarks show that our GoodSAM achieves a remarkable +3.75% mIoU improvement over the state-of-the-art (SOTA) domain adaptation methods e.g. [41]. Also our most lightweight model achieves comparable performance to the SOTA methods with only 3.7M parameters.

DYSON: Dynamic Feature Space Self-Organization for Online Task-Free Class Incremental Learning
Yuhang He, Yingjie Chen, Yuhan Jin, Songlin Dong, Xing Wei, Yihong Gong; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 23741-23751
In this paper we focus on a challenging Online Task-Free Class Incremental Learning (OTFCIL) problem. Different from the existing methods that continuously learn the feature space from data streams we propose a novel compute-and-align paradigm for the OTFCIL. It first computes an optimal geometry i.e. the class prototype distribution for classifying existing classes and updates it when new classes emerge and then trains a DNN model by aligning its feature space to the optimal geometry. To this end we develop a novel Dynamic Neural Collapse (DNC) algorithm to compute and update the optimal geometry. The DNC expands the geometry when new classes emerge without loss of the geometry optimality and guarantees the drift distance of old class prototypes with an explicit upper bound. Then we propose a novel Dynamic feature space Self-Organization (DYSON) method containing three major components including 1) a feature extractor 2) a Dynamic Feature-Geometry Alignment (DFGA) module aligning the feature space to the optimal geometry computed by DNC and 3) a training-free class-incremental classifier derived from the DNC geometry. Experimental comparison results on four benchmark datasets including CIFAR10 CIFAR100 CUB200 and CoRe50 demonstrate the efficiency and superiority of the DYSON method. The source code is provided in the supplementary material.

Streaming Dense Video Captioning
Xingyi Zhou, Anurag Arnab, Shyamal Buch, Shen Yan, Austin Myers, Xuehan Xiong, Arsha Nagrani, Cordelia Schmid; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 18243-18252
An ideal model for dense video captioning -- predicting captions localized temporally in a video -- should be able to handle long input videos predict rich detailed textual descriptions and be able to produce outputs before processing the entire video. Current state-of-the-art models however process a fixed number of downsampled frames and make a single full prediction after seeing the whole video. We propose a streaming dense video captioning model that consists of two novel components: First we propose a new memory module based on clustering incoming tokens which can handle arbitrarily long videos as the memory is of a fixed size. Second we develop a streaming decoding algorithm that enables our model to make predictions before the entire video has been processed. Our model achieves this

streaming ability and significantly improves the state-of-the-art on three dense video captioning benchmarks: ActivityNet YouCook2 and ViTT. Our code is released at https://github.com/google-research/scenic.

Rethinking Inductive Biases for Surface Normal Estimation
Gwangbin Bae, Andrew J. Davison; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 9535-9545
Despite the growing demand for accurate surface normal estimation models existing methods use general-purpose dense prediction models adopting the same inductive biases as other tasks. In this paper we discuss the inductive biases needed for surface normal estimation and propose to (1) utilize the per-pixel ray direction and (2) encode the relationship between neighboring surface normals by learning their relative rotation. The proposed method can generate crisp - yet piecewise smooth - predictions for challenging in-the-wild images of arbitrary resolution and aspect ratio. Compared to a recent ViT-based state-of-the-art model our method shows a stronger generalization ability despite being trained on an orders of magnitude smaller dataset. The code is available at https://github.com/baegwangbin/DSINE.

Event-based Structure-from-Orbit
Ethan Elms, Yasir Latif, Tae Ha Park, Tat-Jun Chin; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 19541-19550
Event sensors offer high temporal resolution visual sensing which makes them ideal for perceiving fast visual phenomena without suffering from motion blur. Certain applications in robotics and vision-based navigation require 3D perception of an object undergoing circular or spinning motion in front of a static camera such as recovering the angular velocity and shape of the object. The setting is equivalent to observing a static object with an orbiting camera. In this paper we propose event-based structure-from-orbit (eSfO) where the aim is to simultaneously reconstruct the 3D structure of a fast spinning object observed from a static event camera and recover the equivalent orbital motion of the camera. Our contributions are threefold: since state-of-the-art event feature trackers cannot handle periodic self-occlusion due to the spinning motion we develop a novel event feature tracker based on spatio-temporal clustering and data association that can better track the helical trajectories of valid features in the event data. The feature tracks are then fed to our novel factor graph-based structure-from-orbit back-end that calculates the orbital motion parameters (e.g. spin rate relative rotational axis) that minimize the reprojection error. For evaluation we produce a new event dataset of objects under spinning motion. Comparisons against ground truth indicate the efficacy of eSfO.

LED: A Large-scale Real-world Paired Dataset for Event Camera Denoising
Yuxing Duan; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 25637-25647
Event camera has significant advantages in capturingdynamic scene information while being prone to noise interferenceparticularly in challenging conditions like lowthreshold and low illumination. However most existing researchfocuses on gentle situations hindering event cameraapplications in realistic complex scenarios. To tackle thislimitation and advance the field we construct a new pairedreal-world event denoising dataset (LED) including 3K sequenceswith 18K seconds of high-resolution (1200*680)event streams and showing three notable distinctions comparedto others: diverse noise levels and scenes largerscalewith high-resolution and high-quality GT. Specificallyit contains stepped parameters and varying illuminationwith diverse scenarios. Moreover based on theproperty of noise events inconsistency and signal eventsconsistency we propose a novel effective denoising framework(DED) using homogeneous dual events to generate theGT with better separating noise from the raw. Furthermorewe design a bio-inspired baseline leveraging Leaky-Integrate-and-Fire (LIF) neurons with dynamic thresholdsto realize accurate denoising. The experimental resultsdemonstrate that the remarkable performanc

e of the proposedapproach on different datasets.The dataset and codeare at https ://github.com/Yee-Sing/led.

Fair Federated Learning under Domain Skew with Local Consistency and Domain Dive rsity
Yuhang Chen, Wenke Huang, Mang Ye; Proceedings of the IEEE/CVF Conference on Com puter Vision and Pattern Recognition (CVPR), 2024, pp. 12077-12086
Federated learning (FL) has emerged as a new paradigm for privacy-preserving col laborative training. Under domain skew the current FL approaches are biased and face two fairness problems. 1) Parameter Update Conflict: data disparity among c lients leads to varying parameter importance and inconsistent update directions. These two disparities cause important parameters to potentially be overwhelmed by unimportant ones of dominant updates. It consequently results in significant performance decreases for lower-performing clients. 2) Model Aggregation Bias: e xisting FL approaches introduce unfair weight allocation and neglect domain dive rsity. It leads to biased model convergence objective and distinct performance a mong domains. We discover a pronounced directional update consistency in Federat ed Learning and propose a novel framework to tackle above issues. First leveragi ng the discovered characteristic we selectively discard unimportant parameter up dates to prevent updates from clients with lower performance overwhelmed by unim portant parameters resulting in fairer generalization performance. Second we pro pose a fair aggregation objective to prevent global model bias towards some doma ins ensuring that the global model continuously aligns with an unbiased model. T he proposed method is generic and can be combined with other existing FL methods to enhance fairness. Comprehensive experiments on Digits and Office-Caltech dem onstrate the high fairness and performance of our method.

Activity-Biometrics: Person Identification from Daily Activities
Shehreen Azad, Yogesh Singh Rawat; Proceedings of the IEEE/CVF Conference on Com puter Vision and Pattern Recognition (CVPR), 2024, pp. 287-296
In this work we study a novel problem which focuses on person identification whi le performing daily activities. Learning biometric features from RGB videos is c hallenging due to spatio-temporal complexity and presence of appearance biases s uch as clothing color and background. We propose ABNet a novel framework which l everages disentanglement of biometric and non-biometric features to perform effe ctive person identification from daily activities. ABNet relies on a bias-less t eacher to learn biometric features from RGB videos and explicitly disentangle no n-biometric features with the help of biometric distortion. In addition ABNet al so exploits activity prior for biometrics which is enabled by joint biometric an d activity learning. We perform comprehensive evaluation of the proposed approac h across five different datasets which are derived from existing activity recogn ition benchmarks. Furthermore we extensively compare ABNet with existing works i n person identification and demonstrate its effectiveness for activity-based bio metrics across all five datasets. The code and dataset can be accessed at: https ://github.com/sacrcv/Activity-Biometrics/

Z*: Zero-shot Style Transfer via Attention Reweighting
Yingying Deng, Xiangyu He, Fan Tang, Weiming Dong; Proceedings of the IEEE/CVF C onference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 6934-6944
Despite the remarkable progress in image style transfer formulating style in the context of art is inherently subjective and challenging. In contrast to existin g methods this study shows that vanilla diffusion models can directly extract st yle information and seamlessly integrate the generative prior into the content i mage without retraining. Specifically we adopt dual denoising paths to represent content/style references in latent space and then guide the content image denoi sing process with style latent codes. We further reveal that the cross-attention mechanism in latent diffusion models tends to blend the content and style image s resulting in stylized outputs that deviate from the original content image. To overcome this limitation we introduce a cross-attention reweighting strategy. T hrough theoretical analysis and experiments we demonstrate the effectiveness and

superiority of the diffusion-based zero-shot style transfer via attention reweighting Z-STAR.

HIG: Hierarchical Interlacement Graph Approach to Scene Graph Generation in Video Understanding
Trong-Thuan Nguyen, Pha Nguyen, Khoa Luu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 18384-18394
Visual interactivity understanding within visual scenes presents a significant challenge in computer vision. Existing methods focus on complex interactivities while leveraging a simple relationship model. These methods however struggle with a diversity of appearance situation position interaction and relation in videos. This limitation hinders the ability to fully comprehend the interplay within the complex visual dynamics of subjects. In this paper we delve into interactivities understanding within visual content by deriving scene graph representations from dense interactivities among humans and objects. To achieve this goal we first present a new dataset containing Appearance-Situation-Position-Interaction-Relation predicates named ASPIRe offering an extensive collection of videos marked by a wide range of interactivities. Then we propose a new approach named Hierarchical Interlacement Graph (HIG) which leverages a unified layer and graph within a hierarchical structure to provide deep insights into scene changes across five distinct tasks. Our approach demonstrates superior performance to other methods through extensive experiments conducted in various scenarios.

OOSTraj: Out-of-Sight Trajectory Prediction With Vision-Positioning Denoising
Haichao Zhang, Yi Xu, Hongsheng Lu, Takayuki Shimizu, Yun Fu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 14802-14811
Trajectory prediction is fundamental in computer vision and autonomous driving particularly for understanding pedestrian behavior and enabling proactive decision-making. Existing approaches in this field often assume precise and complete observational data neglecting the challenges associated with out-of-view objects and the noise inherent in sensor data due to limited camera range physical obstructions and the absence of ground truth for denoised sensor data. Such oversights are critical safety concerns as they can result in missing essential non-visible objects. To bridge this gap we present a novel method for out-of-sight trajectory prediction that leverages a vision-positioning technique. Our approach denoises noisy sensor observations in an unsupervised manner and precisely maps sensor-based trajectories of out-of-sight objects into visual trajectories. This method has demonstrated state-of-the-art performance in out-of-sight noisy sensor trajectory denoising and prediction on the Vi-Fi and JRDB datasets. By enhancing trajectory prediction accuracy and addressing the challenges of out-of-sight objects our work significantly contributes to improving the safety and reliability of autonomous driving in complex environments. Our work represents the first initiative towards Out-Of-Sight Trajectory prediction (OOSTraj) setting a new benchmark for future research.

FADES: Fair Disentanglement with Sensitive Relevance
Taeuk Jang, Xiaoqian Wang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 12067-12076
Learning fair representation in deep learning is essential to mitigate discriminatory outcomes and enhance trustworthiness. However previous research has been commonly established on inappropriate assumptions prone to unrealistic counterfactuals and performance degradation. Although some proposed alternative approaches such as employing correlation-aware causal graphs or proxies for mutual information these methods are less practical and not applicable in general. In this work we propose FAir DisEntanglement with Sensitive relevance (FADES) a novel approach that leverages conditional mutual information from the information theory perspective to address these challenges. We employ sensitive relevant code to direct correlated information between target labels and sensitive attributes by imposing conditional independence allowing better separation of the features of inte

rest in the latent space. Utilizing an intuitive disentangling approach FADES co
nsistently achieves superior performance and fairness both quantitatively and qu
alitatively with its straightforward structure. Specifically the proposed method
 outperforms existing works in downstream classification and counterfactual gene
rations on various benchmarks.

Learning Continuous 3D Words for Text-to-Image Generation
Ta-Ying Cheng, Matheus Gadelha, Thibault Groueix, Matthew Fisher, Radomir Mech,
Andrew Markham, Niki Trigoni; Proceedings of the IEEE/CVF Conference on Computer
 Vision and Pattern Recognition (CVPR), 2024, pp. 6753-6762
Current controls over diffusion models (e.g. through text or ControlNet) for ima
ge generation fall short in recognizing abstract continuous attributes like illu
mination direction or non-rigid shape change. In this paper we present an approa
ch for allowing users of text-to-image models to have fine-grained control of se
veral attributes in an image. We do this by engineering special sets of input to
kens that can be transformed in a continuous manner we call them Continuous 3D W
ords. These attributes can for example be represented as sliders and applied joi
ntly with text prompts for fine-grained control over image generation. Given onl
y a single mesh and a rendering engine we show that our approach can be adopted
to provide continuous user control over several 3D-aware attributes including ti
me-of-day illumination bird wing orientation dollyzoom effect and object poses.
Our method is capable of conditioning image creation with multiple Continuous 3D
 Words and text descriptions simultaneously while adding no overhead to the gene
rative process.
****
MarkovGen: Structured Prediction for Efficient Text-to-Image Generation
Sadeep Jayasumana, Daniel Glasner, Srikumar Ramalingam, Andreas Veit, Ayan Chakr
abarti, Sanjiv Kumar; Proceedings of the IEEE/CVF Conference on Computer Vision
and Pattern Recognition (CVPR), 2024, pp. 9316-9325
Modern text-to-image generation models produce high-quality images that are both
 photorealistic and faithful to the text prompts. However this quality comes at
significant computational cost: nearly all of these models are iterative and req
uire running sampling multiple times with large models. This iterative process i
s needed to ensure that different regions of the image are not only aligned with
 the text prompt but also compatible with each other. In this work we propose a
light-weight approach to achieving this compatibility between different regions
of an image using a Markov Random Field (MRF) model. We demonstrate the effectiv
eness of this method on top of the latent token-based Muse text-to-image model.
The MRF richly encodes the compatibility among image tokens at different spatial
 locations to improve quality and significantly reduce the required number of Mu
se sampling steps. Inference with the MRF is significantly cheaper and its param
eters can be quickly learned through back-propagation by modeling MRF inference
as a differentiable neural-network layer. Our full model MarkovGen uses this pro
posed MRF model to both speed up Muse by 1.5xand produce higher quality images b
y decreasing undesirable image artifacts.

Self-Supervised Class-Agnostic Motion Prediction with Spatial and Temporal Consi
stency Regularizations
Kewei Wang, Yizheng Wu, Jun Cen, Zhiyu Pan, Xingyi Li, Zhe Wang, Zhiguo Cao, Guo
sheng Lin; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern
 Recognition (CVPR), 2024, pp. 14638-14647
The perception of motion behavior in a dynamic environment holds significant imp
ortance for autonomous driving systems wherein class-agnostic motion prediction
methods directly predict the motion of the entire point cloud. While most existi
ng methods rely on fully-supervised learning the manual labeling of point cloud
data is laborious and time-consuming. Therefore several annotation-efficient met
hods have been proposed to address this challenge. Although effective these meth
ods rely on weak annotations or additional multi-modal data like images and the
potential benefits inherent in the point cloud sequence are still underexplored.
 To this end we explore the feasibility of self-supervised motion prediction wit

h only unlabeled LiDAR point clouds. Initially we employ an optimal transport solver to establish coarse correspondences between current and future point clouds as the coarse pseudo motion labels. Training models directly using such coarse labels leads to noticeable spatial and temporal prediction inconsistencies. To mitigate these issues we introduce three simple spatial and temporal regularization losses which facilitate the self-supervised training process effectively. Experimental results demonstrate the significant superiority of our approach over the state-of-the-art self-supervised methods. Code will be available.

HashPoint: Accelerated Point Searching and Sampling for Neural Rendering
Jiahao Ma, Miaomiao Liu, David Ahmedt-Aristizabal, Chuong Nguyen; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 4462-4472
In this paper we address the problem of efficient point searching and sampling for volume neural rendering. Within this realm two typical approaches are employed: rasterization and ray tracing. The rasterization-based methods enable real-time rendering at the cost of increased memory and lower fidelity. In contrast the ray-tracing-based methods yield superior quality but demand longer rendering time. We solve this problem by our HashPoint method combining these two strategies leveraging rasterization for efficient point searching and sampling and ray marching for rendering. Our method optimizes point searching by rasterizing points within the camera's view organizing them in a hash table and facilitating rapid searches. Notably we accelerate the rendering process by adaptive sampling on the primary surface encountered by the ray. Our approach yields substantial speed-up for a range of state-of-the-art ray-tracing-based methods maintaining equivalent or superior accuracy across synthetic and real test datasets. The code will be available at https://jiahao-ma.github.io/hashpoint/

MFP: Making Full Use of Probability Maps for Interactive Image Segmentation
Chaewon Lee, Seon-Ho Lee, Chang-Su Kim; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 4051-4059
In recent interactive segmentation algorithms previous probability maps are used as network input to help predictions in the current segmentation round. However despite the utilization of previous masks useful information contained in the probability maps is not well propagated to the current predictions. In this paper to overcome this limitation we propose a novel and effective algorithm for click-based interactive image segmentation called MFP which attempts to make full use of probability maps. We first modulate previous probability maps to enhance their representations of user-specified objects. Then we feed the modulated probability maps as additional input to the segmentation network. We implement the proposed MFP algorithm based on the ResNet-34 HRNet-18 and ViT-B backbones and assess the performance extensively on various datasets. It is demonstrated that MFP meaningfully outperforms the existing algorithms using identical backbones. The source codes are available at https://github.com/cwlee00/MFP.

CAT: Exploiting Inter-Class Dynamics for Domain Adaptive Object Detection
Mikhail Kennerley, Jian-Gang Wang, Bharadwaj Veeravalli, Robby T. Tan; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 16541-16550
Domain adaptive object detection aims to adapt detection models to domains where annotated data is unavailable. Existing methods have been proposed to address the domain gap using the semi-supervised student-teacher framework. However a fundamental issue arises from the class imbalance in the labelled training set which can result in inaccurate pseudo-labels. The relationship between classes especially where one class is a majority and the other minority has a large impact on class bias. We propose Class-Aware Teacher (CAT) to address the class bias issue in the domain adaptation setting. In our work we approximate the class relationships with our Inter-Class Relation module (ICRm) and exploit it to reduce the bias within the model. In this way we are able to apply augmentations to highly related classes both inter- and intra-domain to boost the performance of minorit

y classes while having minimal impact on majority classes. We further reduce the bias by implementing a class-relation weight to our classification loss. Experiments conducted on various datasets and ablation studies show that our method is able to address the class bias in the domain adaptation setting. On the Cityscapes ? Foggy Cityscapes dataset we attained a 52.5 mAP a substantial improvement over the 51.2 mAP achieved by the state-of-the-art method.
****
StyLitGAN: Image-Based Relighting via Latent Control
Anand Bhattad, James Soole, D.A. Forsyth; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 4231-4240
We describe a novel method StyLitGAN for relighting and resurfacing images in the absence of labeled data. StyLitGAN generates images with realistic lighting effects including cast shadows soft shadows inter-reflections and glossy effects without the need for paired or CGI data. StyLitGAN uses an intrinsic image method to decompose an image followed by a search of the latent space of a pretrained StyleGAN to identify a set of directions. By prompting the model to fix one component (e.g. albedo) and vary another (e.g. shading) we generate relighted images by adding the identified directions to the latent style codes. Quantitative metrics of change in albedo and lighting diversity allow us to choose effective directions using a forward selection process. Qualitative evaluation confirms the effectiveness of our method.

An Empirical Study of Scaling Law for Scene Text Recognition
Miao Rang, Zhenni Bi, Chuanjian Liu, Yunhe Wang, Kai Han; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 15619-15629
The laws of model size data volume computation and model performance have been extensively studied in the field of Natural Language Processing (NLP). However the scaling laws in Scene Text Recognition (STR) have not yet been investigated. To address this we conducted comprehensive studies that involved examining the correlations between performance and the scale of models data volume and computation in the field of text recognition. Conclusively the study demonstrates smooth power laws between performance and model size as well as training data volume when other influencing factors are held constant. Additionally we have constructed a large-scale dataset called REBU-Syn which comprises 6 million real samples and 18 million synthetic samples. Based on our scaling law and new dataset we have successfully trained a scene text recognition model achieving a new state-of-the-art on 6 common test benchmarks with a top-1 average accuracy of 97.42%. The models and dataset are publicly available at \href https://github.com/large-ocr-model/large-ocr-model.github.io large-ocr-model.github.io .

Text2Loc: 3D Point Cloud Localization from Natural Language
Yan Xia, Letian Shi, Zifeng Ding, Joao F. Henriques, Daniel Cremers; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 14958-14967
We tackle the problem of 3D point cloud localization based on a few natural linguistic descriptions and introduce a novel neural network Text2Loc that fully interprets the semantic relationship between points and text. Text2Loc follows a coarse-to-fine localization pipeline: text-submap global place recognition followed by fine localization. In global place recognition relational dynamics among each textual hint are captured in a hierarchical transformer with max-pooling (HTM) whereas a balance between positive and negative pairs is maintained using text-submap contrastive learning. Moreover we propose a novel matching-free fine localization method to further refine the location predictions which completely removes the need for complicated text-instance matching and is lighter faster and more accurate than previous methods. Extensive experiments show that Text2Loc improves the localization accuracy by up to 2x over the state-of-the-art on the KITTI360Pose dataset. Our project page is publicly available at: https: //yan-xia.github.io/projects/text2loc/.

SVDinsTN: A Tensor Network Paradigm for Efficient Structure Search from Regulari zed Modeling Perspective
Yu-Bang Zheng, Xi-Le Zhao, Junhua Zeng, Chao Li, Qibin Zhao, Heng-Chao Li, Ting-Zhu Huang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 26254-26263
Tensor network (TN) representation is a powerful technique for computer vision a nd machine learning. TN structure search (TN-SS) aims to search for a customized structure to achieve a compact representation which is a challenging NP-hard pr oblem. Recent "sampling-evaluation"-based methods require sampling an extensive collection of structures and evaluating them one by one resulting in prohibitive ly high computational costs. To address this issue we propose a novel TN paradig m named SVD-inspired TN decomposition (SVDinsTN) which allows us to efficiently solve the TN-SS problem from a regularized modeling perspective eliminating the repeated structure evaluations. To be specific by inserting a diagonal factor fo r each edge of the fully-connected TN SVDinsTN allows us to calculate TN cores a nd diagonal factors simultaneously with the factor sparsity revealing a compact TN structure. In theory we prove a convergence guarantee for the proposed method . Experimental results demonstrate that the proposed method achieves approximate ly 100 1000 times acceleration compared to the state-of-the-art TN-SS methods wh ile maintaining a comparable level of representation ability.

Decomposing Disease Descriptions for Enhanced Pathology Detection: A Multi-Aspec t Vision-Language Pre-training Framework
Vu Minh Hieu Phan, Yutong Xie, Yuankai Qi, Lingqiao Liu, Liyang Liu, Bowen Zhang , Zhibin Liao, Qi Wu, Minh-Son To, Johan W. Verjans; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 11492-1 1501
Medical vision language pre-training (VLP) has emerged as a frontier of research enabling zero-shot pathological recognition by comparing the query image with t he textual descriptions for each disease. Due to the complex semantics of biomed ical texts current methods struggle to align medical images with key pathologica l findings in unstructured reports. This leads to the misalignment with the targ et disease's textual representation. In this paper we introduce a novel VLP fram ework designed to dissect disease descriptions into their fundamental aspects le veraging prior knowledge about the visual manifestations of pathologies. This is achieved by consulting a large language model and medical experts. Integrating a Transformer module our approach aligns an input image with the diverse element s of a disease generating aspect-centric image representations. By consolidating the matches from each aspect we improve the compatibility between an image and its associated disease. Additionally capitalizing on the aspect-oriented represe ntations we present a dual-head Transformer tailored to process known and unknow n diseases optimizing the comprehensive detection efficacy. Conducting experimen ts on seven downstream datasets ours improves the accuracy of recent methods by up to 8.56% and 17.26% for seen and unseen categories respectively. Our code is released at https://github.com/HieuPhan33/MAVL.

MoMask: Generative Masked Modeling of 3D Human Motions
Chuan Guo, Yuxuan Mu, Muhammad Gohar Javed, Sen Wang, Li Cheng; Proceedings of t he IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 1900-1910
We introduce MoMask a novel masked modeling framework for text-driven 3D human m otion generation. In MoMask a hierarchical quantization scheme is employed to re present human motion as multi-layer discrete motion tokens with high-fidelity de tails. Starting at the base layer with a sequence of motion tokens obtained by v ector quantization the residual tokens of increasing orders are derived and stor ed at the subsequent layers of the hierarchy. This is consequently followed by t wo distinct bidirectional transformers. For the base-layer motion tokens a Maske d Transformer is designated to predict randomly masked motion tokens conditioned on text input at training stage. During generation (i.e. inference) stage start ing from an empty sequence our Masked Transformer iteratively fills up the missi

ng tokens; Subsequently a Residual Transformer learns to progressively predict the next-layer tokens based on the results from current layer. Extensive experiments demonstrate that MoMask outperforms the state-of-art methods on the text-to-motion generation task with an FID of 0.045 (vs e.g. 0.141 of T2M-GPT) on the HumanML3D dataset and 0.228 (vs 0.514) on KIT-ML respectively. MoMask can also be seamlessly applied in related tasks without further model fine-tuning such as text-guided temporal inpainting.

Inverse Rendering of Glossy Objects via the Neural Plenoptic Function and Radiance Fields
Haoyuan Wang, Wenbo Hu, Lei Zhu, Rynson W.H. Lau; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 19999-20008
Inverse rendering aims at recovering both geometry and materials of objects. It provides a more compatible reconstruction for conventional rendering engines compared with the neural radiance fields (NeRFs). On the other hand existing NeRF-based inverse rendering methods cannot handle glossy objects with local light interactions well as they typically oversimplify the illumination as a 2D environmental map which assumes infinite lights only. Observing the superiority of NeRFs in recovering radiance fields we propose a novel 5D Neural Plenoptic Function (NeP) based on NeRFs and ray tracing such that more accurate lighting-object interactions can be formulated via the rendering equation. We also design a material-aware cone sampling strategy to efficiently integrate lights inside the BRDF lobes with the help of pre-filtered radiance fields. Our method has two stages: the geometry of the target object and the pre-filtered environmental radiance fields are reconstructed in the first stage and materials of the target object are estimated in the second stage with the proposed NeP and material-aware cone sampling strategy. Extensive experiments on the proposed real-world and synthetic datasets demonstrate that our method can reconstruct high-fidelity geometry/materials of challenging glossy objects with complex lighting interactions from nearby objects. Project webpage: https://whyy.site/paper/nep

Split to Merge: Unifying Separated Modalities for Unsupervised Domain Adaptation
Xinyao Li, Yuke Li, Zhekai Du, Fengling Li, Ke Lu, Jingjing Li; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 23364-23374
Large vision-language models (VLMs) like CLIP have demonstrated good zero-shot learning performance in the unsupervised domain adaptation task. Yet most transfer approaches for VLMs focus on either the language or visual branches overlooking the nuanced interplay between both modalities. In this work we introduce a Unified Modality Separation (UniMoS) framework for unsupervised domain adaptation. Leveraging insights from modality gap studies we craft a nimble modality separation network that distinctly disentangles CLIP's features into language-associated and vision-associated components. Our proposed Modality-Ensemble Training (MET) method fosters the exchange of modality-agnostic information while maintaining modality-specific nuances. We align features across domains using a modality discriminator. Comprehensive evaluations on three benchmarks reveal our approach sets a new state-of-the-art with minimal computational costs. Code: https://github.com/TL-UESTC/UniMoS.

Fitting Flats to Flats
Gabriel Dogadov, Ugo Finnendahl, Marc Alexa; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 5439-5447
Affine subspaces of Euclidean spaces are also referred to as flats. A standard task in computer vision or more generally in engineering and applied sciences is fitting a flat to a set of points which is commonly solved using the PCA. We generalize this technique to enable fitting a flat to a set of other flats possibly of varying dimensions based on representing the flats as squared distance fields. Compared to previous approaches such as Riemannian centers of mass in the manifold of affine Grassmannians our approach is conceptually much simpler and comp

utationally more efficient yet offers desirable properties such as respecting sy
mmetries and being equivariant to rigid transformations leading to more intuitiv
e and useful results in practice. We demonstrate these claims in a number of syn
thetic experiments and a multi-view reconstruction task of line-like objects.

Coupled Laplacian Eigenmaps for Locally-Aware 3D Rigid Point Cloud Matching
Matteo Bastico, Etienne Decencière, Laurent Corté, Yannick Tillier, David Ryckel
ynck; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Reco
gnition (CVPR), 2024, pp. 3447-3458
Point cloud matching a crucial technique in computer vision medical and robotics
 fields is primarily concerned with finding correspondences between pairs of poi
nt clouds or voxels. In some practical scenarios emphasizing local differences i
s crucial for accurately identifying a correct match thereby enhancing the overa
ll robustness and reliability of the matching process. Commonly used shape descr
iptors have several limitations and often fail to provide meaningful local insig
hts about the paired geometries. In this work we propose a new technique based o
n graph Laplacian eigenmaps to match point clouds by taking into account fine lo
cal structures. To deal with the order and sign ambiguity of Laplacian eigenmaps
 we introduce a new operator called Coupled Laplacian that allows to easily gene
rate aligned eigenspaces for multiple registered geometries. We show that the si
milarity between those aligned high-dimensional spaces provides a locally meanin
gful score to match shapes. We firstly evaluate the performance of the proposed
technique in a point-wise manner focusing on the task of object anomaly localiza
tion on the MVTec 3D-AD dataset. Additionally we define a new medical task calle
d automatic Bone Side Estimation (BSE) which we address through a global similar
ity score derived from coupled eigenspaces. In order to test it we propose a ben
chmark collecting bone surface structures from various public datasets. Our matc
hing technique based on Coupled Laplacian outperforms other methods by reaching
an impressive accuracy on both tasks.

Overcoming Generic Knowledge Loss with Selective Parameter Update
Wenxuan Zhang, Paul Janson, Rahaf Aljundi, Mohamed Elhoseiny; Proceedings of the
 IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp
. 24046-24056
Foundation models encompass an extensive knowledge base and offer remarkable tra
nsferability. However this knowledge becomes outdated or insufficient over time.
 The challenge lies in continuously updating foundation models to accommodate no
vel information while retaining their original capabilities. Leveraging the fact
 that foundation models have initial knowledge on various tasks and domains we p
ropose a novel approach that instead of updating all parameters equally localize
s the updates to a sparse set of parameters relevant to the task being learned.
We strike a balance between efficiency and new task performance while maintainin

g the transferability and generalizability of foundation models. We extensively evaluate our method on foundational vision-language models with a diverse spectrum of continual learning tasks. Our method achieves improvements on the accuracy of the newly learned tasks up to 7% while preserving the pretraining knowledge with a negligible decrease of 0.9% on a representative control set accuracy.

Desigen: A Pipeline for Controllable Design Template Generation
Haohan Weng, Danqing Huang, Yu Qiao, Zheng Hu, Chin-Yew Lin, Tong Zhang, C. L. Philip Chen; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 12721-12732
Templates serve as a good starting point to implement a design (e.g. banner slide) but it takes great effort from designers to manually create. In this paper we present Desigen an automatic template creation pipeline which generates background images as well as harmonious layout elements over the background. Different from natural images a background image should preserve enough non-salient space for the overlaying layout elements. To equip existing advanced diffusion-based models with stronger spatial control we propose two simple but effective techniques to constrain the saliency distribution and reduce the attention weight in desired regions during the background generation process. Then conditioned on the background we synthesize the layout with a Transformer-based autoregressive generator. To achieve a more harmonious composition we propose an iterative inference strategy to adjust the synthesized background and layout in multiple rounds. We constructed a design dataset with more than 40k advertisement banners to verify our approach. Extensive experiments demonstrate that the proposed pipeline generates high-quality templates comparable to human designers. More than a single-page design we further show an application of presentation generation that outputs a set of theme-consistent slides. The data and code are available at https://whaohan.github.io/desigen.

Diff-BGM: A Diffusion Model for Video Background Music Generation
Sizhe Li, Yiming Qin, Minghang Zheng, Xin Jin, Yang Liu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 27348-27357
When editing a video a piece of attractive background music is indispensable. However video background music generation tasks face several challenges for example the lack of suitable training datasets and the difficulties in flexibly controlling the music generation process and sequentially aligning the video and music. In this work we first propose a high-quality music-video dataset BGM909 with detailed annotation and shot detection to provide multi-modal information about the video and music. We then present evaluation metrics to assess music quality including music diversity and alignment between music and video with retrieval precision metrics. Finally we propose the Diff-BGM framework to automatically generate the background music for a given video which uses different signals to control different aspects of the music during the generation process i.e. uses dynamic video features to control music rhythm and semantic features to control the melody and atmosphere. We propose to align the video and music sequentially by introducing a segment-aware cross-attention layer. Experiments verify the effectiveness of our proposed method. The code and models are available at https://github.com/sizhelee/Diff-BGM.

Looking Similar Sounding Different: Leveraging Counterfactual Cross-Modal Pairs for Audiovisual Representation Learning
Nikhil Singh, Chih-Wei Wu, Iroro Orife, Mahdi Kalayeh; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 26907-26918
Audiovisual representation learning typically relies on the correspondence between sight and sound. However there are often multiple audio tracks that can correspond with a visual scene. Consider for example different conversations on the same crowded street. The effect of such counterfactual pairs on audiovisual representation learning has not been previously explored. To investigate this we use

dubbed versions of movies and television shows to augment cross-modal contrastiv
e learning. Our approach learns to represent alternate audio tracks differing on
ly in speech similarly to the same video. Our results from a comprehensive set o
f experiments investigating different training strategies show this general appr
oach improves performance on a range of downstream auditory and audiovisual task
s without majorly affecting linguistic task performance overall. These findings
highlight the importance of considering speech variation when learning scene-lev
el audiovisual correspondences and suggest that dubbed audio can be a useful aug
mentation technique for training audiovisual models toward more robust performan
ce on diverse downstream tasks.

Multi-criteria Token Fusion with One-step-ahead Attention for Efficient Vision T
ransformers
Sanghyeok Lee, Joonmyung Choi, Hyunwoo J. Kim; Proceedings of the IEEE/CVF Confe
rence on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 15741-15750
Vision Transformer (ViT) has emerged as a prominent backbone for computer vision
. For more efficient ViTs recent works lessen the quadratic cost of the self-att
ention layer by pruning or fusing the redundant tokens. However these works face
d the speed-accuracy trade-off caused by the loss of information. Here we argue
that token fusion needs to consider diverse relations between tokens to minimize
 information loss. In this paper we propose a Multi-criteria Token Fusion (MCTF)
 that gradually fuses the tokens based on multi-criteria (i.e. similarity inform
ativeness and size of fused tokens). Further we utilize the one-step-ahead atten
tion which is the improved approach to capture the informativeness of the tokens
. By training the model equipped with MCTF using a token reduction consistency w
e achieve the best speed-accuracy trade-off in the image classification (ImageNe
t1K). Experimental results prove that MCTF consistently surpasses the previous r
eduction methods with and without training. Specifically DeiT-T and DeiT-S with
MCTF reduce FLOPs by about 44% while improving the performance (+0.5% and +0.3%)
 over the base model respectively. We also demonstrate the applicability of MCTF
 in various Vision Transformers (e.g. T2T-ViT LV-ViT) achieving at least 31% spe
edup without performance degradation. Code is available at https://github.com/ml
vlab/MCTF.

Towards HDR and HFR Video from Rolling-Mixed-Bit Spikings
Yakun Chang, Yeliduosi Xiaokaiti, Yujia Liu, Bin Fan, Zhaojun Huang, Tiejun Huan
g, Boxin Shi; Proceedings of the IEEE/CVF Conference on Computer Vision and Patt
ern Recognition (CVPR), 2024, pp. 25117-25127
The spiking cameras offer the benefits of high dynamic range (HDR) high temporal
 resolution and low data redundancy. However reconstructing HDR videos in high-s
peed conditions using single-bit spikings presents challenges due to the limited
 bit depth. Increasing the bit depth of the spikings is advantageous for boostin
g HDR performance but the readout efficiency will be decreased which is unfavora
ble for achieving a high frame rate (HFR) video. To address these challenges we
propose a readout mechanism to obtain rolling-mixed-bit (RMB) spikings which inv
olves interleaving multi-bit spikings within the single-bit spikings in a rollin
g manner thereby combining the characteristics of high bit depth and efficient r
eadout. Furthermore we introduce RMB-Net for reconstructing HDR and HFR videos.
RMB-Net comprises a cross-bit attention block for fusing mixed-bit spikings and
a cross-time attention block for achieving temporal fusion. Extensive experiment
s conducted on synthetic and real-synthetic data demonstrate the superiority of
our method. For instance pure 3-bit spikings result in 3 times of data volume wh
ereas our method achieves comparable performance with less than 2% increase in d
ata volume.

Scaling Up Video Summarization Pretraining with Large Language Models
Dawit Mureja Argaw, Seunghyun Yoon, Fabian Caba Heilbron, Hanieh Deilamsalehy, T
rung Bui, Zhaowen Wang, Franck Dernoncourt, Joon Son Chung; Proceedings of the I
EEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp.
8332-8341

Long-form video content constitutes a significant portion of internet traffic making automated video summarization an essential research problem. However existing video summarization datasets are notably limited in their size constraining the effectiveness of state-of-the-art methods for generalization. Our work aims to overcome this limitation by capitalizing on the abundance of long-form videos with dense speech-to-video alignment and the remarkable capabilities of recent large language models (LLMs) in summarizing long text. We introduce an automated and scalable pipeline for generating a large-scale video summarization dataset using LLMs as Oracle summarizers. By leveraging the generated dataset we analyze the limitations of existing approaches and propose a new video summarization model that effectively addresses them. To facilitate further research in the field our work also presents a new benchmark dataset that contains 1200 long videos each with high-quality summaries annotated by professionals. Extensive experiments clearly indicate that our proposed approach sets a new state-of-the-art in video summarization across several benchmarks.
****
Continuous Optical Zooming: A Benchmark for Arbitrary-Scale Image Super-Resolution in Real World
Huiyuan Fu, Fei Peng, Xianwei Li, Yejun Li, Xin Wang, Huadong Ma; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 3035-3044
Most current arbitrary-scale image super-resolution (SR) methods has commonly relied on simulated data generated by simple synthetic degradation models (e.g. bicubic downsampling) at continuous various scales thereby falling short in capturing the complex degradation of real-world images. This limitation hinders the visual quality of these methods when applied to real-world images. To address this issue we propose the Continuous Optical Zooming dataset (COZ) by constructing an automatic imaging system to collect images at fine-grained various focal lengths within a specific range and providing strict image pair alignment. The COZ dataset serves as a benchmark to provide real-world data for training and testing arbitrary-scale SR models. To enhance the model's robustness against real-world image degradation we propose a Local Mix Implicit network (LMI) based on the MLP-mixer architecture and meta-learning which directly learns the local texture information by simultaneously mixing features and coordinates of multiple independent points. The extensive experiments demonstrate the superior performance of the arbitrary-scale SR models trained on the COZ dataset compared to models trained on simulated data. Our LMI model exhibits the superior effectiveness compared to other models. This study is of great significance in developing more efficient algorithms and improving the performance of arbitrary-scale image SR methods in practical applications. Our dataset and codes are available at https://github.com/pf0607/COZ.
****
Sharingan: A Transformer Architecture for Multi-Person Gaze Following
Samy Tafasca, Anshul Gupta, Jean-Marc Odobez; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 2008-2017
Gaze is a powerful form of non-verbal communication that humans develop from an early age. As such modeling this behavior is an important task that can benefit a broad set of application domains ranging from robotics to sociology. In particular the gaze following task in computer vision is defined as the prediction of the 2D pixel coordinates where a person in the image is looking. Previous attempts in this area have primarily centered on CNN-based architectures but they have been constrained by the need to process one person at a time which proves to be highly inefficient. In this paper we introduce a novel and effective multi-person transformer-based architecture for gaze prediction. While there exist prior works using transformers for multi-person gaze prediction they use a fixed set of learnable embeddings to decode both the person and its gaze target which requires a matching step afterward to link the predictions with the annotations. Thus it is difficult to quantitatively evaluate these methods reliably with the available benchmarks or integrate them into a larger human behavior understanding system. Instead we are the first to propose a multi-person transformer-based archit

ecture that maintains the original task formulation and ensures control over the people fed as input. Our main contribution lies in encoding the person-specific information into a single controlled token to be processed alongside image tokens and using its output for prediction based on a novel multiscale decoding mechanism. Our new architecture achieves state-of-the-art results on the GazeFollow VideoAttentionTarget and ChildPlay datasets and outperforms comparable multi-person architectures with a notable margin. Our code checkpoints and data extractions will be made publicly available soon.

ViewFusion: Towards Multi-View Consistency via Interpolated Denoising
Xianghui Yang, Yan Zuo, Sameera Ramasinghe, Loris Bazzani, Gil Avraham, Anton van den Hengel; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 9870-9880
Novel-view synthesis through diffusion models has demonstrated remarkable potential for generating diverse and high-quality images. Yet the independent process of image generation in these prevailing methods leads to challenges in maintaining multiple-view consistency. To address this we introduce ViewFusion a novel training-free algorithm that can be seamlessly integrated into existing pre-trained diffusion models. Our approach adopts an auto-regressive method that implicitly leverages previously generated views as context for the next view generation ensuring robust multi-view consistency during the novel-view generation process. Through a diffusion process that fuses known-view information via interpolated denoising our framework successfully extends single-view conditioned models to work in multiple-view conditional settings without any additional fine-tuning. Extensive experimental results demonstrate the effectiveness of ViewFusion in generating consistent and detailed novel views.

SketchINR: A First Look into Sketches as Implicit Neural Representations
Hmrishav Bandyopadhyay, Ayan Kumar Bhunia, Pinaki Nath Chowdhury, Aneeshan Sain, Tao Xiang, Timothy Hospedales, Yi-Zhe Song; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 12565-12574
We propose SketchINR to advance the representation of vector sketches with implicit neural models. A variable length vector sketch is compressed into a latent space of fixed dimension that implicitly encodes the underlying shape as a function of time and strokes. The learned function predicts the xy point coordinates in a sketch at each time and stroke. Despite its simplicity SketchINR outperforms existing representations at multiple tasks: (i) Encoding an entire sketch dataset into a fixed size latent vector SketchINR gives 60x and 10x data compression over raster and vector sketches respectively. (ii) SketchINR's auto-decoder provides a much higher-fidelity representation than other learned vector sketch representations and is uniquely able to scale to complex vector sketches such as FS-COCO. (iii) SketchINR supports parallelisation that can decode/render 100x faster than other learned vector representations such as SketchRNN. (iv) SketchINR for the first time emulates the human ability to reproduce a sketch with varying abstraction in terms of number and complexity of strokes. As a first look at implicit sketches SketchINR's compact high-fidelity representation will support future work in modelling long and complex sketches.

Open-Vocabulary Segmentation with Semantic-Assisted Calibration
Yong Liu, Sule Bai, Guanbin Li, Yitong Wang, Yansong Tang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 3491-3500
This paper studies open-vocabulary segmentation (OVS) through calibrating in-vocabulary and domain-biased embedding space with generalized contextual prior of CLIP. As the core of open-vocabulary understanding alignment of visual content with the semantics of unbounded text has become the bottleneck of this field. To address this challenge recent works propose to utilize CLIP as an additional classifier and aggregate model predictions with CLIP classification results. Despite their remarkable progress performance of OVS methods in relevant scenarios is still unsatisfactory compared with supervised counterparts. We attribute this to

the in-vocabulary embedding and domain-biased CLIP prediction. To this end we pr esent a Semantic-assisted CAlibration Network (SCAN). In SCAN we incorporate gen eralized semantic prior of CLIP into proposal embedding to avoid collapsing on k nown categories. Besides a contextual shift strategy is applied to mitigate the lack of global context and unnatural background noise. With above designs SCAN a chieves state-of-the-art performance on all popular open-vocabulary segmentation benchmarks. Furthermore we also focus on the problem of existing evaluation sys tem that ignores semantic duplication across categories and propose a new metric called Semantic-Guided IoU (SG-IoU).
****

MatchU: Matching Unseen Objects for 6D Pose Estimation from RGB-D Images
Junwen Huang, Hao Yu, Kuan-Ting Yu, Nassir Navab, Slobodan Ilic, Benjamin Busam; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recogniti on (CVPR), 2024, pp. 10095-10105
Recent learning methods for object pose estimation require resource-intensive tr aining for each individual object instance or category hampering their scalabili ty in real applications when confronted with previously unseen objects. In this paper we propose MatchU a Fuse-Describe-Match strategy for 6D pose estimation fr om RGB-D images. MatchU is a generic approach that fuses 2D texture and 3D geome tric cues for 6D pose prediction of unseen objects. We rely on learning geometri c 3D descriptors that are rotation-invariant by design. By encoding pose-agnosti c geometry the learned descriptors naturally generalize to unseen objects and ca pture symmetries. To tackle ambiguous associations using 3D geometry only we fus e additional RGB information into our descriptor. This is achieved through a nov el attention-based mechanism that fuses cross-modal information together with a matching loss that leverages the latent space learned from RGB data to guide the descriptor learning process. Extensive experiments reveal the generalizability of both the RGB-D fusion strategy as well as the descriptor efficacy. Benefiting from the novel designs MatchU surpasses all existing methods by a significant m argin in terms of both accuracy and speed even without the requirement of expens ive re-training or rendering.

Towards a Perceptual Evaluation Framework for Lighting Estimation
Justine Giroux, Mohammad Reza Karimi Dastjerdi, Yannick Hold-Geoffroy, Javier Va zquez-Corral, Jean-François Lalonde; Proceedings of the IEEE/CVF Conference on C omputer Vision and Pattern Recognition (CVPR), 2024, pp. 4410-4419
Progress in lighting estimation is tracked by computing existing image quality a ssessment (IQA) metrics on images from standard datasets. While this may appear to be a reasonable approach we demonstrate that doing so does not correlate to h uman preference when the estimated lighting is used to relight a virtual scene i nto a real photograph. To study this we design a controlled psychophysical exper iment where human observers must choose their preference amongst rendered scenes lit using a set of lighting estimation algorithms selected from the recent lite rature and use it to analyse how these algorithms perform according to human per ception. Then we demonstrate that none of the most popular IQA metrics from the literature taken individually correctly represent human perception. Finally we s how that by learning a combination of existing IQA metrics we can more accuratel y represent human preference. This provides a new perceptual framework to help e valuate future lighting estimation algorithms. To encourage future research all (anonymised) perceptual data and code are available at https://lvsn.github.io/Pe rceptionMetric/.

Bridging the Synthetic-to-Authentic Gap: Distortion-Guided Unsupervised Domain A daptation for Blind Image Quality Assessment
Aobo Li, Jinjian Wu, Yongxu Liu, Leida Li; Proceedings of the IEEE/CVF Conferenc e on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 28422-28431
The annotation of blind image quality assessment (BIQA) is labor-intensive and t ime-consuming especially for authentic images. Training on synthetic data is exp ected to be beneficial but synthetically trained models often suffer from poor g eneralization in real domains due to domain gaps. In this work we make a key obs

ervation that introducing more distortion types in the synthetic dataset may not improve or even be harmful to generalizing authentic image quality assessment. To solve this challenge we propose distortion-guided unsupervised domain adaptation for BIQA (DGQA) a novel framework that leverages adaptive multi-domain selection via prior knowledge from distortion to match the data distribution between the source domains and the target domain thereby reducing negative transfer from the outlier source domains. Extensive experiments on two cross-domain settings (synthetic distortion to authentic distortion and synthetic distortion to algorithmic distortion) have demonstrated the effectiveness of our proposed DGQA. Besides DGQA is orthogonal to existing model-based BIQA methods and can be used in combination with such models to improve performance with less training data.
****
Coherent Temporal Synthesis for Incremental Action Segmentation
Guodong Ding, Hans Golong, Angela Yao; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 28485-28494
Data replay is a successful incremental learning technique for images. It prevents catastrophic forgetting by keeping a reservoir of previous data original or synthesized to ensure the model retains past knowledge while adapting to novel concepts. However its application in the video domain is rudimentary as it simply stores frame exemplars for action recognition. This paper presents the first exploration of video data replay techniques for incremental action segmentation focusing on action temporal modeling. We propose a Temporally Coherent Action (TCA) model which represents actions using a generative model instead of storing individual frames. The integration of a conditioning variable that captures temporal coherence allows our model to understand the evolution of action features over time. Therefore action segments generated by TCA for replay are diverse and temporally coherent. In a 10-task incremental setup on the Breakfast dataset our approach achieves significant increases in accuracy for up to 22% compared to the baselines.

HiFi4G: High-Fidelity Human Performance Rendering via Compact Gaussian Splatting
Yuheng Jiang, Zhehao Shen, Penghao Wang, Zhuo Su, Yu Hong, Yingliang Zhang, Jingyi Yu, Lan Xu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 19734-19745
We have recently seen tremendous progress in photo-real human modeling and rendering. Yet efficiently rendering realistic human performance and integrating it into the rasterization pipeline remains challenging. In this paper we present HiFi4G an explicit and compact Gaussian-based approach for high-fidelity human performance rendering from dense footage. Our core intuition is to marry the 3D Gaussian representation with non-rigid tracking achieving a compact and compression-friendly representation. We first propose a dual-graph mechanism to obtain motion priors with a coarse deformation graph for effective initialization and a fine-grained Gaussian graph to enforce subsequent constraints. Then we utilize a 4D Gaussian optimization scheme with adaptive spatial-temporal regularizers to effectively balance the non-rigid prior and Gaussian updating. We also present a companion compression scheme with residual compensation for immersive experiences on various platforms. It achieves a substantial compression rate of approximately 25 times with less than 2MB of storage per frame. Extensive experiments demonstrate the effectiveness of our approach which significantly outperforms existing approaches in terms of optimization speed rendering quality and storage overhead.
****
G-FARS: Gradient-Field-based Auto-Regressive Sampling for 3D Part Grouping
Junfeng Cheng, Tania Stathaki; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 27652-27661
This paper proposes a novel task named "3D part grouping". Suppose there is a mixed set containing scattered parts from various shapes. This task requires algorithms to find out every possible combination among all the parts. To address this challenge we propose the so called Gradient Field-based Auto-Regressive Sampling framework (G-FARS) tailored specifically for the 3D part grouping task. In ou

r framework we design a gradient-field-based selection graph neural network (GNN) to learn the gradients of a log conditional probability density in terms of part selection where the condition is the given mixed part set. This innovative approach implemented through the gradient-field-based selection GNN effectively captures complex relationships among all the parts in the input. Upon completion of the training process our framework becomes capable of autonomously grouping 3D parts by iteratively selecting them from the mixed part set leveraging the knowledge acquired by the trained gradient-field-based selection GNN. Our code is available at: https://github.com/J-F-Cheng/G-FARS-3DPartGrouping.
****
Towards High-fidelity Artistic Image Vectorization via Texture-Encapsulated Shape Parameterization
Ye Chen, Bingbing Ni, Jinfan Liu, Xiaoyang Huang, Xuanhong Chen; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 15877-15886
We develop a novel vectorized image representation scheme accommodating both shape/geometry and texture in a decoupled way particularly tailored for reconstruction and editing tasks of artistic/design images such as Emojis and Cliparts. In the heart of this representation is a set of sparsely and unevenly located 2D control points. On one hand these points constitute a collection of parametric/vectorized geometric primitives (e.g. curves and closed shapes) describing the shape characteristics of the target image. On the other hand local texture codes in terms of implicit neural network parameters are spatially distributed into each control point yielding local coordinate-to-RGB mappings within the anchored region of each control point. In the meantime a zero-shot learning algorithm is developed to decompose an arbitrary raster image into the above representation for the sake of high-fidelity image vectorization with convenient editing ability. Extensive experiments on a series of image vectorization and editing tasks well demonstrate the high accuracy offered by our proposed method with a significantly higher image compression ratio over prior art.
****
On Exact Inversion of DPM-Solvers
Seongmin Hong, Kyeonghyun Lee, Suh Yoon Jeon, Hyewon Bae, Se Young Chun; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 7069-7078
Diffusion probabilistic models (DPMs) are a key component in modern generative models. DPM-solvers have achieved reduced latency and enhanced quality significantly but have posed challenges to find the exact inverse (i.e. finding the initial noise from the given image). Here we investigate the exact inversions for DPM-solvers and propose algorithms to perform them when samples are generated by the first-order as well as higher-order DPM-solvers. For each explicit denoising step in DPM-solvers we formulated the inversions using implicit methods such as gradient descent or forward step method to ensure the robustness to large classifier-free guidance unlike the prior approach using fixed-point iteration. Experimental results demonstrated that our proposed exact inversion methods significantly reduced the error of both image and noise reconstructions greatly enhanced the ability to distinguish invisible watermarks and well prevented unintended background changes consistently during image editing.

EfficientSAM: Leveraged Masked Image Pretraining for Efficient Segment Anything
Yunyang Xiong, Bala Varadarajan, Lemeng Wu, Xiaoyu Xiang, Fanyi Xiao, Chenchen Zhu, Xiaoliang Dai, Dilin Wang, Fei Sun, Forrest Iandola, Raghuraman Krishnamoorthi, Vikas Chandra; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 16111-16121
Segment Anything Model (SAM) has emerged as a powerful tool for numerous vision applications. A key component that drives the impressive performance for zero-shot transfer and high versatility is a super large Transformer model trained on the extensive high-quality SA-1B dataset. While beneficial the huge computation cost of SAM model has limited its applications to wider real-world applications. To address this limitation we propose EfficientSAMs light-weight SAM models that

exhibits decent performance with largely reduced complexity. Our idea is based on leveraging masked image pretraining SAMI which learns to reconstruct features from SAM image encoder for effective visual representation learning. Further we take SAMI-pretrained light-weight image encoders and mask decoder to build EfficientSAMs and finetune the models on SA-1B for segment anything task. We perform evaluations on multiple vision tasks including image classification object detection instance segmentation and semantic segmentation and find that our proposed pretraining method SAMI consistently outperforms other masked image pretraining methods. On segment anything task such as zero-shot instance segmentation our EfficientSAMs with SAMI-pretrained lightweight image encoders perform favorably with a significant gain (e.g. 4 AP on COCO/LVIS) over other fast SAM models. Our EfficientSAM code and models are available at https://github.com/yformer/EfficientSAM.
****
ChatScene: Knowledge-Enabled Safety-Critical Scenario Generation for Autonomous Vehicles
Jiawei Zhang, Chejian Xu, Bo Li; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 15459-15469
We present ChatScene a Large Language Model (LLM)-based agent that leverages the capabilities of LLMs to generate safety-critical scenarios for autonomous vehicles. Given unstructured language instructions the agent first generates textually described traffic scenarios using LLMs. These scenario descriptions are subsequently broken down into several sub-descriptions for specified details such as behaviors and locations of vehicles. The agent then distinctively transforms the textually described sub-scenarios into domain-specific languages which then generate actual code for prediction and control in simulators facilitating the creation of diverse and complex scenarios within the CARLA simulation environment. A key part of our agent is a comprehensive knowledge retrieval component which efficiently translates specific textual descriptions into corresponding domain-specific code snippets by training a knowledge database containing the scenario description and code pairs. Extensive experimental results underscore the efficacy of ChatScene in improving the safety of autonomous vehicles. For instance the scenarios generated by ChatScene show a 15% increase in collision rates compared to state-of-the-art baselines when tested against different reinforcement learning-based ego vehicles. Furthermore we show that by using our generated safety-critical scenarios to fine-tune different RL-based autonomous driving models they can achieve a 9% reduction in collision rates surpassing current SOTA methods. ChatScene effectively bridges the gap between textual descriptions of traffic scenarios and practical CARLA simulations providing a unified way to conveniently generate safety-critical scenarios for safety testing and improvement for AVs.

CAMEL: CAusal Motion Enhancement Tailored for Lifting Text-driven Video Editing
Guiwei Zhang, Tianyu Zhang, Guanglin Niu, Zichang Tan, Yalong Bai, Qing Yang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 9079-9088
Text-driven video editing poses significant challenges in exhibiting flicker-free visual continuity while preserving the inherent motion patterns of original videos. Existing methods operate under a paradigm where motion and appearance are intricately intertwined. This coupling leads to the network either over-fitting appearance content -- failing to capture motion patterns -- or focusing on motion patterns at the expense of content generalization to diverse textual scenarios. Inspired by the pivotal role of wavelet transform in dissecting video sequences we propose CAusal Motion Enhancement tailored for Lifting text-driven video editing (CAMEL) a novel technique with two core designs. First we introduce motion prompts designed to summarize motion concepts from video templates through direct optimization. The optimized prompts are purposefully integrated into latent representations of diffusion models to enhance the motion fidelity of generated results. Second to enhance motion coherence and extend the generalization of appearance content to creative textual prompts we propose the causal motion-enhanced attention mechanism. This mechanism is implemented in tandem with a novel causa

l motion filter synergistically enhancing the motion coherence of disentangled high-frequency components and concurrently preserving the generalization of appearance content across various textual scenarios. Extensive experimental results show the superior performance of CAMEL.

Teeth-SEG: An Efficient Instance Segmentation Framework for Orthodontic Treatment based on Multi-Scale Aggregation and Anthropic Prior Knowledge
Bo Zou, Shaofeng Wang, Hao Liu, Gaoyue Sun, Yajie Wang, FeiFei Zuo, Chengbin Quan, Youjian Zhao; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 11601-11610
Teeth localization segmentation and labeling in 2D images have great potential in modern dentistry to enhance dental diagnostics treatment planning and population-based studies on oral health. However general instance segmentation frameworks are incompetent due to 1) the subtle differences between some teeth' shapes (e.g. maxillary first premolar and second premolar) 2) the teeth's position and shape variation across subjects and 3) the presence of abnormalities in the dentition (e.g. caries and edentulism). To address these problems we propose a ViT-based framework named TeethSEG which consists of stacked Multi-Scale Aggregation (MSA) blocks and an Anthropic Prior Knowledge (APK) layer. Specifically to compose the two modules we design 1) a unique permutation-based upscaler to ensure high efficiency while establishing clear segmentation boundaries with 2) multi-head self/cross-gating layers to emphasize particular semantics meanwhile maintaining the divergence between token embeddings. Besides we collect 3) the first open-sourced intraoral image dataset IO150K which comprises over 150k intraoral photos and all photos are annotated by orthodontists using a human-machine hybrid algorithm. Experiments on IO150K demonstrate that our TeethSEG outperforms the state-of-the-art segmentation models on dental image segmentation.

FocSAM: Delving Deeply into Focused Objects in Segmenting Anything
You Huang, Zongyu Lan, Liujuan Cao, Xianming Lin, Shengchuan Zhang, Guannan Jiang, Rongrong Ji; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 3120-3130
The Segment Anything Model (SAM) marks a notable milestone in segmentation models highlighted by its robust zero-shot capabilities and ability to handle diverse prompts. SAM follows a pipeline that separates interactive segmentation into image preprocessing through a large encoder and interactive inference via a lightweight decoder ensuring efficient real-time performance. However SAM faces stability issues in challenging samples upon this pipeline. These issues arise from two main factors. Firstly the image preprocessing disables SAM to dynamically use image-level zoom-in strategies to refocus on the target object during interaction. Secondly the lightweight decoder struggles to sufficiently integrate interactive information with image embeddings. To address these two limitations we propose FocSAM with a pipeline redesigned on two pivotal aspects. First we propose Dynamic Window Multi-head Self-Attention (Dwin-MSA) to dynamically refocus SAM's image embeddings on the target object. Dwin-MSA localizes attention computations around the target object enhancing object-related embeddings with minimal computational overhead. Second we propose Pixel-wise Dynamic ReLU (P-DyReLU) to enable sufficient integration of interactive information from a few initial clicks that have significant impacts on the overall segmentation results. Experimentally FocSAM augments SAM's interactive segmentation performance to match the existing state-of-the-art method in segmentation quality requiring only about 5.6% of this method's inference time on CPUs. Code is available at https://github.com/YouHuang67/focsam.

DMR: Decomposed Multi-Modality Representations for Frames and Events Fusion in Visual Reinforcement Learning
Haoran Xu, Peixi Peng, Guang Tan, Yuan Li, Xinhai Xu, Yonghong Tian; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 26508-26518
We explore visual reinforcement learning (RL) using two complementary visual mod

alities: frame-based RGB camera and event-based Dynamic Vision Sensor (DVS). Existing multi-modality visual RL methods often encounter challenges in effectively extracting task-relevant information from multiple modalities while suppressing the increased noise only using indirect reward signals instead of pixel-level supervision. To tackle this we propose a Decomposed Multi-Modality Representation (DMR) framework for visual RL. It explicitly decomposes the inputs into three distinct components: combined task-relevant features (co-features) RGB-specific noise and DVS-specific noise. The co-features represent the full information from both modalities that is relevant to the RL task; the two noise components each constrained by a data reconstruction loss to avoid information leak are contrasted with the co-features to maximize their difference. Extensive experiments demonstrate that by explicitly separating the different types of information our approach achieves substantially improved policy performance compared to state-of-the-art approaches.

DiffuseMix: Label-Preserving Data Augmentation with Diffusion Models
Khawar Islam, Muhammad Zaigham Zaheer, Arif Mahmood, Karthik Nandakumar; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 27621-27630
Recently a number of image-mixing-based augmentation techniques have been introduced to improve the generalization of deep neural networks. In these techniques two or more randomly selected natural images are mixed together to generate an augmented image. Such methods may not only omit important portions of the input images but also introduce label ambiguities by mixing images across labels resulting in misleading supervisory signals. To address these limitations we propose DIFFUSEMIX a novel data augmentation technique that leverages a diffusion model to reshape training images supervised by our bespoke conditional prompts. First concatenation of a partial natural image and its generated counterpart is obtained which helps in avoiding the generation of unrealistic images or label ambiguities. Then to enhance resilience against adversarial attacks and improves safety measures a randomly selected structural pattern from a set of fractal images is blended into the concatenated image to form the final augmented image for training. Our empirical results on seven different datasets reveal that DIFFUSEMIX achieves superior performance compared to existing state- of-the-art methods on tasks including general classification fine-grained classification fine-tuning data scarcity and adversarial robustness.
****
PRDP: Proximal Reward Difference Prediction for Large-Scale Reward Finetuning of Diffusion Models
Fei Deng, Qifei Wang, Wei Wei, Tingbo Hou, Matthias Grundmann; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 7423-7433
Reward finetuning has emerged as a promising approach to aligning foundation models with downstream objectives. Remarkable success has been achieved in the language domain by using reinforcement learning (RL) to maximize rewards that reflect human preference. However in the vision domain existing RL-based reward finetuning methods are limited by their instability in large-scale training rendering them incapable of generalizing to complex unseen prompts. In this paper we propose Proximal Reward Difference Prediction (PRDP) enabling stable black-box reward finetuning for diffusion models for the first time on large-scale prompt datasets with over 100K prompts. Our key innovation is the Reward Difference Prediction (RDP) objective that has the same optimal solution as the RL objective while enjoying better training stability. Specifically the RDP objective is a supervised regression objective that tasks the diffusion model with predicting the reward difference of generated image pairs from their denoising trajectories. We theoretically prove that the diffusion model that obtains perfect reward difference prediction is exactly the maximizer of the RL objective. We further develop an online algorithm with proximal updates to stably optimize the RDP objective. In experiments we demonstrate that PRDP can match the reward maximization ability of well-established RL-based methods in small-scale training. Furthermore through l

arge-scale training on text prompts from the Human Preference Dataset v2 and the Pick-a-Pic v1 dataset PRDP achieves superior generation quality on a diverse set of complex unseen prompts whereas RL-based methods completely fail.
****

FREE: Faster and Better Data-Free Meta-Learning

Yongxian Wei, Zixuan Hu, Zhenyi Wang, Li Shen, Chun Yuan, Dacheng Tao; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 23273-23282

Data-Free Meta-Learning (DFML) aims to extract knowledge from a collection of pre-trained models without requiring the original data presenting practical benefits in contexts constrained by data privacy concerns. Current DFML methods primarily focus on the data recovery from these pre-trained models. However they suffer from slow recovery speed and overlook gaps inherent in heterogeneous pre-trained models. In response to these challenges we introduce the Faster and Better Data-Free Meta-Learning (FREE) framework which contains: (i) a meta-generator for rapidly recovering training tasks from pre-trained models; and (ii) a meta-learner for generalizing to new unseen tasks. Specifically within the module Faster Inversion via Meta-Generator each pre-trained model is perceived as a distinct task. The meta-generator can rapidly adapt to a specific task in just five steps significantly accelerating the data recovery. Furthermore we propose Better Generalization via Meta-Learner and introduce an implicit gradient alignment algorithm to optimize the meta-learner. This is achieved as aligned gradient directions alleviate potential conflicts among tasks from heterogeneous pre-trained models. Empirical experiments on multiple benchmarks affirm the superiority of our approach marking a notable speed-up (20x) and performance enhancement (1.42%   4.78%) in comparison to the state-of-the-art.

Bayesian Diffusion Models for 3D Shape Reconstruction

Haiyang Xu, Yu Lei, Zeyuan Chen, Xiang Zhang, Yue Zhao, Yilin Wang, Zhuowen Tu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 10628-10638

We present Bayesian Diffusion Models (BDM) a prediction algorithm that performs effective Bayesian inference by tightly coupling the top-down (prior) information with the bottom-up (data-driven) procedure via joint diffusion processes. We demonstrate the application of BDM on the 3D shape reconstruction task. Compared to standard deep learning data-driven approaches relying on supervised data our BDM can bring in rich prior information trained in an unsupervised manner to improve the bottom-up 3D reconstruction. As opposed to the traditional Bayesian frameworks where explicitly learned prior and data-driven distributions are required for gradient computation and combination BDM performs a seamless fusion of the two via coupled diffusion processes with learned gradient computation networks. The specialty of our Bayesian Diffusion Models (BDM) lies in its capability to engage the active and effective information exchange and fusion of the top-down and bottom-up processes where each itself is a diffusion process. We demonstrate state-of-the-art results on both synthetic and real-world benchmarks for 3D shape reconstruction. Project link: https://mlpc-ucsd.github.io/BDM

Task-Customized Mixture of Adapters for General Image Fusion

Pengfei Zhu, Yang Sun, Bing Cao, Qinghua Hu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 7099-7108

General image fusion aims at integrating important information from multi-source images. However due to the significant cross-task gap the respective fusion mechanism varies considerably in practice resulting in limited performance across subtasks. To handle this problem we propose a novel task-customized mixture of adapters (TC-MoA) for general image fusion adaptively prompting various fusion tasks in a unified model. We borrow the insight from the mixture of experts (MoE) taking the experts as efficient tuning adapters to prompt a pre-trained foundation model. These adapters are shared across different tasks and constrained by mutual information regularization ensuring compatibility with different tasks while complementarity for multi-source images. The task-specific routing networks cus

tomize these adapters to extract task-specific information from different source
s with dynamic dominant intensity performing adaptive visual feature prompt fusi
on. Notably our TC-MoA controls the dominant intensity bias for different fusion
 tasks successfully unifying multiple fusion tasks in a single model. Extensive
experiments show that TC-MoA outperforms the competing approaches in learning co
mmonalities while retaining compatibility for general image fusion (multi-modal
multi-exposure and multi-focus) and also demonstrating striking controllability
on more generalization experiments. The code is available at https://github.com/
YangSun22/TC-MoA.

Bi-SSC: Geometric-Semantic Bidirectional Fusion for Camera-based 3D Semantic Sce
ne Completion
Yujie Xue, Ruihui Li, Fan Wu, Zhuo Tang, Kenli Li, Mingxing Duan; Proceedings of
 the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024
, pp. 20124-20134
Camera-based Semantic Scene Completion (SSC) is to infer the full geometry of ob
jects and scenes from only 2D images. The task is particularly challenging for t
hose invisible areas due to the inherent occlusions and lighting ambiguity. Exis
ting works ignore the information missing or ambiguous in those shaded and occlu
ded areas resulting in distorted geometric prediction. To address this issue we
propose a novel method Bi-SSC bidirectional geometric semantic fusion for camera
-based 3D semantic scene completion. The key insight is to use the neighboring s
tructure of objects in the image and the spatial differences from different pers
pectives to compensate for the lack of information in occluded areas. Specifical
ly we introduce a spatial sensory fusion module with multiple association attent
ion to improve semantic correlation in geometric distributions. This module work
s within single view and across stereo views to achieve global spatial consisten
cy. Experimental results demonstrate that Bi-SSC outperforms state-of-the-art ca
mera-based methods on SemanticKITTI particularly excelling in those invisible an
d shaded areas.

CrossKD: Cross-Head Knowledge Distillation for Object Detection
Jiabao Wang, Yuming Chen, Zhaohui Zheng, Xiang Li, Ming-Ming Cheng, Qibin Hou; P
roceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition
 (CVPR), 2024, pp. 16520-16530
Knowledge Distillation (KD) has been validated as an effective model compression
 technique for learning compact object detectors. Existing state-of-the-art KD m
ethods for object detection are mostly based on feature imitation. In this paper
 we present a general and effective prediction mimicking distillation scheme cal
led CrossKD which delivers the intermediate features of the student's detection
head to the teacher's detection head. The resulting cross-head predictions are t
hen forced to mimic the teacher's predictions. This manner relieves the student'
s head from receiving contradictory supervision signals from the annotations and
 the teacher's predictions greatly improving the student's detection performance
. Moreover as mimicking the teacher's predictions is the target of KD CrossKD of
fers more task-oriented information in contrast with feature imitation. On MS CO
CO with only prediction mimicking losses applied our CrossKD boosts the average
precision of GFL ResNet-50 with 1x training schedule from 40.2 to 43.7 outperfor
ming all existing KD methods. In addition our method also works well when distil
ling detectors with heterogeneous backbones.

Bi-level Learning of Task-Specific Decoders for Joint Registration and One-Shot
Medical Image Segmentation
Xin Fan, Xiaolin Wang, Jiaxin Gao, Jia Wang, Zhongxuan Luo, Risheng Liu; Proceed
ings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR
), 2024, pp. 11726-11735
One-shot medical image segmentation (MIS) aims to cope with the expensive time-c
onsuming and inherent human bias annotations. One prevalent method to address on
e-shot MIS is joint registration and segmentation (JRS) with a shared encoder wh
ich mainly explores the voxel-wise correspondence between the labeled data and u

nlabeled data for better segmentation. However this method omits underlying conn ections between task-specific decoders for segmentation and registration leading to unstable training. In this paper we propose a novel Bi-level Learning of Tas k-Specific Decoders for one-shot MIS employing a pretrained fixed shared encoder that is proved to be more quickly adapted to brand-new datasets than existing J RS without fixed shared encoder paradigm. To be more specific we introduce a bi-level optimization training strategy considering registration as a major objecti ve and segmentation as a learnable constraint by leveraging inter-task coupling dependencies. Furthermore we design an appearance conformity constraint strategy that learns the backward transformations generating the fake labeled data used to perform data augmentation instead of the labeled image to avoid performance d egradation caused by inconsistent styles between unlabeled data and labeled data in previous methods. Extensive experiments on the brain MRI task across ABIDE A DNI and PPMI datasets demonstrate that the proposed Bi-JROS outperforms state-of -the-art one-shot MIS methods for both segmentation and registration tasks. The code will be available at https://github.com/Coradlut/Bi-JROS.

Parameter Efficient Self-Supervised Geospatial Domain Adaptation
Linus Scheibenreif, Michael Mommert, Damian Borth; Proceedings of the IEEE/CVF C onference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 27841-278 51
As large-scale foundation models become publicly available for different domains efficiently adapting them to individual downstream applications and additional data modalities has turned into a central challenge. For example foundation mode ls for geospatial and satellite remote sensing applications are commonly trained on large optical RGB or multi-spectral datasets although data from a wide varie ty of heterogeneous sensors are available in the remote sensing domain. This lea ds to significant discrepancies between pre-training and downstream target data distributions for many important applications. Fine-tuning large foundation mode ls to bridge that gap incurs high computational cost and can be infeasible when target datasets are small. In this paper we address the question of how large pr e-trained foundational transformer models can be efficiently adapted to downstre am remote sensing tasks involving different data modalities or limited dataset s ize. We present a self-supervised adaptation method that boosts downstream linea r evaluation accuracy of different foundation models by 4-6% (absolute) across 8 remote sensing datasets while outperforming full fine-tuning when training only 1-2% of the model parameters. Our method significantly improves label efficienc y and increases few-shot accuracy by 6-10% on different datasets.

Defense without Forgetting: Continual Adversarial Defense with Anisotropic & Iso tropic Pseudo Replay
Yuhang Zhou, Zhongyun Hua; Proceedings of the IEEE/CVF Conference on Computer Vi sion and Pattern Recognition (CVPR), 2024, pp. 24263-24272
Deep neural networks have demonstrated susceptibility to adversarial attacks. Ad versarial defense techniques often focus on one-shot setting to maintain robustn ess against attack. However new attacks can emerge in sequences in real-world de ployment scenarios. As a result it is crucial for a defense model to constantly adapt to new attacks but the adaptation process can lead to catastrophic forgett ing of previously defended against attacks. In this paper we discuss for the fir st time the concept of continual adversarial defense under a sequence of attacks and propose a lifelong defense baseline called Anisotropic & Isotropic Replay (AIR) which offers three advantages: (1) Isotropic replay ensures model consisten cy in the neighborhood distribution of new data indirectly aligning the output p reference between old and new tasks. (2) Anisotropic replay enables the model to learn a compromise data manifold with fresh mixed semantics for further replay constraints and potential future attacks. (3) A straightforward regularizer miti gates the 'plasticity-stability' trade-off by aligning model output between new and old tasks. Experiment results demonstrate that AIR can approximate or even e xceed the empirical performance upper bounds achieved by Joint Training.

EscherNet: A Generative Model for Scalable View Synthesis
Xin Kong, Shikun Liu, Xiaoyang Lyu, Marwan Taher, Xiaojuan Qi, Andrew J. Davison; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 9503-9513
We introduce EscherNet a multi-view conditioned diffusion model for view synthesis. EscherNet learns implicit and generative 3D representations coupled with a specialised camera positional encoding allowing precise and continuous relative control of the camera transformation between an arbitrary number of reference and target views. EscherNet offers exceptional generality flexibility and scalability in view synthesis --- it can generate more than 100 consistent target views simultaneously on a single consumer-grade GPU despite being trained with a fixed number of 3 reference views to 3 target views. As a result EscherNet not only addresses zero-shot novel view synthesis but also naturally unifies single- and multi-image 3D reconstruction combining these diverse tasks into a single cohesive framework. Our extensive experiments demonstrate that EscherNet achieves state-of-the-art performance in multiple benchmarks even when compared to methods specifically tailored for each individual problem. This remarkable versatility opens up new directions for designing scalable neural architectures for 3D vision. Project page: https://kxhit.github.io/EscherNet.
****
MeaCap: Memory-Augmented Zero-shot Image Captioning
Zequn Zeng, Yan Xie, Hao Zhang, Chiyu Chen, Bo Chen, Zhengjue Wang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 14100-14110
Zero-shot image captioning (IC) without well-paired image-text data can be categorized into two main types: training-free and text-only-training methods. While both types integrate pre-trained vision-language models such as CLIP for image-text similarity evaluation and a pre-trained language model (LM) for caption generation their distinction lies in the utilization of textual corpus for LM training. Despite achieving promising performance on certain metrics existing methods commonly suffer from drawbacks. Training-free methods often generate hallucinations whereas text-only-training methods may lack generalization capability. To address these challenges we propose a novel Memory-Augmented zero-shot image Captioning framework (MeaCap). This framework equipped with a textual memory incorporates a retrieve-then-filter module to extract key concepts highly relevant to the image. By leveraging our proposed memory-augmented visual-related fusion score within a keywords-to-sentence LM MeaCap generates concept-centered captions that exhibit high consistency with the image with reduced hallucinations and enriched world knowledge. MeaCap achieves state-of-the-art performance across various zero-shot IC settings. Our code is publicly available at https://github.com/joeyz0z/MeaCap.
****
Artist-Friendly Relightable and Animatable Neural Heads
Yingyan Xu, Prashanth Chandran, Sebastian Weiss, Markus Gross, Gaspard Zoss, Derek Bradley; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 2457-2467
An increasingly common approach for creating photo-realistic digital avatars is through the use of volumetric neural fields. The original neural radiance field (NeRF) allowed for impressive novel view synthesis of static heads when trained on a set of multi-view images and follow up methods showed that these neural representations can be extended to dynamic avatars. Recently new variants also surpassed the usual drawback of baked-in illumination in neural representations showing that static neural avatars can be relit in any environment. In this work we simultaneously tackle both the motion and illumination problem proposing a new method for relightable and animatable neural heads. Our method builds on a proven dynamic avatar approach based on a mixture of volumetric primitives combined with a recently-proposed lightweight hardware setup for relightable neural fields and includes a novel architecture that allows relighting dynamic neural avatars performing unseen expressions in any environment even with nearfield illumination and viewpoints.

****
Elite360D: Towards Efficient 360 Depth Estimation via Semantic- and Distance-Awa re Bi-Projection Fusion
Hao Ai, Lin Wang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 9926-9935
360 depth estimation has recently received great attention for 3D reconstruction owing to its omnidirectional field of view (FoV). Recent approaches are predomi nantly focused on cross-projection fusion with geometry-based re-projection: the y fuse 360 images with equirectangular projection (ERP) and another projection t ype e.g. cubemap projection to estimate depth with the ERP format. However these methods suffer from 1) limited local receptive fields making it hardly possible to capture large FoV scenes and 2) prohibitive computational cost caused by the complex cross-projection fusion module design. In this paper we propose Elite36 0D a novel framework that inputs the ERP image and icosahedron projection (ICOSA P) point set which is undistorted and spatially continuous. Elite360D is superio r in its capacity in learning a representation from a local-with-global perspect ive. With a flexible ERP image encoder it includes an ICOSAP point encoder and a Bi-projection Bi-attention Fusion (B2F) module (totally 1M parameters). Specif ically the ERP image encoder can take various perspective image-trained backbone s (e.g. ResNet Transformer) to extract local features. The point encoder extract s the global features from the ICOSAP. Then the B2F module captures the semantic - and distance-aware dependencies between each pixel of the ERP feature and the entire ICOSAP feature set. Without specific backbone design and obvious computat ional cost increase Elite360D outperforms the prior arts on several benchmark da tasets.

From Feature to Gaze: A Generalizable Replacement of Linear Layer for Gaze Estim ation
Yiwei Bao, Feng Lu; Proceedings of the IEEE/CVF Conference on Computer Vision an d Pattern Recognition (CVPR), 2024, pp. 1409-1418
Deep-learning-based gaze estimation approaches often suffer from notable perform ance degradation in unseen target domains. One of the primary reasons is that th e Fully Connected layer is highly prone to overfitting when mapping the high-dim ensional image feature to 3D gaze. In this paper we propose Analytical Gaze Gene ralization framework (AGG) to improve the generalization ability of gaze estimat ion models without touching target domain data. The AGG consists of two modules the Geodesic Projection Module (GPM) and the Sphere-Oriented Training (SOT). GPM is a generalizable replacement of FC layer which projects high-dimensional imag e features to 3D space analytically to extract the principle components of gaze. Then we propose Sphere-Oriented Training (SOT) to incorporate the GPM into the training process and further improve cross-domain performances. Experimental res ults demonstrate that the AGG effectively alleviate the overfitting problem and consistently improves the cross-domain gaze estimation accuracy in 12 cross-doma in settings without requiring any target domain data. The insight from the Analy tical Gaze Generalization framework has the potential to benefit other regressio n tasks with physical meanings.

Curriculum Point Prompting for Weakly-Supervised Referring Image Segmentation
Qiyuan Dai, Sibei Yang; Proceedings of the IEEE/CVF Conference on Computer Visio n and Pattern Recognition (CVPR), 2024, pp. 13711-13722
Referring image segmentation (RIS) aims to precisely segment referents in images through corresponding natural language expressions yet relying on cost-intensiv e mask annotations. Weakly supervised RIS thus learns from image-text pairs to p ixel-level semantics which is challenging for segmenting fine-grained masks. A n atural approach to enhancing segmentation precision is to empower weakly supervi sed RIS with the image segmentation foundation model SAM. Nevertheless we observ e that simply integrating SAM yields limited benefits and can even lead to perfo rmance regression due to the inevitable noise issues and challenges in excessive focus on object parts. In this paper we present an innovative framework Point P rompTing (PPT) incorporated with the proposed multi-source curriculum learning s

trategy to address these challenges. Specifically the core of PPT is a point generator that not only harnesses CLIP's text-image alignment capability and SAM's powerful mask generation ability but also generates negative point prompts to address the noisy and excessive focus issues inherently and effectively. In addition we introduce a curriculum learning strategy with object-centric images to help PPT gradually learn from simpler yet precise semantic alignment to more complex RIS. Experiments demonstrate that our PPT significantly and consistently outperforms prior weakly supervised techniques on mIoU by 11.34% 14.14% and 6.97% across RefCOCO RefCOCO+ and G-Ref respectively.

EventDance: Unsupervised Source-free Cross-modal Adaptation for Event-based Object Recognition
Xu Zheng, Lin Wang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 17448-17458
In this paper we make the first attempt at achieving the cross-modal (i.e. image-to-events) adaptation for event-based object recognition without accessing any labeled source image data owning to privacy and commercial issues. Tackling this novel problem is non-trivial due to the novelty of event cameras and the distinct modality gap between images and events. In particular as only the source model is available a hurdle is how to extract the knowledge from the source model by only using the unlabeled target event data while achieving knowledge transfer. To this end we propose a novel framework dubbed EventDance for this unsupervised source-free cross-modal adaptation problem. Importantly inspired by event-to-video reconstruction methods we propose a reconstruction-based modality bridging (RMB) module which reconstructs intensity frames from events in a self-supervised manner. This makes it possible to build up the surrogate images to extract the knowledge (i.e. labels) from the source model. We then propose a multi-representation knowledge adaptation (MKA) module that transfers the knowledge to target models learning events with multiple representation types for fully exploring the spatiotemporal information of events. The two modules connecting the source and target models are mutually updated so as to achieve the best performance. Experiments on three benchmark datasets with two adaption settings show that EventDance is on par with prior methods utilizing the source data.

CycleINR: Cycle Implicit Neural Representation for Arbitrary-Scale Volumetric Super-Resolution of Medical Data
Wei Fang, Yuxing Tang, Heng Guo, Mingze Yuan, Tony C. W. Mok, Ke Yan, Jiawen Yao, Xin Chen, Zaiyi Liu, Le Lu, Ling Zhang, Minfeng Xu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 11631-11641
In the realm of medical 3D data such as CT and MRI images prevalent anisotropic resolution is characterized by high intra-slice but diminished inter-slice resolution. The lowered resolution between adjacent slices poses challenges hindering optimal viewing experiences and impeding the development of robust downstream analysis algorithms. Various volumetric super-resolution algorithms aim to surmount these challenges enhancing inter-slice resolution and overall 3D medical imaging quality. However existing approaches confront inherent challenges: 1) often tailored to specific upsampling factors lacking flexibility for diverse clinical scenarios; 2) newly generated slices frequently suffer from over-smoothing degrading fine details and leading to inter-slice inconsistency. In response this study presents CycleINR a novel enhanced Implicit Neural Representation model for 3D medical data volumetric super-resolution. Leveraging the continuity of the learned implicit function the CycleINR model can achieve results with arbitrary up-sampling rates eliminating the need for separate training. Additionally we enhance the grid sampling in CycleINR with a local attention mechanism and mitigate over-smoothing by integrating cycle-consistent loss. We introduce a new metric Slice-wise Noise Level Inconsistency (SNLI) to quantitatively assess inter-slice noise level inconsistency. The effectiveness of our approach is demonstrated through image quality evaluations on an in-house dataset and a downstream task analysis on the Medical Segmentation Decathlon liver tumor dataset.

Boosting Image Restoration via Priors from Pre-trained Models
Xiaogang Xu, Shu Kong, Tao Hu, Zhe Liu, Hujun Bao; Proceedings of the IEEE/CVF C
onference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 2900-2909
Pre-trained models with large-scale training data such as CLIP and Stable Diffus
ion have demonstrated remarkable performance in various high-level computer visi
on tasks such as image understanding and generation from language descriptions.
Yet their potential for low-level tasks such as image restoration remains relati
vely unexplored. In this paper we explore such models to enhance image restorati
on. As off-the-shelf features (OSF) from pre-trained models do not directly serv
e image restoration we propose to learn an additional lightweight module called
Pre-Train-Guided Refinement Module (PTG-RM) to refine restoration results of a t
arget restoration network with OSF. PTG-RM consists of two components Pre-Train-
Guided Spatial-Varying Enhancement (PTG-SVE) and Pre-Train-Guided Channel-Spatia
l Attention (PTG-CSA). PTG-SVE enables optimal short- and long-range neural oper
ations while PTG-CSA enhances spatial-channel attention for restoration-related
learning. Extensive experiments demonstrate that PTG-RM with its compact size (<
1M parameters) effectively enhances restoration performance of various models ac
ross different tasks including low-light enhancement deraining deblurring and de
noising.

VRetouchEr: Learning Cross-frame Feature Interdependence with Imperfection Flow
for Face Retouching in Videos
Wen Xue, Le Jiang, Lianxin Xie, Si Wu, Yong Xu, Hau San Wong; Proceedings of the
 IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp
. 9141-9150
Face Video Retouching is a complex task that often requires labor-intensive manu
al editing. Conventional image retouching methods perform less satisfactorily in
 terms of generalization performance and stability when applied to videos withou
t exploiting the correlation among frames. To address this issue we propose a Vi
deo Retouching transformEr to remove facial imperfections in videos which is ref
erred to as VRetouchEr. Specifically we estimate the apparent motion of imperfec
tions between two consecutive frames and the resulting displacement vectors are
used to refine the imperfection map which is synthesized from the current frame
together with the corresponding encoder features. The flow-based imperfection re
finement is critical for precise and stable retouching across frames. To leverag
e the temporal contextual information we inject the refined imperfection map int
o each transformer block for multi-frame masked attention computation such that
we can capture the interdependence between the current frame and multiple refere
nce frames. As a result the imperfection regions can be replaced with normal ski
n with high fidelity while at the same time keeping the other regions unchanged.
 Extensive experiments are performed to verify the superiority of VRetouchEr ove
r state-of-the-art image retouching methods in terms of fidelity and stability.

Transferable Structural Sparse Adversarial Attack Via Exact Group Sparsity Train
ing
Di Ming, Peng Ren, Yunlong Wang, Xin Feng; Proceedings of the IEEE/CVF Conferenc
e on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 24696-24705
Deep neural networks (DNNs) are vulnerable to highly transferable adversarial at
tacks. Especially many studies have shown that sparse attacks pose a significant
 threat to DNNs on account of their exceptional imperceptibility. Current sparse
 attack methods mostly limit only the magnitude and number of perturbations whil
e generally overlooking the location of the perturbations resulting in decreased
 performances on attack transferability. A subset of studies indicates that pert
urbations existing in the significant regions with rich classification-relevant
features are more effective. Leveraging this insight we introduce the structural
 sparsity constraint in the framework of generative models to limit the perturba
tion positions. To ensure that the perturbations are generated towards classific
ation-relevant regions we propose an exact group sparsity training method to lea
rn pixel-level and group-level sparsity. For purpose of improving the effectiven

ess of sparse training we further put forward masked quantization network and multi-stage optimization algorithm in the training process. Utilizing CNNs as surrogate models extensive experiments demonstrate that our method has higher transferability in image classification attack compared to state-of-the-art methods at approximately same sparsity levels. In cross-model ViT object detection and semantic segmentation attack tasks we also achieve a better attack success rate. Code is available at https://github.com/MisterRpeng/EGS-TSSA.

Holistic Autonomous Driving Understanding by Bird's-Eye-View Injected Multi-Modal Large Models
Xinpeng Ding, Jianhua Han, Hang Xu, Xiaodan Liang, Wei Zhang, Xiaomeng Li; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 13668-13677
The rise of multimodal large language models (MLLMs) has spurred interest in language-based driving tasks. However existing research typically focuses on limited tasks and often omits key multi-view and temporal information which is crucial for robust autonomous driving. To bridge these gaps we introduce NuInstruct a novel dataset with 91K multi-view video-QA pairs across 17 subtasks where each task demands holistic information (e.g. temporal multi-view and spatial) significantly elevating the challenge level. To obtain NuInstruct we propose a novel SQL-based method to generate instruction-response pairs automatically which is inspired by the driving logical progression of humans. We further present BEV-InMLLM an end-to-end method for efficiently deriving instruction-aware Bird's-Eye-View (BEV) features language-aligned for large language models. BEV-InMLLM integrates multi-view spatial awareness and temporal semantics to enhance MLLMs' capabilities on NuInstruct tasks. Moreover our proposed BEV injection module is a plug-and-play method for existing MLLMs. Our experiments on NuInstruct demonstrate that BEV-InMLLM significantly outperforms existing MLLMs e.g 9% improvement on various tasks. We release our NuInstruct at https://github.com/xmed-lab/NuInstruct.

Arbitrary-Scale Image Generation and Upsampling using Latent Diffusion Model and Implicit Neural Decoder
Jinseok Kim, Tae-Kyun Kim; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 9202-9211
Super-resolution (SR) and image generation are important tasks in computer vision and are widely adopted in real-world applications. Most existing methods however generate images only at fixed-scale magnification and suffer from over-smoothing and artifacts. Additionally they do not offer enough diversity of output images nor image consistency at different scales. Most relevant work applied Implicit Neural Representation (INR) to the denoising diffusion model to obtain continuous-resolution yet diverse and high-quality SR results. Since this model operates in the image space the larger the resolution of image is produced the more memory and inference time is required and it also does not maintain scale-specific consistency. We propose a novel pipeline that can super-resolve an input image or generate from a random noise a novel image at arbitrary scales. The method consists of a pretrained auto-encoder a latent diffusion model and an implicit neural decoder and their learning strategies. The proposed method adopts diffusion processes in a latent space thus efficient yet aligned with output image space decoded by MLPs at arbitrary scales. More specifically our arbitrary-scale decoder is designed by the symmetric decoder w/o up-scaling from the pretrained auto-encoder and Local Implicit Image Function (LIIF) in series. The latent diffusion process is learnt by the denoising and the alignment losses jointly. Errors in output images are backpropagated via the fixed decoder improving the quality of output images. In the extensive experiments using multiple public benchmarks on the two tasks i.e. image super-resolution and novel image generation at arbitrary scales the proposed method outperforms relevant methods in metrics of image quality diversity and scale consistency. It is significantly better than the relevant prior-art in the inference speed and memory usage.

Unsupervised Occupancy Learning from Sparse Point Cloud

Amine Ouasfi, Adnane Boukhayma; Proceedings of the IEEE/CVF Conference on Comput
er Vision and Pattern Recognition (CVPR), 2024, pp. 21729-21739
Implicit Neural Representations have gained prominence as a powerful framework f
or capturing complex data modalities encompassing a wide range from 3D shapes to
 images and audio. Within the realm of 3D shape representation Neural Signed Dis
tance Functions (SDF) have demonstrated remarkable potential in faithfully encod
ing intricate shape geometry. However learning SDFs from 3D point clouds in the
absence of ground truth supervision remains a very challenging task. In this pap
er we propose a method to infer occupancy fields instead of SDFs as they are eas
ier to learn from sparse inputs. We leverage a margin-based uncertainty measure
to differentiably sample from the decision boundary of the occupancy function an
d supervise the sampled boundary points using the input point cloud. We further
stabilise the optimization process at the early stages of the training by biasin
g the occupancy function towards minimal entropy fields while maximizing its ent
ropy at the input point cloud. Through extensive experiments and evaluations we
illustrate the efficacy of our proposed method highlighting its capacity to impr
ove implicit shape inference with respect to baselines and the state-of-the-art
using synthetic and real data.

Extreme Point Supervised Instance Segmentation
Hyeonjun Lee, Sehyun Hwang, Suha Kwak; Proceedings of the IEEE/CVF Conference on
 Computer Vision and Pattern Recognition (CVPR), 2024, pp. 17212-17222
This paper introduces a novel approach to learning instance segmentation using e
xtreme points i.e. the topmost leftmost bottommost and rightmost points of each
object. These points are readily available in the modern bounding box annotation
 process while offering strong clues for precise segmentation and thus allows to
 improve performance at the same annotation cost with box-supervised methods. Ou
r work considers extreme points as a part of the true instance mask and propagat
es them to identify potential foreground and background points which are all tog
ether used for training a pseudo label generator. Then pseudo labels given by th
e generator are in turn used for supervised learning of our final model. On thre
e public benchmarks our method significantly outperforms existing box-supervised
 methods further narrowing the gap with its fully supervised counterpart. In par
ticular our model generates high-quality masks when a target object is separated
 into multiple parts where previous box-supervised methods often fail.

3DInAction: Understanding Human Actions in 3D Point Clouds
Yizhak Ben-Shabat, Oren Shrout, Stephen Gould; Proceedings of the IEEE/CVF Confe
rence on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 19978-19987
We propose a novel method for 3D point cloud action recognition. Understanding h
uman actions in RGB videos has been widely studied in recent years however its 3
D point cloud counterpart remains under-explored despite the clear value that 3D
 information may bring. This is mostly due to the inherent limitation of the poi
nt cloud data modality---lack of structure permutation invariance and varying nu
mber of points---which makes it difficult to learn a spatio-temporal representat
ion. To address this limitation we propose the 3DinAction pipeline that first es
timates patches moving in time (t-patches) as a key building block alongside a h
ierarchical architecture that learns an informative spatio-temporal representati
on. We show that our method achieves improved performance on existing datasets i
ncluding DFAUST and IKEA ASM. Code is publicly available at https://github.com/s
itzikbs/3dincaction

Cache Me if You Can: Accelerating Diffusion Models through Block Caching
Felix Wimbauer, Bichen Wu, Edgar Schoenfeld, Xiaoliang Dai, Ji Hou, Zijian He, A
rtsiom Sanakoyeu, Peizhao Zhang, Sam Tsai, Jonas Kohler, Christian Rupprecht, Da
niel Cremers, Peter Vajda, Jialiang Wang; Proceedings of the IEEE/CVF Conference
 on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 6211-6220
Diffusion models have recently revolutionized the field of image synthesis due t
o their ability to generate photorealistic images. However one of the major draw
backs of diffusion models is that the image generation process is costly. A larg

e image-to-image network has to be applied many times to iteratively refine an i
mage from random noise. While many recent works propose techniques to reduce the
 number of required steps they generally treat the underlying denoising network
as a black box. In this work we investigate the behavior of the layers within th
e network and find that 1) the layers' output changes smoothly over time 2) the
layers show distinct patterns of change and 3) the change from step to step is o
ften very small. We hypothesize that many layer computations in the denoising ne
twork are redundant. Leveraging this we introduce Block Caching in which we reus
e outputs from layer blocks of previous steps to speed up inference. Furthermore
 we propose a technique to automatically determine caching schedules based on ea
ch block's changes over timesteps. In our experiments we show through FID human
evaluation and qualitative analysis that Block Caching allows to generate images
 with higher visual quality at the same computational cost. We demonstrate this
for different state-of-the-art models (LDM and EMU) and solvers (DDIM and DPM).

MedM2G: Unifying Medical Multi-Modal Generation via Cross-Guided Diffusion with
Visual Invariant
Chenlu Zhan, Yu Lin, Gaoang Wang, Hongwei Wang, Jian Wu; Proceedings of the IEEE
/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 115
02-11512
Medical generative models acknowledged for their high-quality sample generation
ability have accelerated the fast growth of medical applications. However recent
 works concentrate on separate medical generation models for distinct medical ta
sks and are restricted to inadequate medical multi-modal knowledge constraining
medical comprehensive diagnosis. In this paper we propose MedM2G a Medical Multi
-Modal Generative framework with the key innovation to align extract and generat
e medical multi-modal within a unified model. Extending beyond single or two med
ical modalities we efficiently align medical multi-modal through the central ali
gnment approach in the unified space. Significantly our framework extracts valua
ble clinical knowledge by preserving the medical visual invariant of each imagin
g modal thereby enhancing specific medical information for multi-modal generatio
n. By conditioning the adaptive cross-guided parameters into the multi-flow diff
usion framework our model promotes flexible interactions among medical multi-mod
al for generation. MedM2G is the first medical generative model that unifies med
ical generation tasks of text-to-image image-to-text and unified generation of m
edical modalities (CT MRI X-ray). It performs 5 medical generation tasks across
10 datasets consistently outperforming various state-of-the-art works.

SDDGR: Stable Diffusion-based Deep Generative Replay for Class Incremental Objec
t Detection
Junsu Kim, Hoseong Cho, Jihyeon Kim, Yihalem Yimolal Tiruneh, Seungryul Baek; Pr
oceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition
(CVPR), 2024, pp. 28772-28781
In the field of class incremental learning (CIL) generative replay has become in
creasingly prominent as a method to mitigate the catastrophic forgetting alongsi
de the continuous improvements in generative models. However its application in
class incremental object detection (CIOD) has been significantly limited primari
ly due to the complexities of scenes involving multiple labels. In this paper we
 propose a novel approach called stable diffusion deep generative replay (SDDGR)
 for CIOD. Our method utilizes a diffusion-based generative model with pre-train
ed text-to-image diffusion networks to generate realistic and diverse synthetic
images. SDDGR incorporates an iterative refinement strategy to produce high-qual
ity images encompassing old classes. Additionally we adopt an L2 knowledge disti
llation technique to improve the retention of prior knowledge in synthetic image
s. Furthermore our approach includes pseudo-labeling for old objects within new
task images preventing misclassification as background elements. Extensive exper
iments on the COCO 2017 dataset demonstrate that SDDGR significantly outperforms
 existing algorithms achieving a new state-of-the-art in various CIOD scenarios.
****
Neural Parametric Gaussians for Monocular Non-Rigid Object Reconstruction

Devikalyan Das, Christopher Wewer, Raza Yunus, Eddy Ilg, Jan Eric Lenssen; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 10715-10725
Reconstructing dynamic objects from monocular videos is a severely underconstrained and challenging problem and recent work has approached it in various directions. However owing to the ill-posed nature of this problem there has been no solution that can provide consistent high-quality novel views from camera positions that are significantly different from the training views. In this work we introduce Neural Parametric Gaussians (NPGs) to take on this challenge by imposing a two-stage approach: first we fit a low-rank neural deformation model which then is used as regularization for non-rigid reconstruction in the second stage. The first stage learns the object's deformations such that it preserves consistency in novel views. The second stage obtains high reconstruction quality by optimizing 3D Gaussians that are driven by the coarse model. To this end we introduce a local 3D Gaussian representation where temporally shared Gaussians are anchored in and deformed by local oriented volumes. The resulting combined model can be rendered as radiance fields resulting in high-quality photo-realistic reconstructions of the non-rigidly deforming objects. We demonstrate that NPGs achieve superior results compared to previous works especially in challenging scenarios with few multi-view cues.

Physical 3D Adversarial Attacks against Monocular Depth Estimation in Autonomous Driving
Junhao Zheng, Chenhao Lin, Jiahao Sun, Zhengyu Zhao, Qian Li, Chao Shen; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 24452-24461
Deep learning-based monocular depth estimation (MDE) extensively applied in autonomous driving is known to be vulnerable to adversarial attacks. Previous physical attacks against MDE models rely on 2D adversarial patches so they only affect a small localized region in the MDE map but fail under various viewpoints. To address these limitations we propose 3D Depth Fool (3D^2Fool) the first 3D texture-based adversarial attack against MDE models. 3D^2Fool is specifically optimized to generate 3D adversarial textures agnostic to model types of vehicles and to have improved robustness in bad weather conditions such as rain and fog. Experimental results validate the superior performance of our 3D^2Fool across various scenarios including vehicles MDE models weather conditions and viewpoints. Real-world experiments with printed 3D textures on physical vehicle models further demonstrate that our 3D^2Fool can cause an MDE error of over 10 meters.

Adaptive Random Feature Regularization on Fine-tuning Deep Neural Networks
Shin'ya Yamaguchi, Sekitoshi Kanai, Kazuki Adachi, Daiki Chijiwa; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 23481-23490
While fine-tuning is a de facto standard method for training deep neural networks it still suffers from overfitting when using small target datasets. Previous methods improve fine-tuning performance by maintaining knowledge of the source datasets or introducing regularization terms such as contrastive loss. However these methods require auxiliary source information (e.g. source labels or datasets) or heavy additional computations. In this paper we propose a simple method called adaptive random feature regularization (AdaRand). AdaRand helps the feature extractors of training models to adaptively change the distribution of feature vectors for downstream classification tasks without auxiliary source information and with reasonable computation costs. To this end AdaRand minimizes the gap between feature vectors and random reference vectors that are sampled from class conditional Gaussian distributions. Furthermore AdaRand dynamically updates the conditional distribution to follow the currently updated feature extractors and balance the distance between classes in feature spaces. Our experiments show that AdaRand outperforms the other fine-tuning regularization requiring auxiliary source information and heavy computation costs.

PH-Net: Semi-Supervised Breast Lesion Segmentation via Patch-wise Hardness
Siyao Jiang, Huisi Wu, Junyang Chen, Qin Zhang, Jing Qin; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 11418-11427
We present a novel semi-supervised framework for breast ultrasound (BUS) image segmentation which is a very challenging task owing to (1) large scale and shape variations of breast lesions and (2) extremely ambiguous boundaries caused by massive speckle noise and artifacts in BUS images. While existing models achieved certain progress in this task we believe the main bottleneck nowadays for further improvement is that we still cannot deal with hard cases well. Our framework aims to break through this bottleneck which includes two innovative components: an adaptive patch augmentation scheme and a hard-patch contrastive learning module. We first identify hard patches by computing the average entropy of each patch and then shield hard patches to prevent them from being cropped out while performing random patch cutmix. Such a scheme is able to prevent hard regions from being inadequately trained under strong augmentation. We further develop a new hard-patch contrastive learning algorithm to direct model attention to hard regions by applying extra contrast to pixels in hard patches further improving segmentation performance on hard cases. We demonstrate the superiority of our framework to state-of-the-art approaches on two famous BUS datasets achieving better performance under different labeling conditions. The code is available at https://github.com/jjjsyyy/PH-Net.
****
Multimodal Prompt Perceiver: Empower Adaptiveness Generalizability and Fidelity for All-in-One Image Restoration
Yuang Ai, Huaibo Huang, Xiaoqiang Zhou, Jiexiang Wang, Ran He; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 25432-25444
Despite substantial progress all-in-one image restoration (IR) grapples with persistent challenges in handling intricate real-world degradations. This paper introduces MPerceiver: a novel multimodal prompt learning approach that harnesses Stable Diffusion (SD) priors to enhance adaptiveness generalizability and fidelity for all-in-one image restoration. Specifically we develop a dual-branch module to master two types of SD prompts: textual for holistic representation and visual for multiscale detail representation. Both prompts are dynamically adjusted by degradation predictions from the CLIP image encoder enabling adaptive responses to diverse unknown degradations. Moreover a plug-in detail refinement module improves restoration fidelity via direct encoder-to-decoder information transformation. To assess our method MPerceiver is trained on 9 tasks for all-in-one IR and outperforms state-of-the-art task-specific methods across many tasks. Post multitask pre-training MPerceiver attains a generalized representation in low-level vision exhibiting remarkable zero-shot and few-shot capabilities in unseen tasks. Extensive experiments on 16 IR tasks underscore the superiority of MPerceiver in terms of adaptiveness generalizability and fidelity.
****
ExACT: Language-guided Conceptual Reasoning and Uncertainty Estimation for Event-based Action Recognition and More
Jiazhou Zhou, Xu Zheng, Yuanhuiyi Lyu, Lin Wang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 18633-18643
Event cameras have recently been shown beneficial for practical vision tasks such as action recognition thanks to their high temporal resolution power efficiency and reduced privacy concerns. However current research is hindered by 1) the difficulty in processing events because of their prolonged duration and dynamic actions with complex and ambiguous semantics and 2) the redundant action depiction of the event frame representation with fixed stacks. We find language naturally conveys abundant semantic information rendering it stunningly superior in reducing semantic uncertainty. In light of this we propose ExACT a novel approach that for the first time tackles event-based action recognition from a cross-modal conceptualizing perspective. Our ExACT brings two technical contributions. Firstly we propose an adaptive fine-grained event (AFE) representation to adaptively

filter out the repeated events for the stationary objects while preserving dynam
ic ones. This subtly enhances the performance of ExACT without extra computation
al cost. Then we propose a conceptual reasoning-based uncertainty estimation mod
ule which simulates the recognition process to enrich the semantic representatio
n. In particular conceptual reasoning builds the temporal relation based on the
action semantics and uncertainty estimation tackles the semantic uncertainty of
actions based on the distributional representation. Experiments show that our Ex
ACT achieves superior recognition accuracy of 94.83%(+2.23%) 90.10%(+37.47%) and
67.24% on PAF HARDVS and our SeAct datasets respectively.

Color Shift Estimation-and-Correction for Image Enhancement
Yiyu Li, Ke Xu, Gerhard Petrus Hancke, Rynson W.H. Lau; Proceedings of the IEEE/
CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 2538
9-25398
Images captured under sub-optimal illumination conditions may contain both over-
and under-exposures. We observe that over- and over-exposed regions display opp
osite color tone distribution shifts which may not be easily normalized in joint
modeling as they usually do not have "normal-exposed" regions/pixels as referen
ce. In this paper we propose a novel method to enhance images with both over- an
d under-exposures by learning to estimate and correct such color shifts. Specifi
cally we first derive the color feature maps of the brightened and darkened vers
ions of the input image via a UNet-based network followed by a pseudo-normal fea
ture generator to produce pseudo-normal color feature maps. We then propose a no
vel COlor Shift Estimation (COSE) module to estimate the color shifts between th
e derived brightened (or darkened) color feature maps and the pseudo-normal colo
r feature maps. The COSE module corrects the estimated color shifts of the over-
and under-exposed regions separately. We further propose a novel COlor MOdulati
on (COMO) module to modulate the separately corrected colors in the over- and un
der-exposed regions to produce the enhanced image. Comprehensive experiments sho
w that our method outperforms existing approaches.

Improving Visual Recognition with Hyperbolical Visual Hierarchy Mapping
Hyeongjun Kwon, Jinhyun Jang, Jin Kim, Kwonyoung Kim, Kwanghoon Sohn; Proceeding
s of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR),
2024, pp. 17364-17374
Visual scenes are naturally organized in a hierarchy where a coarse semantic is
recursively comprised of several fine details. Exploring such a visual hierarchy
is crucial to recognize the complex relations of visual elements leading to a c
omprehensive scene understanding. In this paper we propose a Visual Hierarchy Ma
pper (Hi-Mapper) a novel approach for enhancing the structured understanding of
the pre-trained Deep Neural Networks (DNNs). Hi-Mapper investigates the hierarch
ical organization of the visual scene by 1) pre-defining a hierarchy tree throug
h the encapsulation of probability densities; and 2) learning the hierarchical r
elations in hyperbolic space with a novel hierarchical contrastive loss. The pre
-defined hierarchy tree recursively interacts with the visual features of the pr
e-trained DNNs through hierarchy decomposition and encoding procedures thereby e
ffectively identifying the visual hierarchy and enhancing the recognition of an
entire scene. Extensive experiments demonstrate that Hi-Mapper significantly enh
ances the representation capability of DNNs leading to an improved performance o
n various tasks including image classification and dense prediction tasks.

ParameterNet: Parameters Are All You Need for Large-scale Visual Pretraining of
Mobile Networks
Kai Han, Yunhe Wang, Jianyuan Guo, Enhua Wu; Proceedings of the IEEE/CVF Confere
nce on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 15751-15761
The large-scale visual pretraining has significantly improve the performance of
large vision models. However we observe the low FLOPs pitfall that the existing
low-FLOPs models cannot benefit from large-scale pretraining. In this paper we i
ntroduce a novel design principle termed ParameterNet aimed at augmenting the nu
mber of parameters in large-scale visual pretraining models while minimizing the

increase in FLOPs. We leverage dynamic convolutions to incorporate additional parameters into the networks with only a marginal rise in FLOPs. The ParameterNet approach allows low-FLOPs networks to take advantage of large-scale visual pretraining. Furthermore we extend the ParameterNet concept to the language domain to enhance inference results while preserving inference speed. Experiments on the large-scale ImageNet-22K have shown the superiority of our ParameterNet scheme. For example ParameterNet-600M can achieve higher accuracy than the widely-used Swin Transformer (81.6% vs. 80.9%) and has much lower FLOPs (0.6G vs. 4.5G). The code will be released at https://parameternet.github.io/.

Repurposing Diffusion-Based Image Generators for Monocular Depth Estimation
Bingxin Ke, Anton Obukhov, Shengyu Huang, Nando Metzger, Rodrigo Caye Daudt, Konrad Schindler; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 9492-9502
Monocular depth estimation is a fundamental computer vision task. Recovering 3D depth from a single image is geometrically ill-posed and requires scene understanding so it is not surprising that the rise of deep learning has led to a breakthrough. The impressive progress of monocular depth estimators has mirrored the growth in model capacity from relatively modest CNNs to large Transformer architectures. Still monocular depth estimators tend to struggle when presented with images with unfamiliar content and layout since their knowledge of the visual world is restricted by the data seen during training and challenged by zero-shot generalization to new domains. This motivates us to explore whether the extensive priors captured in recent generative diffusion models can enable better more generalizable depth estimation. We introduce Marigold a method for affine-invariant monocular depth estimation that is derived from Stable Diffusion and retains its rich prior knowledge. The estimator can be fine-tuned in a couple of days on a single GPU using only synthetic training data. It delivers state-of-the-art performance across a wide range of datasets including over 20% performance gains in specific cases. Project page: https://marigoldmonodepth.github.io.

Identifying Important Group of Pixels using Interactions
Kosuke Sumiyasu, Kazuhiko Kawamoto, Hiroshi Kera; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 6017-6026
To better understand the behavior of image classifiers it is useful to visualize the contribution of individual pixels to the model prediction. In this study we propose a method MoXI(Model eXplanation by Interactions) that efficiently and accurately identifies a group of pixels with high prediction confidence. The proposed method employs game-theoretic concepts Shapley values and interactions taking into account the effects of individual pixels and the cooperative influence of pixels on model confidence. Theoretical analysis and experiments demonstrate that our method better identifies the pixels that are highly contributing to the model outputs than widely-used by Grad-CAM Attention rollout and Shapley value. While prior studies have suffered from the exponential computational cost in the computation of Shapley value and interactions we show that this can be reduced to quadratic cost for our task. The code is available at https://github.com/KosukeSumiyasu/MoXI.
****
Towards Scalable 3D Anomaly Detection and Localization: A Benchmark via 3D Anomaly Synthesis and A Self-Supervised Learning Network
Wenqiao Li, Xiaohao Xu, Yao Gu, Bozhong Zheng, Shenghua Gao, Yingna Wu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 22207-22216
Recently 3D anomaly detection a crucial problem involving fine-grained geometry discrimination is getting more attention. However the lack of abundant real 3D anomaly data limits the scalability of current models. To enable scalable anomaly data collection we propose a 3D anomaly synthesis pipeline to adapt existing large-scale 3D models for 3D anomaly detection. Specifically we construct a synthetic dataset i.e. Anomaly-ShapeNet based on ShapeNet. Anomaly-ShapeNet consists of 1600 point cloud samples under 40 categories which provides a rich and varied

collection of data enabling efficient training and enhancing adaptability to ind
ustrial scenarios. Meanwhile to enable scalable representation learning for 3D a
nomaly localization we propose a self-supervised method i.e. Iterative Mask Reco
nstruction Network (IMRNet). During training we propose a geometry-aware sample
module to preserve potentially anomalous local regions during point cloud down-s
ampling. Then we randomly mask out point patches and sent the visible patches to
 a transformer for reconstruction-based self-supervision. During testing the poi
nt cloud repeatedly goes through the Mask Reconstruction Network with each itera
tion's output becoming the next input. By merging and contrasting the final reco
nstructed point cloud with the initial input our method successfully locates ano
malies. Experiments show that IMRNet outperforms previous state-of-the-art metho
ds achieving 66.1% in I-AUC on our Anomaly-ShapeNet dataset and 72.5% in I-AUC o
n Real3D-AD dataset. Our benchmark will be released at https://github.com/Choppe
r233/Anomaly-ShapeNet.

Cam4DOcc: Benchmark for Camera-Only 4D Occupancy Forecasting in Autonomous Drivi
ng Applications
Junyi Ma, Xieyuanli Chen, Jiawei Huang, Jingyi Xu, Zhen Luo, Jintao Xu, Weihao G
u, Rui Ai, Hesheng Wang; Proceedings of the IEEE/CVF Conference on Computer Visi
on and Pattern Recognition (CVPR), 2024, pp. 21486-21495
Understanding how the surrounding environment changes is crucial for performing
downstream tasks safely and reliably in autonomous driving applications. Recent
occupancy estimation techniques using only camera images as input can provide de
nse occupancy representations of large-scale scenes based on the current observa
tion. However they are mostly limited to representing the current 3D space and d
o not consider the future state of surrounding objects along the time axis. To e
xtend camera-only occupancy estimation into spatiotemporal prediction we propose
 Cam4DOcc a new benchmark for camera-only 4D occupancy forecasting evaluating th
e surrounding scene changes in a near future. We build our benchmark based on mu
ltiple publicly available datasets including nuScenes nuScenes-Occupancy and Lyf
t-Level5 which provides sequential occupancy states of general movable and stati
c objects as well as their 3D backward centripetal flow. To establish this bench
mark for future research with comprehensive comparisons we introduce four baseli
ne types from diverse camera-based perception and prediction implementations inc
luding a static-world occupancy model voxelization of point cloud prediction 2D-
3D instance-based prediction and our proposed novel end-to-end 4D occupancy fore
casting network. Furthermore the standardized evaluation protocol for preset mul
tiple tasks is also provided to compare the performance of all the proposed base
lines on present and future occupancy estimation with respect to objects of inte
rest in autonomous driving scenarios. The dataset and our implementation of all
four baselines in the proposed Cam4DOcc benchmark are released as open source at
 https://github.com/haomo-ai/Cam4DOcc.

DIOD: Self-Distillation Meets Object Discovery
Sandra Kara, Hejer Ammar, Julien Denize, Florian Chabot, Quoc-Cuong Pham; Procee
dings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVP
R), 2024, pp. 3975-3985
Instance segmentation demands substantial labeling resources. This has prompted
increased interest to explore the object discovery task as an unsupervised alter
native. In particular promising results were achieved in localizing instances us
ing motion supervision only. However the motion signal introduces complexities d
ue to its inherent noise and sparsity which constrains the effectiveness of curr
ent methodologies. In the present paper we propose DIOD (self DIstillation meets
 Object Discovery) the first method that places the motion-guided object discove
ry within a framework of continuous improvement through knowledge distillation p
roviding solutions to existing limitations (i) DIOD robustly eliminates the nois
e present in the exploited motion maps providing accurate motion-supervision (ii
) DIOD leverages the discovered objects within an iterative pseudo-labeling fram
ework enriching the initial motion-supervision with static objects which results
 in a cost-efficient increase in performance. Through experiments on synthetic a

nd real-world datasets we demonstrate the benefits of bridging the gap between object discovery and distillation by significantly improving the state-of-the-art. This enhancement is also sustained across other demanding metrics so far reserved for supervised tasks.

GoMAvatar: Efficient Animatable Human Modeling from Monocular Video Using Gaussians-on-Mesh
Jing Wen, Xiaoming Zhao, Zhongzheng Ren, Alexander G. Schwing, Shenlong Wang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 2059-2069
We introduce GoMAvatar a novel approach for real-time memory-efficient high-quality animatable human modeling. GoMAvatar takes as input a single monocular video to create a digital avatar capable of re-articulation in new poses and real-time rendering from novel viewpoints while seamlessly integrating with rasterization-based graphics pipelines. Central to our method is the Gaussians-on-Mesh (GoM) representation a hybrid 3D model combining rendering quality and speed of Gaussian splatting with geometry modeling and compatibility of deformable meshes. We assess GoMAvatar on ZJU-MoCap PeopleSnapshot and various YouTube videos. GoMAvatar matches or surpasses current monocular human modeling algorithms in rendering quality and significantly outperforms them in computational efficiency (43 FPS) while being memory-efficient (3.63 MB per subject).

Neural Redshift: Random Networks are not Random Functions
Damien Teney, Armand Mihai Nicolicioiu, Valentin Hartmann, Ehsan Abbasnejad; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 4786-4796
Our understanding of the generalization capabilities of neural networks NNs is still incomplete. Prevailing explanations are based on implicit biases of gradient descent GD but they cannot account for the capabilities of models from gradientfree methods nor the simplicity bias recently observed in untrained networks This paper seeks other sources of generalization in NNs. To understand the inductive biases provided by architectures independently from GD we examine untrained randomweight networks Even simple MLPs show strong inductive biases uniform sampling in weight space yields a very biased distribution of functions in terms of complexity But unlike common wisdom NNs do not have an inherent simplicity bias This property depends on components such as ReLUs residual connections and layer normalizations Alternative architectures can be built with a bias for any level of complexity. Transformers also inherit all these properties from their building blocks. We provide a fresh explanation for the success of deep learning independent from gradientbased training It points at promising avenues for controlling the solutions implemented by trained models.

HumanGaussian: Text-Driven 3D Human Generation with Gaussian Splatting
Xian Liu, Xiaohang Zhan, Jiaxiang Tang, Ying Shan, Gang Zeng, Dahua Lin, Xihui Liu, Ziwei Liu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 6646-6657
Realistic 3D human generation from text prompts is a desirable yet challenging task. Existing methods optimize 3D representations like mesh or neural fields via score distillation sampling (SDS) which suffers from inadequate fine details or excessive training time. In this paper we propose an efficient yet effective framework HumanGaussian that generates high-quality 3D humans with fine-grained geometry and realistic appearance. Our key insight is that 3D Gaussian Splatting is an efficient renderer with periodic Gaussian shrinkage or growing where such adaptive density control can be naturally guided by intrinsic human structures. Specifically 1) we first propose a Structure-Aware SDS that simultaneously optimizes human appearance and geometry. The multi-modal score function from both RGB and depth space is leveraged to distill the Gaussian densification and pruning process. 2) Moreover we devise an Annealed Negative Prompt Guidance by decomposing SDS into a noisier generative score and a cleaner classifier score which well addresses the over-saturation issue. The floating artifacts are further eliminat

ed based on Gaussian size in a prune-only phase to enhance generation smoothness. Extensive experiments demonstrate the superior efficiency and competitive quality of our framework rendering vivid 3D humans under diverse scenarios.

DIEM: Decomposition-Integration Enhancing Multimodal Insights
Xinyi Jiang, Guoming Wang, Junhao Guo, Juncheng Li, Wenqiao Zhang, Rongxing Lu, Siliang Tang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 27304-27313
In image question answering due to the abundant and sometimes redundant information precisely matching and integrating the information from both text and images is a challenge. In this paper we propose the Decomposition-Integration Enhancing Multimodal Insight (DIEM) which initially decomposes the given question and image into multiple subquestions and several sub-images aiming to isolate specific elements for more focused analysis. We then integrate these sub-elements by matching each subquestion with its relevant sub-images while also retaining the original image to construct a comprehensive answer to the original question without losing sight of the overall context. This strategy mirrors the human cognitive process of simplifying complex problems into smaller components for individual analysis followed by an integration of these insights. We implement DIEM on the LLaVA-v1.5 model and evaluate its performance on ScienceQA and MM-Vet. Experimental results indicate that our method boosts accuracy in most question classes of the ScienceQA (+2.03% in average) especially in the image modality (+3.40%). On MM-Vet our method achieves an improvement in MM-Vet scores increasing from 31.1 to 32.4. These findings highlight DIEM's effectiveness in harmonizing the complexities of multimodal data demonstrating its ability to enhance accuracy and depth in image question answering through its decomposition-integration process.

CosmicMan: A Text-to-Image Foundation Model for Humans
Shikai Li, Jianglin Fu, Kaiyuan Liu, Wentao Wang, Kwan-Yee Lin, Wayne Wu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 6955-6965
We present CosmicMan a text-to-image foundation model specialized for generating high-fidelity human images. Unlike current general-purpose foundation models that are stuck in the dilemma of inferior quality and text-image misalignment for humans CosmicMan enables generating photo-realistic human images with meticulous appearance reasonable structure and precise text-image alignment with detailed dense descriptions. At the heart of CosmicMan's success are the new reflections and perspectives on data and models: (1) We found that data quality and a scalable data production flow are essential for the final results from trained models. Hence we propose a new data production paradigm Annotate Anyone which serves as a perpetual data flywheel to produce high-quality data with accurate yet cost-effective annotations over time. Based on this we constructed a large-scale dataset CosmicMan-HQ 1.0 with 6 Million high-quality real-world human images in a mean resolution of 1488x1255 and attached with precise text annotations deriving from 115 Million attributes in diverse granularities. (2) We argue that a text-to-image foundation model specialized for humans must be pragmatic - easy to integrate into down-streaming tasks while effective in producing high-quality human images. Hence we propose to model the relationship between dense text descriptions and image pixels in a decomposed manner and present Decomposed-Attention-Refocusing (Daring) training framework. It seamlessly decomposes the cross-attention features in existing text-to-image diffusion model and enforces attention refocusing without adding extra modules. Through Daring we show that explicitly discretizing continuous text space into several basic groups that align with human body structure is the key to tackling the misalignment problem in a breeze. Project page: https://cosmicman-cvpr2024.github.io/.

LLMs are Good Sign Language Translators
Jia Gong, Lin Geng Foo, Yixuan He, Hossein Rahmani, Jun Liu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 18362-18372

Sign Language Translation (SLT) is a challenging task that aims to translate sign videos into spoken language. Inspired by the strong translation capabilities of large language models (LLMs) that are trained on extensive multilingual text corpora we aim to harness off-the-shelf LLMs to handle SLT. In this paper we regularize the sign videos to embody linguistic characteristics of spoken language and propose a novel SignLLM framework to transform sign videos into a language-like representation for improved readability by off-the-shelf LLMs. SignLLM comprises two key modules: (1) The Vector-Quantized Visual Sign module converts sign videos into a sequence of discrete character-level sign tokens and (2) the Codebook Reconstruction and Alignment module converts these character-level tokens into word-level sign representations using an optimal transport formulation. A sign-text alignment loss further bridges the gap between sign and text tokens enhancing semantic compatibility. We achieve state-of-the-art gloss-free results on two widely-used SLT benchmarks.

Contrastive Pre-Training with Multi-View Fusion for No-Reference Point Cloud Quality Assessment
Ziyu Shan, Yujie Zhang, Qi Yang, Haichen Yang, Yiling Xu, Jenq-Neng Hwang, Xiaozhong Xu, Shan Liu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 25942-25951
No-reference point cloud quality assessment (NR-PCQA) aims to automatically evaluate the perceptual quality of distorted point clouds without available reference which have achieved tremendous improvements due to the utilization of deep neural networks. However learning-based NR-PCQA methods suffer from the scarcity of labeled data and usually perform suboptimally in terms of generalization. To solve the problem we propose a novel contrastive pre-training framework tailored for PCQA (CoPA) which enables the pre-trained model to learn quality-aware representations from unlabeled data. To obtain anchors in the representation space we project point clouds with different distortions into images and randomly mix their local patches to form mixed images with multiple distortions. Utilizing the generated anchors we constrain the pre-training process via a quality-aware contrastive loss following the philosophy that perceptual quality is closely related to both content and distortion. Furthermore in the model fine-tuning stage we propose a semantic-guided multi-view fusion module to effectively integrate the features of projected images from multiple perspectives. Extensive experiments show that our method outperforms the state-of-the-art PCQA methods on popular benchmarks. Further investigations demonstrate that CoPA can also benefit existing learning-based PCQA models.
****
JDEC: JPEG Decoding via Enhanced Continuous Cosine Coefficients
Woo Kyoung Han, Sunghoon Im, Jaedeok Kim, Kyong Hwan Jin; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 2784-2793
We propose a practical approach to JPEG image decoding utilizing a local implicit neural representation with continuous cosine formulation. The JPEG algorithm significantly quantizes discrete cosine transform (DCT) spectra to achieve a high compression rate inevitably resulting in quality degradation while encoding an image. We have designed a continuous cosine spectrum estimator to address the quality degradation issue that restores the distorted spectrum. By leveraging local DCT formulations our network has the privilege to exploit dequantization and upsampling simultaneously. Our proposed model enables decoding compressed images directly across different quality factors using a single pre-trained model without relying on a conventional JPEG decoder. As a result our proposed network achieves state-of-the-art performance in flexible color image JPEG artifact removal tasks. Our source code is available at https://github.com/WooKyoungHan/JDEC

Revisiting the Domain Shift and Sample Uncertainty in Multi-source Active Domain Transfer
Wenqiao Zhang, Zheqi Lv, Hao Zhou, Jia-Wei Liu, Juncheng Li, Mengze Li, Yunfei Li, Dongping Zhang, Yueting Zhuang, Siliang Tang; Proceedings of the IEEE/CVF Con

ference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 16751-16761
Active Domain Adaptation (ADA) aims to maximally boost model adaptation in a new target domain by actively selecting a limited number of target data to annotate. This setting neglects the more practical scenario where training data are collected from multiple sources. This motivates us to extend ADA from a single source domain to multiple source domains termed Multi-source Active Domain Adaptation (MADA). Not surprisingly we find that most traditional ADA methods cannot work directly in such a setting mainly due to the excessive domain gap introduced by all the source domains. Considering this we propose a Detective framework that comprehensively considers the domain shift between multi-source domains and target domains to detect the informative target samples. Specifically the Detective leverages a dynamic Domain Adaptation (DA) model that learns how to adapt the model's parameters to fit the union of multi-source domains. This enables an approximate single-source domain modeling by the dynamic model. We then comprehensively measure both domain uncertainty and predictive uncertainty in the target domain to detect informative target samples using evidential deep learning thereby mitigating uncertainty miscalibration. Experiments demonstrate that our solution outperforms existing methods by a considerable margin on three domain adaptation benchmarks.

Learning Continual Compatible Representation for Re-indexing Free Lifelong Person Re-identification
Zhenyu Cui, Jiahuan Zhou, Xun Wang, Manyu Zhu, Yuxin Peng; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 16614-16623
Lifelong Person Re-identification (L-ReID) aims to learn from sequentially collected data to match a person across different scenes. Once an L-ReID model is updated using new data all historical images in the gallery are required to be re-calculated to obtain new features for testing known as "re-indexing". However it is infeasible when raw images in the gallery are unavailable due to data privacy concerns resulting in incompatible retrieval between the query and the gallery features calculated by different models which causes significant performance degradation. In this paper we focus on a new task called Re-indexing Free Lifelong Person Re-identification (RFL-ReID) which requires achieving effective L-ReID without re-indexing raw images in the gallery. To this end we propose a Continual Compatible Representation (C2R) method which facilitates the query feature calculated by the continuously updated model to effectively retrieve the gallery feature calculated by the old model in a compatible manner. Specifically we design a Continual Compatible Transfer (CCT) network to continuously transfer and consolidate the old gallery feature into the new feature space. Besides a Balanced Compatible Distillation module is introduced to achieve compatibility by aligning the transferred feature space with the new feature space. Finally a Balanced Anti-forgetting Distillation module is proposed to eliminate the accumulated forgetting of old knowledge during the continual compatible transfer. Extensive experiments on several benchmark L-ReID datasets demonstrate the effectiveness of our method against state-of-the-art methods for both RFL-ReID and L-ReID tasks. The source code of this paper is available at https://github.com/PKU-ICST-MIPL/C2R_CVPR2024.

Revisiting Spatial-Frequency Information Integration from a Hierarchical Perspective for Panchromatic and Multi-Spectral Image Fusion
Jiangtong Tan, Jie Huang, Naishan Zheng, Man Zhou, Keyu Yan, Danfeng Hong, Feng Zhao; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 25922-25931
Pan-sharpening is a super-resolution problem that essentially relies on spectra fusion of panchromatic (PAN) images and low-resolution multi-spectral (LRMS) images. The previous methods have validated the effectiveness of information fusion in the Fourier space of the whole image. However they haven't fully explored the Fourier relationships at different hierarchies between PAN and LRMS images. To this end we propose a Hierarchical Frequency Integration Network (HFIN) to faci

litate hierarchical Fourier information integration for pan-sharpening. Specifically our network consists of two designs: information stratification and information integration. For information stratification we hierarchically decompose PAN and LRMS information into spatial global Fourier and local Fourier information and fuse them independently. For information integration the above hierarchical fused information is processed to further enhance their relationships and undergo comprehensive integration. Our method extend a new space for exploring the relationships of PAN and LRMS images enhancing the integration of spatial-frequency information. Extensive experiments robustly validate the effectiveness of the proposed network showcasing its superior performance compared to other state-of-the-art methods and generalization in real-world scenes and other fusion tasks as a general image fusion framework. Code is available at https://github.com/JosephTiTan/HFIN.

BSNet: Box-Supervised Simulation-assisted Mean Teacher for 3D Instance Segmentation
Jiahao Lu, Jiacheng Deng, Tianzhu Zhang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 20374-20384
3D instance segmentation (3DIS) is a crucial task but point-level annotations are tedious in fully supervised settings. Thus using bounding boxes (bboxes) as annotations has shown great potential. The current mainstream approach is a two-step process involving the generation of pseudo-labels from box annotations and the training of a 3DIS network with the pseudo-labels. However due to the presence of intersections among bboxes not every point has a determined instance label especially in overlapping areas. To generate higher quality pseudo-labels and achieve more precise weakly supervised 3DIS results we propose the Box-Supervised Simulation-assisted Mean Teacher for 3D Instance Segmentation (BSNet) which devises a novel pseudo-labeler called Simulation-assisted Transformer. The labeler consists of two main components. The first is Simulation-assisted Mean Teacher which introduces Mean Teacher for the first time in this task and constructs simulated samples to assist the labeler in acquiring prior knowledge about overlapping areas. To better model local-global structure we also propose Local-Global Aware Attention as the decoder for teacher and student labelers. Extensive experiments conducted on the ScanNetV2 and S3DIS datasets verify the superiority of our designs.

Adaptive Slot Attention: Object Discovery with Dynamic Slot Number
Ke Fan, Zechen Bai, Tianjun Xiao, Tong He, Max Horn, Yanwei Fu, Francesco Locatello, Zheng Zhang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 23062-23071
Object-centric learning (OCL) extracts the representation of objects with slots offering an exceptional blend of flexibility and interpretability for abstracting low-level perceptual features. A widely adopted method within OCL is slot attention which utilizes attention mechanisms to iteratively refine slot representations. However a major drawback of most object-centric models including slot attention is their reliance on predefining the number of slots. This not only necessitates prior knowledge of the dataset but also overlooks the inherent variability in the number of objects present in each instance. To overcome this fundamental limitation we present a novel complexity-aware object auto-encoder framework. Within this framework we introduce an adaptive slot attention (AdaSlot) mechanism that dynamically determines the optimal number of slots based on the content of the data. This is achieved by proposing a discrete slot sampling module that is responsible for selecting an appropriate number of slots from a candidate list. Furthermore we introduce a masked slot decoder that suppresses unselected slots during the decoding process. Our framework tested extensively on object discovery tasks with various datasets shows performance matching or exceeding top fixed-slot models. Moreover our analysis substantiates that our method exhibits the capability to dynamically adapt the slot number according to each instance's complexity offering the potential for further exploration in slot attention research. Project will be available at https://kfan21.github.io/AdaSlot/

CORES: Convolutional Response-based Score for Out-of-distribution Detection
Keke Tang, Chao Hou, Weilong Peng, Runnan Chen, Peican Zhu, Wenping Wang, Zhihon
g Tian; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Re
cognition (CVPR), 2024, pp. 10916-10925
Deep neural networks (DNNs) often display overconfidence when encountering out-o
f-distribution (OOD) samples posing significant challenges in real-world applica
tions. Capitalizing on the observation that responses on convolutional kernels a
re generally more pronounced for in-distribution (ID) samples than for OOD ones
this paper proposes the COnvolutional REsponse-based Score (CORES) to exploit th
ese discrepancies for OOD detection. Initially CORES delves into the extremities
 of convolutional responses by considering both their magnitude and the frequenc
y of significant values. Moreover through backtracking from the most prominent p
redictions CORES effectively pinpoints sample-relevant kernels across different
layers. These kernels which exhibit a strong correlation to input samples are in
tegral to CORES's OOD detection capability. Comprehensive experiments across var
ious ID and OOD settings demonstrate CORES's effectiveness in OOD detection and
its superiority to the state-of-the-art methods.

Task-Driven Wavelets using Constrained Empirical Risk Minimization
Eric Marcus, Ray Sheombarsing, Jan-Jakob Sonke, Jonas Teuwen; Proceedings of the
 IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp
. 24098-24107
Deep Neural Networks (DNNs) are widely used for their ability to effectively app
roximate large classes of functions. This flexibility however makes the strict e
nforcement of constraints on DNNs a difficult problem. In contexts where it is c
ritical to limit the function space to which certain network components belong s
uch as wavelets employed in Multi-Resolution Analysis (MRA) naive constraints vi
a additional terms in the loss function are inadequate. To address this we intro
duce a Convolutional Neural Network (CNN) wherein the convolutional filters are
strictly constrained to be wavelets. This allows the filters to update to task-o
ptimized wavelets during the training procedure. Our primary contribution lies i
n the rigorous formulation of these filters via a constrained empirical risk min
imization framework thereby providing an exact mechanism to enforce these struct
ural constraints. While our work is grounded in theory we investigate our approa
ch empirically through applications in medical imaging particularly in the task
of contour prediction around various organs achieving superior performance compa
red to baseline methods.

Interactive3D: Create What You Want by Interactive 3D Generation

Shaocong Dong, Lihe Ding, Zhanpeng Huang, Zibin Wang, Tianfan Xue, Dan Xu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 4999-5008
3D object generation has undergone significant advancements yielding high-quality results. However fall short in achieving precise user control often yielding results that do not align with user expectations thus limiting their applicability. User-envisioning 3D object generation faces significant challenges in realizing its concepts using current generative models due to limited interaction capabilities. Existing methods mainly offer two approaches: (i) interpreting textual instructions with constrained controllability or (ii) reconstructing 3D objects from 2D images. Both of them limit customization to the confines of the 2D reference and potentially introduce undesirable artifacts during the 3D lifting process restricting the scope for direct and versatile 3D modifications. In this work we introduce Interactive3D an innovative framework for interactive 3D generation that grants users precise control over the generative process through extensive 3D interaction capabilities. Interactive3D is constructed in two cascading stages utilizing distinct 3D representations. The first stage employs Gaussian Splatting for direct user interaction allowing modifications and guidance of the generative direction at any intermediate step through (i) Adding and Removing components (ii) Deformable and Rigid Dragging (iii) Geometric Transformations and (iv) Semantic Editing. Subsequently the Gaussian splats are transformed into InstantNGP. We introduce a novel (v) Interactive Hash Refinement module to further add details and extract the geometry in the second stage. Our experiments demonstrate that proposed Interactive3D markedly improves the controllability and quality of 3D generation. Our project webpage is available at https://interactive-3d.github.io/.

DeiT-LT: Distillation Strikes Back for Vision Transformer Training on Long-Tailed Datasets
Harsh Rangwani, Pradipto Mondal, Mayank Mishra, Ashish Ramayee Asokan, R. Venkatesh Babu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 23396-23406
Vision Transformer (ViT) has emerged as a prominent architecture for various computer vision tasks. In ViT we divide the input image into patch tokens and process them through a stack of self-attention blocks. However unlike Convolutional Neural Network (CNN) ViT's simple architecture has no informative inductive bias (e.g. locality etc.). Due to this ViT requires a large amount of data for pre-training. Various data-efficient approaches (DeiT) have been proposed to train ViT on balanced datasets effectively. However limited literature discusses the use of ViT for datasets with long-tailed imbalances. In this work we introduce DeiT-LT to tackle the problem of training ViTs from scratch on long-tailed datasets. In DeiT-LT we introduce an efficient and effective way of distillation from CNN via distillation \texttt DIST token by using out-of-distribution images and re-weighting the distillation loss to enhance focus on tail classes. This leads to the learning of local CNN-like features in early ViT blocks improving generalization for tail classes. Further to mitigate overfitting we propose distilling from a flat CNN teacher which leads to learning low-rank generalizable features for DIST tokens across all ViT blocks. With the proposed DeiT-LT scheme the distillation DIST token becomes an expert on the tail classes and the classifier CLS token becomes an expert on the head classes. The experts help to effectively learn features corresponding to both the majority and minority classes using a distinct set of tokens within the same ViT architecture. We show the effectiveness of DeiT-LT for training ViT from scratch on datasets ranging from small-scale CIFAR-10 LT to large-scale iNaturalist-2018. Project Page: https://rangwani-harsh.github.io/DeiT-LT.

Accurate Spatial Gene Expression Prediction by Integrating Multi-Resolution Features
Youngmin Chung, Ji Hun Ha, Kyeong Chan Im, Joo Sang Lee; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 115

91-11600
Recent advancements in Spatial Transcriptomics (ST) technology have facilitated detailed gene expression analysis within tissue contexts. However the high costs and methodological limitations of ST necessitate a more robust predictive model. In response this paper introduces TRIPLEX a novel deep learning framework designed to predict spatial gene expression from Whole Slide Images (WSIs). TRIPLEX uniquely harnesses multi-resolution features capturing cellular morphology at individual spots the local context around these spots and the global tissue organization. By integrating these features through an effective fusion strategy TRIPLEX achieves accurate gene expression prediction. Our comprehensive benchmark study conducted on three public ST datasets and supplemented with Visium data from 10X Genomics demonstrates that TRIPLEX outperforms current state-of-the-art models in Mean Squared Error (MSE) Mean Absolute Error (MAE) and Pearson Correlation Coefficient (PCC). The model's predictions align closely with ground truth gene expression profiles and tumor annotations underscoring TRIPLEX's potential in advancing cancer diagnosis and treatment.
****
FCS: Feature Calibration and Separation for Non-Exemplar Class Incremental Learning
Qiwei Li, Yuxin Peng, Jiahuan Zhou; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 28495-28504
Non-Exemplar Class Incremental Learning (NECIL) involves learning a classification model on a sequence of data without access to exemplars from previously encountered old classes. Such a stringent constraint always leads to catastrophic forgetting of the learned knowledge. Currently existing methods either employ knowledge distillation techniques or preserved class prototypes to sustain prior knowledge. However two critical issues still persist. On the one hand as the model is continually updated the preserved prototypes of old classes will inevitably derive from the suitable location in the feature space of the new model. On the other hand due to the lack of exemplars the features of new classes will take the place of similar old classes which breaks the classification boundary. To address these challenges we propose a Feature Calibration and Separation (FCS) method for NECIL. Our approach comprises a Feature Calibration Network (FCN) that adapts prototypes of old classes to the new model via optimal transport learning approximating the drift of prototypes caused by model evolution. Additionally we also propose a Prototype-Involved Contrastive Loss (PIC) that enhances feature separation among different classes. Specifically to mitigate the boundary distortion arising from the interplay of classes from different learning stages prototypes are involved in pushing the feature of new classes away from the old classes. Extensive experiments on three datasets with different settings have demonstrated the superiority of our FCS method against the state-of-the-art class incremental learning approaches. Code is available at https://github.com/zhoujiahuan1991/CVPR2024-FCS.

Task2Box: Box Embeddings for Modeling Asymmetric Task Relationships
Rangel Daroya, Aaron Sun, Subhransu Maji; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 28827-28837
Modeling and visualizing relationships between tasks or datasets is an important step towards solving various meta-tasks such as dataset discovery multi-tasking and transfer learning. However many relationships such as containment and transferability are naturally asymmetric and current approaches for representation and visualization (e.g. t-SNE) do not readily support this. We propose Task2Box an approach to represent tasks using box embeddings---axis-aligned hyperrectangles in low dimensional spaces---that can capture asymmetric relationships between them through volumetric overlaps. We show that Task2Box accurately predicts unseen hierarchical relationships between nodes in ImageNet and iNaturalist datasets as well as transferability between tasks in the Taskonomy benchmark. We also show that box embeddings estimated from task representations (e.g. CLIP Task2Vec or attribute based) can be used to predict relationships between unseen tasks more accurately than classifiers trained on the same representations as well as hand

crafted asymmetric distances (e.g. KL divergence). This suggests that low-dimens
ional box embeddings can effectively capture these task relationships and have t
he added advantage of being interpretable. We use the approach to visualize rela
tionships among publicly available image classification datasets on popular data
set hosting platform called Hugging Face.

Behind the Veil: Enhanced Indoor 3D Scene Reconstruction with Occluded Surfaces
Completion
Su Sun, Cheng Zhao, Yuliang Guo, Ruoyu Wang, Xinyu Huang, Yingjie Victor Chen, L
iu Ren; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Re
cognition (CVPR), 2024, pp. 12744-12753
In this paper we present a novel indoor 3D reconstruction method with occluded s
urface completion given a sequence of depth readings. Prior state-of-the-art (SO
TA) methods only focus on the reconstruction of the visible areas in a scene neg
lecting the invisible areas due to the occlusions e.g. the contact surface betwe
en furniture occluded wall and floor. Our method tackles the task of completing
the occluded scene surfaces resulting in a complete 3D scene mesh. The core idea
 of our method is learning 3D geometry prior from various complete scenes to inf
er the occluded geometry of an unseen scene from solely depth measurements. We d
esign a coarse-fine hierarchical octree representation coupled with a dual-decod
er architecture i.e. Geo-decoder and 3D Inpainter which jointly reconstructs the
 complete 3D scene geometry. The Geo-decoder with detailed representation at fin
e levels is optimized online for each scene to reconstruct visible surfaces. The
 3D Inpainter with abstract representation at coarse levels is trained offline u
sing various scenes to complete occluded surfaces. As a result while the Geo-dec
oder is specialized for an individual scene the 3D Inpainter can be generally ap
plied across different scenes. We evaluate the proposed method on the 3D Complet
ed Room Scene (3D-CRS) and iTHOR datasets significantly outperforming the SOTA m
ethods by a gain of 16.8% and 24.2% in terms of the completeness of 3D reconstru
ction. 3D-CRS dataset including a complete 3D mesh of each scene is provided at
project webpage.

VideoGrounding-DINO: Towards Open-Vocabulary Spatio-Temporal Video Grounding
Syed Talal Wasim, Muzammal Naseer, Salman Khan, Ming-Hsuan Yang, Fahad Shahbaz K
han; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recog
nition (CVPR), 2024, pp. 18909-18918
Video grounding aims to localize a spatio-temporal section in a video correspond
ing to an input text query. This paper addresses a critical limitation in curren
t video grounding methodologies by introducing an Open-Vocabulary Spatio-Tempora
l Video Grounding task. Unlike prevalent closed-set approaches that struggle wit
h open-vocabulary scenarios due to limited training data and predefined vocabula
ries our model leverages pre-trained representations from foundational spatial g
rounding models. This empowers it to effectively bridge the semantic gap between
 natural language and diverse visual content achieving strong performance in clo
sed-set and open-vocabulary settings. Our contributions include a novel spatio-t
emporal video grounding model surpassing state-of-the-art results in closed-set
evaluations on multiple datasets and demonstrating superior performance in open-
vocabulary scenarios. Notably the proposed model outperforms state-of-the-art me
thods in closed-set settings on VidSTG (Declarative and Interrogative) and HC-ST
VG (V1 and V2) datasets. Furthermore in open-vocabulary evaluations on HC-STVG V
1 and YouCook-Interactions our model surpasses the recent best-performing models
 by 4.88 m_vIoU and 1.83 accuracy demonstrating its efficacy in handling diverse
 linguistic and visual concepts for improved video understanding. Our codes will
 be publicly released.

OmniLocalRF: Omnidirectional Local Radiance Fields from Dynamic Videos
Dongyoung Choi, Hyeonjoong Jang, Min H. Kim; Proceedings of the IEEE/CVF Confere
nce on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 6871-6880
Omnidirectional cameras are extensively used in various applications to provide
a wide field of vision. However they face a challenge in synthesizing novel view

s due to the inevitable presence of dynamic objects including the photographer i
n their wide field of view. In this paper we introduce a new approach called Omn
idirectional Local Radiance Fields (OmniLocalRF) that can render static-only sce
ne views removing and inpainting dynamic objects simultaneously. Our approach co
mbines the principles of local radiance fields with the bidirectional optimizati
on of omnidirectional rays. Our input is an omnidirectional video and we evaluat
e the mutual observations of the entire angle between the previous and current f
rames. To reduce ghosting artifacts of dynamic objects and inpaint occlusions we
 devise a multi-resolution motion mask prediction module. Unlike existing method
s that primarily separate dynamic components through the temporal domain our met
hod uses multi-resolution neural feature planes for precise segmentation which i
s more suitable for long 360-degree videos. Our experiments validate that OmniLo
calRF outperforms existing methods in both qualitative and quantitative metrics
especially in scenarios with complex real-world scenes. In particular our approa
ch eliminates the need for manual interaction such as drawing motion masks by ha
nd and additional pose estimation making it a highly effective and efficient sol
ution.

LoS: Local Structure-Guided Stereo Matching
Kunhong Li, Longguang Wang, Ye Zhang, Kaiwen Xue, Shunbo Zhou, Yulan Guo; Procee
dings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVP
R), 2024, pp. 19746-19756
Estimating disparities in challenging areas is difficult and limits the performa
nce of stereo matching models. In this paper we exploit local structure informat
ion (LSI) to enhance stereo matching. Specifically our LSI comprises a series of
 key elements including the slant plane (parameterised by disparity gradients) d
isparity offset details and neighbouring relations. This LSI empowers our method
 to effectively handle intricate structures including object boundaries and curv
ed surfaces. We bootstrap the LSI from monocular depth and subsequently iterativ
ely refine it to better capture the underlying scene geometry constraints. Build
ing upon the LSI we introduce the Local Structure-Guided Propagation (LSGP) whic
h enhances the disparity initialization optimization and refinement processes. B
y combining LSGP with a Gated Recurrent Unit (GRU) we present our novel stereo m
atching method referred to as Local Structure-guided stereo matching (LoS). Rema
rkably LoS achieves top-ranking results on four widely recognized public benchma
rk datasets (ETH3D Middlebury KITTI 15 & 12) demonstrating the superior capabili
ties of our proposed model.

Semantic Human Mesh Reconstruction with Textures
Xiaoyu Zhan, Jianxin Yang, Yuanqi Li, Jie Guo, Yanwen Guo, Wenping Wang; Proceed
ings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR
), 2024, pp. 142-152
The field of 3D detailed human mesh reconstruction has made significant progress
 in recent years. However current methods still face challenges when used in ind
ustrial applications due to unstable results low-quality meshes and a lack of UV
 unwrapping and skinning weights. In this paper we present SHERT a novel pipelin
e that can reconstruct semantic human meshes with textures and high-precision de
tails. SHERT applies semantic- and normal-based sampling between the detailed su
rface (e.g. mesh and SDF) and the corresponding SMPL-X model to obtain a partial
ly sampled semantic mesh and then generates the complete semantic mesh by our sp
ecifically designed self-supervised completion and refinement networks. Using th
e complete semantic mesh as a basis we employ a texture diffusion model to creat
e human textures that are driven by both images and texts. Our reconstructed mes
hes have stable UV unwrapping high-quality triangle meshes and consistent semant
ic information. The given SMPL-X model provides semantic information and shape p
riors allowing SHERT to perform well even with incorrect and incomplete inputs.
The semantic information also makes it easy to substitute and animate different
body parts such as the face body and hands. Quantitative and qualitative experim
ents demonstrate that SHERT is capable of producing high-fidelity and robust sem
antic meshes that outperform state-of-the-art methods.

Think Twice Before Selection: Federated Evidential Active Learning for Medical Image Analysis with Domain Shifts

Jiayi Chen, Benteng Ma, Hengfei Cui, Yong Xia; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 11439-11449

Federated learning facilitates the collaborative learning of a global model across multiple distributed medical institutions without centralizing data. Nevertheless the expensive cost of annotation on local clients remains an obstacle to effectively utilizing local data. To mitigate this issue federated active learning methods suggest leveraging local and global model predictions to select a relatively small amount of informative local data for annotation. However existing methods mainly focus on all local data sampled from the same domain making them unreliable in realistic medical scenarios with domain shifts among different clients. In this paper we make the first attempt to assess the informativeness of local data derived from diverse domains and propose a novel methodology termed Federated Evidential Active Learning (FEAL) to calibrate the data evaluation under domain shift. Specifically we introduce a Dirichlet prior distribution in both local and global models to treat the prediction as a distribution over the probability simplex and capture both aleatoric and epistemic uncertainties by using the Dirichlet-based evidential model. Then we employ the epistemic uncertainty to calibrate the aleatoric uncertainty. Afterward we design a diversity relaxation strategy to reduce data redundancy and maintain data diversity. Extensive experiments and analysis on five real multi-center medical image datasets demonstrate the superiority of FEAL over the state-of-the-art active learning methods in federated scenarios with domain shifts. The code will be available at https://github.com/JiayiChen815/FEAL.

Probing the 3D Awareness of Visual Foundation Models

Mohamed El Banani, Amit Raj, Kevis-Kokitsi Maninis, Abhishek Kar, Yuanzhen Li, Michael Rubinstein, Deqing Sun, Leonidas Guibas, Justin Johnson, Varun Jampani; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 21795-21806

Recent advances in large-scale pretraining have yielded visual foundation models with strong capabilities. Not only can recent models generalize to arbitrary images for their training task their intermediate representations are useful for other visual tasks such as detection and segmentation. Given that such models can classify delineate and localize objects in 2D we ask whether they also represent their 3D structure? In this work we analyze the 3D awareness of visual foundation models. We posit that 3D awareness implies that representations (1) encode the 3D structure of the scene and (2) consistently represent the surface across views. We conduct a series of experiments using task-specific probes and zero-shot inference procedures on frozen features. Our experiments reveal several limitations of the current models. Our code and analysis can be found at https://github.com/mbanani/probe3d.

PIA: Your Personalized Image Animator via Plug-and-Play Modules in Text-to-Image Models

Yiming Zhang, Zhening Xing, Yanhong Zeng, Youqing Fang, Kai Chen; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 7747-7756

Recent advancements in personalized text-to-image (T2I) models have revolutionized content creation empowering non-experts to generate stunning images with unique styles. While promising animating these personalized images with realistic motions poses significant challenges in preserving distinct styles high-fidelity details and achieving motion controllability by text. In this paper we present PIA a Personalized Image Animator that excels in aligning with condition images achieving motion controllability by text and the compatibility with various personalized T2I models without specific tuning. To achieve these goals PIA builds upon a base T2I model with well-trained temporal alignment layers allowing for the seamless transformation of any personalized T2I model into an image animation mo

del. A key component of PIA is the introduction of the condition module which ta
kes as inputs the condition frame and inter-frame affinity. This module leverage
s the affinity hint to transfer appearance information from the condition frame
to individual frames in the latent space. This design mitigates the challenges o
f appearance-related frame alignment within PIA and allows for a stronger focus
on aligning with motion-related guidance. To address the lack of a benchmark for
 this field we introduce AnimateBench a comprehensive benchmark comprising diver
se personalized T2I models curated images and motion-related prompts. We show ex
tensive evaluations and applications on AnimateBench to verify the superiority o
f PIA.

When Visual Grounding Meets Gigapixel-level Large-scale Scenes: Benchmark and Ap
proach
Tao Ma, Bing Bai, Haozhe Lin, Heyuan Wang, Yu Wang, Lin Luo, Lu Fang; Proceeding
s of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR),
2024, pp. 22119-22128
Visual grounding refers to the process of associating natural language expressio
ns with corresponding regions within an image. Existing benchmarks for visual gr
ounding primarily operate within small-scale scenes with a few objects. Neverthe
less recent advances in imaging technology have enabled the acquisition of gigap
ixel-level images providing high-resolution details in large-scale scenes contai
ning numerous objects. To bridge this gap between imaging and computer vision be
nchmarks and make grounding more practically valuable we introduce a novel datas
et named GigaGrounding designed to challenge visual grounding models in gigapixe
l-level large-scale scenes. We extensively analyze and compare the dataset with
existing benchmarks demonstrating that GigaGrounding presents unique challenges
such as large-scale scene understanding gigapixel-level resolution significant v
ariations in object scales and the "multi-hop expressions". Furthermore we intro
duced a simple yet effective grounding approach which employs a "glance-to-zoom-
in" paradigm and exhibits enhanced capabilities for addressing the GigaGrounding
 task. The dataset is available at www.gigavision.ai.

NeRF Analogies: Example-Based Visual Attribute Transfer for NeRFs
Michael Fischer, Zhengqin Li, Thu Nguyen-Phuoc, Aljaz Bozic, Zhao Dong, Carl Mar
shall, Tobias Ritschel; Proceedings of the IEEE/CVF Conference on Computer Visio
n and Pattern Recognition (CVPR), 2024, pp. 4640-4650
A Neural Radiance Field (NeRF) encodes the specific relation of 3D geometry and
appearance of a scene. We here ask the question whether we can transfer the appe
arance from a source NeRF onto a target 3D geometry in a semantically meaningful
 way such that the resulting new NeRF retains the target geometry but has an app
earance that is an analogy to the source NeRF. To this end we generalize classic
 image analogies from 2D images to NeRFs. We leverage correspondence transfer al
ong semantic affinity that is driven by semantic features from large pre-trained
 2D image models to achieve multi-view consistent appearance transfer. Our metho
d allows exploring the mix-and-match product space of 3D geometry and appearance
. We show that our method outperforms traditional stylization-based methods and
that a large majority of users prefer our method over several typical baselines.

Mind Artist: Creating Artistic Snapshots with Human Thought
Jiaxuan Chen, Yu Qi, Yueming Wang, Gang Pan; Proceedings of the IEEE/CVF Confere
nce on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 27207-27217
We introduce Mind Artist (MindArt) a novel and efficient neural decoding archite
cture to snap artistic photographs from our mind in a controllable manner. Recen
tly progress has been made in image reconstruction with non-invasive brain recor
dings but it's still difficult to generate realistic images with high semantic f
idelity due to the scarcity of data annotations. Unlike previous methods this wo
rk casts the neural decoding into optimal transport (OT) and representation deco
upling problems. Specifically under discrete OT theory we design a graph matchin
g-guided neural representation learning framework to seek the underlying corresp

ondences between conceptual semantics and neural signals which yields a natural and meaningful self-supervisory task. Moreover the proposed MindArt structured with multiple stand-alone modal branches enables the seamless incorporation of semantic representation into any visual style information thus leaving it to have multi-modal reconstruction and training-free semantic editing capabilities. By doing so the reconstructed images of MindArt have phenomenal realism both in terms of semantics and appearance. We compare our MindArt with leading alternatives and achieve SOTA performance in different decoding tasks. Importantly our approach can directly generate a series of stylized "mind snapshots" w/o extra optimizations which may open up more potential applications. Code is available at https://github.com/JxuanC/MindArt.

ViTamin: Designing Scalable Vision Models in the Vision-Language Era
Jieneng Chen, Qihang Yu, Xiaohui Shen, Alan Yuille, Liang-Chieh Chen; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 12954-12966
Recent breakthroughs in vision-language models (VLMs) start a new page in the vision community. The VLMs provide stronger and more generalizable feature embeddings compared to those from ImageNet-pretrained models thanks to the training on the large-scale Internet image-text pairs. However despite the amazing achievement from the VLMs vanilla Vision Transformers (ViTs) remain the default choice for the image encoder. Although pure transformer proves its effectiveness in the text encoding area it remains questionable whether it is also the case for image encoding especially considering that various types of networks are proposed on the ImageNet benchmark which unfortunately are rarely studied in VLMs. Due to small data/model scale the original conclusions of model design on ImageNet can be limited and biased. In this paper we aim at building an evaluation protocol of vision models in the vision-language era under the contrastive language-image pretraining (CLIP) framework. We provide a comprehensive way to benchmark different vision models covering their zero-shot performance and scalability in both model and training data sizes. To this end we introduce ViTamin a new vision models tailored for VLMs. ViTamin-L significantly outperforms ViT-L by 2.0% ImageNet zero-shot accuracy when using the same publicly available DataComp-1B dataset and the same OpenCLIP training scheme. ViTamin-L presents promising results on 60 diverse benchmarks including classification retrieval open-vocabulary detection and segmentation and large multi-modal models. When further scaling up the model size our ViTamin-XL with only 436M parameters attains 82.9% ImageNet zero-shot accuracy surpassing 82.0% achieved by EVA-E that has ten times more parameters (4.4B).

Accept the Modality Gap: An Exploration in the Hyperbolic Space
Sameera Ramasinghe, Violetta Shevchenko, Gil Avraham, Ajanthan Thalaiyasingam; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 27263-27272
Recent advancements in machine learning have spotlighted the potential of hyperbolic spaces as they effectively learn hierarchical feature representations. While there has been progress in leveraging hyperbolic spaces in single-modality contexts its exploration in multimodal settings remains under explored. Some recent efforts have sought to transpose Euclidean multimodal learning techniques to hyperbolic spaces by adopting geodesic distance based contrastive losses. However we show both theoretically and empirically that such spatial proximity based contrastive loss significantly disrupts hierarchies in the latent space. To remedy this we advocate that the cross-modal representations should accept the inherent modality gap between text and images and introduce a novel approach to measure cross-modal similarity that does not enforce spatial proximity. Our approach show remarkable capabilities in preserving unimodal hierarchies while aligning the two modalities. Our experiments on a series of downstream tasks demonstrate that better latent structure emerges with our objective function while being superior in text-to-image and image-to-text retrieval tasks.

Unraveling Instance Associations: A Closer Look for Audio-Visual Segmentation
Yuanhong Chen, Yuyuan Liu, Hu Wang, Fengbei Liu, Chong Wang, Helen Frazer, Gustavo Carneiro; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 26497-26507
Audio-visual segmentation (AVS) is a challenging task that involves accurately segmenting sounding objects based on audio-visual cues. The effectiveness of audio-visual learning critically depends on achieving accurate cross-modal alignment between sound and visual objects. Successful audio-visual learning requires two essential components: 1) a challenging dataset with high-quality pixel-level multi-class annotated images associated with audio files and 2) a model that can establish strong links between audio information and its corresponding visual object. However these requirements are only partially addressed by current methods with training sets containing biased audio-visual data and models that generalise poorly beyond this biased training set. In this work we propose a new cost-effective strategy to build challenging and relatively unbiased high-quality audio-visual segmentation benchmarks. We also propose a new informative sample mining method for audio-visual supervised contrastive learning to leverage discriminative contrastive samples to enforce cross-modal understanding. We show empirical results that demonstrate the effectiveness of our benchmark. Furthermore experiments conducted on existing AVS datasets and on our new benchmark show that our method achieves state-of-the-art (SOTA) segmentation accuracy.
****
Few-Shot Object Detection with Foundation Models
Guangxing Han, Ser-Nam Lim; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 28608-28618
Few-shot object detection (FSOD) aims to detect objects with only a few training examples. Visual feature extraction and query-support similarity learning are the two critical components. Existing works are usually developed based on ImageNet pre-trained vision backbones and design sophisticated metric-learning networks for few-shot learning but still have inferior accuracy. In this work we study few-shot object detection using modern foundation models. First vision-only contrastive pre-trained DINOv2 model is used for the vision backbone which shows strong transferable performance without tuning the parameters. Second Large Language Model (LLM) is employed for contextualized few-shot learning with the input of all classes and query image proposals. Language instructions are carefully designed to prompt the LLM to classify each proposal in context. The contextual information include proposal-proposal relations proposal-class relations and class-class relations which can largely promote few-shot learning. We comprehensively evaluate the proposed model (FM-FSOD) in multiple FSOD benchmarks achieving state-of-the-arts performance.

FedMef: Towards Memory-efficient Federated Dynamic Pruning
Hong Huang, Weiming Zhuang, Chen Chen, Lingjuan Lyu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 27548-27557
Federated learning (FL) promotes decentralized training while prioritizing data confidentiality. However its application on resource-constrained devices is challenging due to the high demand for computation and memory resources to train deep learning models. Neural network pruning techniques such as dynamic pruning could enhance model efficiency but directly adopting them in FL still poses substantial challenges including post-pruning performance degradation high activation memory usage etc. To address these challenges we propose FedMef a novel and memory-efficient federated dynamic pruning framework. FedMef comprises two key components. First we introduce the budget-aware extrusion that maintains pruning efficiency while preserving post-pruning performance by salvaging crucial information from parameters marked for pruning within a given budget. Second we propose scaled activation pruning to effectively reduce activation memory footprints which is particularly beneficial for deploying FL to memory-limited devices. Extensive experiments demonstrate the effectiveness of our proposed FedMef. In particular it achieves a significant reduction of 28.5% in memory footprint compared to st

ate-of-the-art methods while obtaining superior accuracy.
****
Seeing the Unseen: Visual Common Sense for Semantic Placement
Ram Ramrakhya, Aniruddha Kembhavi, Dhruv Batra, Zsolt Kira, Kuo-Hao Zeng, Luca Weihs; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 16273-16283
Computer vision tasks typically involve describing what is visible in an image (e.g. classification detection segmentation and captioning). We study a visual common sense task that requires understanding 'what is not visible'. Specifically given an image (e.g. of a living room) and a name of an object ("cushion") a vision system is asked to predict semantically-meaningful regions (masks or bounding boxes) in the image where that object could be placed or is likely be placed by humans (e.g. on the sofa). We call this task: Semantic Placement (SP) and believe that such common-sense visual understanding is critical for assitive robots (tidying a house) AR devices (automatically rendering an object in the user's space) and visually-grounded chatbots with common sense. Studying the invisible is hard. Datasets for image description are typically constructed by curating relevant images (e.g. via image search with object names) and asking humans to annotate the contents of the image; neither of those two steps are straightforward for objects not present in the image. We overcome this challenge by operating in the opposite direction: we start with an image of an object in context (which is easy to find online) and remove that object from the image via inpainting. This automated pipeline converts unstructured web data into a paired with/without object dataset. With this proposed data generation pipeline we collect a novel dataset containing 1.3M images across 9 object categories. We then train a SP prediction model called CLIP-UNet on our dataset. The CLIP-UNet outperforms existing VLMs and baselines that combine semantic priors with object detectors generalizes well to real-world and simulated images exhibits semantics-aware reasoning for object placement and enables downstream applications like tidying robots in indoor environments.

Texture-Preserving Diffusion Models for High-Fidelity Virtual Try-On
Xu Yang, Changxing Ding, Zhibin Hong, Junhao Huang, Jin Tao, Xiangmin Xu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 7017-7026
Image-based virtual try-on is an increasingly important task for online shopping. It aims to synthesize images of a specific person wearing a specified garment. Diffusion model-based approaches have recently become popular as they are excellent at image synthesis tasks. However these approaches usually employ additional image encoders and rely on the cross-attention mechanism for texture transfer from the garment to the person image which affects the try-on's efficiency and fidelity. To address these issues we propose an Texture-Preserving Diffusion (TPD) model for virtual try-on which enhances the fidelity of the results and introduces no additional image encoders. Accordingly we make contributions from two aspects. First we propose to concatenate the masked person and reference garment images along the spatial dimension and utilize the resulting image as the input for the diffusion model's denoising UNet. This enables the original self-attention layers contained in the diffusion model to achieve efficient and accurate texture transfer. Second we propose a novel diffusion-based method that predicts a precise inpainting mask based on the person and reference garment images further enhancing the reliability of the try-on results. In addition we integrate mask prediction and image synthesis into a single compact model. The experimental results show that our approach can be applied to various try-on tasks e.g. garment-to-person and person-to-person try-ons and significantly outperforms state-of-the-art methods on popular VITON VITON-HD databases. Code is available at https://github.com/Gal4way/TPD.

PracticalDG: Perturbation Distillation on Vision-Language Models for Hybrid Domain Generalization
Zining Chen, Weiqiu Wang, Zhicheng Zhao, Fei Su, Aidong Men, Hongying Meng; Proc

eedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (C
VPR), 2024, pp. 23501-23511
Domain Generalization (DG) aims to resolve distribution shifts between source an
d target domains and current DG methods are default to the setting that data fro
m source and target domains share identical categories. Nevertheless there exist
s unseen classes from target domains in practical scenarios. To address this iss
ue Open Set Domain Generalization (OSDG) has emerged and several methods have be
en exclusively proposed. However most existing methods adopt complex architectur
es with slight improvement compared with DG methods. Recently vision-language mo
dels (VLMs) have been introduced in DG following the fine-tuning paradigm but co
nsume huge training overhead with large vision models. Therefore in this paper w
e innovate to transfer knowledge from VLMs to lightweight vision models and impr
ove the robustness by introducing Perturbation Distillation (PD) from three pers
pectives including Score Class and Instance (SCI) named SCI-PD. Moreover previou
s methods are oriented by the benchmarks with identical and fixed splits ignorin
g the divergence between source domains. These methods are revealed to suffer fr
om sharp performance decay with our proposed new benchmark Hybrid Domain General
ization (HDG) and a novel metric H^ 2 -CV which construct various splits to comp
rehensively assess the robustness of algorithms. Extensive experiments demonstra
te that our method outperforms state-of-the-art algorithms on multiple datasets
especially improving the robustness when confronting data scarcity.

SODA: Bottleneck Diffusion Models for Representation Learning
Drew A. Hudson, Daniel Zoran, Mateusz Malinowski, Andrew K. Lampinen, Andrew Jae
gle, James L. McClelland, Loic Matthey, Felix Hill, Alexander Lerchner; Proceedi
ngs of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR)
, 2024, pp. 23115-23127
We introduce SODA a self-supervised diffusion model designed for representation
learning. The model incorporates an image encoder which distills a source view i
nto a compact representation that in turn guides the generation of related novel
 views. We show that by imposing a tight bottleneck between the encoder and a de
noising decoder and leveraging novel view synthesis as a self-supervised objecti
ve we can turn diffusion models into strong representation learners capable of c
apturing visual semantics in an unsupervised manner. To the best of our knowledg
e SODA is the first diffusion model to succeed at ImageNet linear-probe classifi
cation and at the same time it accomplishes reconstruction editing and synthesis
 tasks across a wide range of datasets. Further investigation reveals the disent
angled nature of its emergent latent space that serves as an effective interface
 to control and manipulate the produced images. All in all we aim to shed light
on the exciting and promising potential of diffusion models not only for image g
eneration but also for learning rich and robust representations. See our website
 at soda-diffusion.github.io.

Towards Robust Event-guided Low-Light Image Enhancement: A Large-Scale Real-Worl
d Event-Image Dataset and Novel Approach
Guoqiang Liang, Kanghao Chen, Hangyu Li, Yunfan Lu, Lin Wang; Proceedings of the
 IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp
. 23-33
Event camera has recently received much attention for low-light image enhancemen
t (LIE) thanks to their distinct advantages such as high dynamic range. However
current research is prohibitively restricted by the lack of large-scale real-wor
ld and spatial-temporally aligned event-image datasets. To this end we propose a
 real-world (indoor and outdoor) dataset comprising over 30K pairs of images and
 events under both low and normal illumination conditions. To achieve this we ut
ilize a robotic arm that traces a consistent non-linear trajectory to curate the
 dataset with spatial alignment precision under 0.03mm. We then introduce a matc
hing alignment strategy rendering 90% of our dataset with errors less than 0.01s
. Based on the dataset we propose a novel event-guided LIE approach called EvLig
ht towards robust performance in real-world low-light scenes. Specifically we fi
rst design the multi-scale holistic fusion branch to extract holistic structural

and textural information from both events and images. To ensure robustness agai
nst variations in the regional illumination and noise we then introduce a Signal
-to-Noise-Ratio (SNR)-guided regional feature selection to selectively fuse feat
ures of images from regions with high SNR and enhance those with low SNR by extr
acting regional structural information from events. our EvLight significantly su
rpasses the frame-based methods e.g. Retinexformer by 1.14 dB and 2.62 dB respec
tively. Code and datasets are available at https://vlislab22.github.io/eg-lowlig
ht/.

Zero-Reference Low-Light Enhancement via Physical Quadruple Priors
Wenjing Wang, Huan Yang, Jianlong Fu, Jiaying Liu; Proceedings of the IEEE/CVF C
onference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 26057-260
66
Understanding illumination and reducing the need for supervision pose a signific
ant challenge in low-light enhancement. Current approaches are highly sensitive
to data usage during training and illumination-specific hyper-parameters limitin
g their ability to handle unseen scenarios. In this paper we propose a new zero-
reference low-light enhancement framework trainable solely with normal light ima
ges. To accomplish this we devise an illumination-invariant prior inspired by th
e theory of physical light transfer. This prior serves as the bridge between nor
mal and low-light images. Then we develop a prior-to-image framework trained wit
hout low-light data. During testing this framework is able to restore our illumi
nation-invariant prior back to images automatically achieving low-light enhancem
ent. Within this framework we leverage a pretrained generative diffusion model f
or model ability introduce a bypass decoder to handle detail distortion as well
as offer a lightweight version for practicality. Extensive experiments demonstra
te our framework's superiority in various scenarios as well as good interpretabi
lity robustness and efficiency. Code is available on our project homepage: http:
//daooshee.github.io/QuadPrior-Website/

LLaMA-Excitor: General Instruction Tuning via Indirect Feature Interaction
Bo Zou, Chao Yang, Yu Qiao, Chengbin Quan, Youjian Zhao; Proceedings of the IEEE
/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 140
89-14099
Existing methods to fine-tune LLMs like Adapter Prefix-tuning and LoRA which int
roduce extra modules or additional input sequences to inject new skills or knowl
edge may compromise the innate abilities of LLMs. In this paper we propose LLaMA
-Excitor a lightweight method that stimulates the LLMs' potential to better foll
ow instructions by gradually paying more attention to worthwhile information. Sp
ecifically the LLaMA-Excitor does not directly change the intermediate hidden st
ate during the self-attention calculation of the transformer structure. We desig
ned the Excitor block as a bypass module for the similarity score computation in
 LLMs' self-attention to reconstruct keys and change the importance of values by
 learnable prompts. LLaMA-Excitor ensures a self-adaptive allocation of addition
al attention to input instructions thus effectively preserving LLMs' pre-trained
 knowledge when fine-tuning LLMs on low-quality instruction-following datasets.
Furthermore we unify the modeling of multi-modal tuning and language-only tuning
 extending LLaMA-Excitor to a powerful visual instruction follower without the n
eed for complex multi-modal alignment. Our proposed approach is evaluated in lan
guage-only and multi-modal tuning experimental scenarios. Notably LLaMA-Excitor
is the only method that maintains basic capabilities while achieving a significa
nt improvement (+6%) on the MMLU benchmark. In the visual instruction tuning we
achieve a new state-of-the-art image captioning performance of 157.5 CIDEr on MS
COCO and a comparable performance (88.39%) on ScienceQA to cutting-edge models w
ith more parameters and extensive vision-language pertaining.

NeRFCodec: Neural Feature Compression Meets Neural Radiance Fields for Memory-Ef
ficient Scene Representation
Sicheng Li, Hao Li, Yiyi Liao, Lu Yu; Proceedings of the IEEE/CVF Conference on
Computer Vision and Pattern Recognition (CVPR), 2024, pp. 21274-21283

The emergence of Neural Radiance Fields (NeRF) has greatly impacted 3D scene mod
eling and novel-view synthesis. As a kind of visual media for 3D scene represent
ation compression with high rate-distortion performance is an eternal target. Mo
tivated by advances in neural compression and neural field representation we pro
pose NeRFCodec an end-to-end NeRF compression framework that integrates non-line
ar transform quantization and entropy coding for memory-efficient scene represen
tation. Since training a non-linear transform directly on a large scale of NeRF
feature planes is impractical we discover that pre-trained neural 2D image codec
 can be utilized for compressing the features when adding content-specific param
eters. Specifically we reuse neural 2D image codec but modify its encoder and de
coder heads while keeping the other parts of the pre-trained decoder frozen. Thi
s allows us to train the full pipeline via supervision of rendering loss and ent
ropy loss yielding the rate-distortion balance by updating the content-specific
parameters. At test time the bitstreams containing latent code feature decoder h
ead and other side information are transmitted for communication. Experimental r
esults demonstrate our method outperforms existing NeRF compression methods enab
ling high-quality novel view synthesis with a memory budget of 0.5 MB.

From a Bird's Eye View to See: Joint Camera and Subject Registration without the
 Camera Calibration
Zekun Qian, Ruize Han, Wei Feng, Song Wang; Proceedings of the IEEE/CVF Conferen
ce on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 863-873
We tackle a new problem of multi-view camera and subject registration in the bir
d's eye view (BEV) without pre-given camera calibration which promotes the multi
-view subject registration problem to a new calibration-free stage. This greatly
 alleviates the limitation in many practical applications. However this is a ver
y challenging problem since its only input is several RGB images from different
first-person views (FPVs) without the BEV image and the calibration of the FPVs
while the output is a unified plane aggregated from all views with the positions
 and orientations of both the subjects and cameras in a BEV. For this purpose we
 propose an end-to-end framework solving camera and subject registration togethe
r by taking advantage of their mutual dependence whose main idea is as below: i)
 creating a subject view-transform module (VTM) to project each pedestrian from
FPV to a virtual BEV ii) deriving a multi-view geometry-based spatial alignment
module (SAM) to estimate the relative camera pose in a unified BEV iii) selectin
g and refining the subject and camera registration results within the unified BE
V. We collect a new large-scale synthetic dataset with rich annotations for trai
ning and evaluation. Additionally we also collect a real dataset for cross-domai
n evaluation. The experimental results show the remarkable effectiveness of our
method. The code and proposed datasets are available at https://github.com/zekun
qian/BEVSee.

Steerers: A Framework for Rotation Equivariant Keypoint Descriptors
Georg Bökman, Johan Edstedt, Michael Felsberg, Fredrik Kahl; Proceedings of the
IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp.
 4885-4895
Image keypoint descriptions that are discriminative and matchable over large cha
nges in viewpoint are vital for 3D reconstruction. However descriptions output b
y learned descriptors are typically not robust to camera rotation. While they ca
n be made more robust by e.g. data aug-mentation this degrades performance on up
right images. Another approach is test-time augmentation which incurs a signific
ant increase in runtime. Instead we learn a lin-ear transform in description spa
ce that encodes rotations of the input image. We call this linear transform a st
eerer since it allows us to transform the descriptions as if the im-age was rota
ted. From representation theory we know all possible steerers for the rotation g
roup. Steerers can be optimized (A) given a fixed descriptor (B) jointly with a
de-scriptor or (C) we can optimize a descriptor given a fixed steerer. We perfor
m experiments in these three settings and obtain state-of-the-art results on the
 rotation invariant im-age matching benchmarks AIMS and Roto-360.

Efficient Dataset Distillation via Minimax Diffusion
Jianyang Gu, Saeed Vahidian, Vyacheslav Kungurtsev, Haonan Wang, Wei Jiang, Yang You, Yiran Chen; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 15793-15803
Dataset distillation reduces the storage and computational consumption of training a network by generating a small surrogate dataset that encapsulates rich information of the original large-scale one. However previous distillation methods heavily rely on the sample-wise iterative optimization scheme. As the images-per-class (IPC) setting or image resolution grows larger the necessary computation will demand overwhelming time and resources. In this work we intend to incorporate generative diffusion techniques for computing the surrogate dataset. Observing that key factors for constructing an effective surrogate dataset are representativeness and diversity we design additional minimax criteria in the generative training to enhance these facets for the generated images of diffusion models. We present a theoretical model of the process as hierarchical diffusion control demonstrating the flexibility of the diffusion process to target these criteria without jeopardizing the faithfulness of the sample to the desired distribution. The proposed method achieves state-of-the-art validation performance while demanding much less computational resources. Under the 100-IPC setting on ImageWoof our method requires less than one-twentieth the distillation time of previous methods yet yields even better performance. Source code and generated data are available in https://github.com/vimar-gu/MinimaxDiffusion.
****
Posterior Distillation Sampling
Juil Koo, Chanho Park, Minhyuk Sung; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 13352-13361
We introduce Posterior Distillation Sampling (PDS) a novel optimization method for parametric image editing based on diffusion models. Existing optimization-based methods which leverage the powerful 2D prior of diffusion models to handle various parametric images have mainly focused on generation. Unlike generation editing requires a balance between conforming to the target attribute and preserving the identity of the source content. Recent 2D image editing methods have achieved this balance by leveraging the stochastic latent encoded in the generative process of diffusion models. To extend the editing capabilities of diffusion models shown in pixel space to parameter space we reformulate the 2D image editing method into an optimization form named PDS. PDS matches the stochastic latents of the source and the target enabling the sampling of targets in diverse parameter spaces that align with a desired attribute while maintaining the source's identity. We demonstrate that this optimization resembles running a generative process with the target attribute but aligning this process with the trajectory of the source's generative process. Extensive editing results in Neural Radiance Fields and Scalable Vector Graphics representations demonstrate that PDS is capable of sampling targets to fulfill the aforementioned balance across various parameter spaces.

HOISDF: Constraining 3D Hand-Object Pose Estimation with Global Signed Distance Fields
Haozhe Qi, Chen Zhao, Mathieu Salzmann, Alexander Mathis; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 10392-10402
Human hands are highly articulated and versatile at handling objects. Jointly estimating the 3D poses of a hand and the object it manipulates from a monocular camera is challenging due to frequent occlusions. Thus existing methods often rely on intermediate 3D shape representations to increase performance. These representations are typically explicit such as 3D point clouds or meshes and thus provide information in the direct surroundings of the intermediate hand pose estimate. To address this we introduce HOISDF a Signed Distance Field (SDF) guided hand-object pose estimation network which jointly exploits hand and object SDFs to provide a global implicit representation over the complete reconstruction volume. Specifically the role of the SDFs is threefold: equip the visual encoder with i

mplicit shape information help to encode hand-object interactions and guide the hand and object pose regression via SDF-based sampling and by augmenting the fea ture representations. We show that HOISDF achieves state-of-the-art results on h and-object pose estimation benchmarks (DexYCB and HO3Dv2). Code is available htt ps://github.com/amathislab/HOISDF.
****
Enhancing Video Super-Resolution via Implicit Resampling-based Alignment
Kai Xu, Ziwei Yu, Xin Wang, Michael Bi Mi, Angela Yao; Proceedings of the IEEE/C VF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 2546-2555
In video super-resolution it is common to use a frame-wise alignment to support the propagation of information over time. The role of alignment is well-studied for low-level enhancement in video but existing works overlook a critical step -- resampling. We show through extensive experiments that for alignment to be eff ective the resampling should preserve the reference frequency spectrum while min imizing spatial distortions. However most existing works simply use a default ch oice of bilinear interpolation for resampling even though bilinear interpolation has a smoothing effect and hinders super-resolution. From these observations we propose an implicit resampling-based alignment. The sampling positions are enco ded by a sinusoidal positional encoding while the value is estimated with a coor dinate network and a window-based cross-attention. We show that bilinear interpo lation inherently attenuates high-frequency information while an MLP-based coord inate network can approximate more frequencies. Experiments on synthetic and rea l-world datasets show that alignment with our proposed implicit resampling enhan ces the performance of state-of-the-art frameworks with minimal impact on both c ompute and parameters.

DiffPortrait3D: Controllable Diffusion for Zero-Shot Portrait View Synthesis
Yuming Gu, Hongyi Xu, You Xie, Guoxian Song, Yichun Shi, Di Chang, Jing Yang, Li njie Luo; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 10456-10465
We present DiffPortrait3D a conditional diffusion model that is capable of synth esizing 3D-consistent photo-realistic novel views from as few as a single in-the -wild portrait. Specifically given a single RGB input we aim to synthesize plaus ible but consistent facial details rendered from novel camera views with retaine d both identity and facial expression. In lieu of time-consuming optimization an d fine-tuning our zero-shot method generalizes well to arbitrary face portraits with unposed camera views extreme facial expressions and diverse artistic depict ions. At its core we leverage the generative prior of 2D diffusion models pre-tr ained on large-scale image datasets as our rendering backbone while the denoisin g is guided with disentangled attentive control of appearance and camera pose. T o achieve this we first inject the appearance context from the reference image i nto the self-attention layers of the frozen UNets. The rendering view is then ma nipulated with a novel conditional control module that interprets the camera pos e by watching a condition image of a crossed subject from the same view. Further more we insert a trainable cross-view attention module to enhance view consisten cy which is further strengthened with a novel 3D-aware noise generation process during inference. We demonstrate state-of-the-art results both qualitatively and quantitatively on our challenging in-the-wild and multi-view benchmarks.

Rethinking Transformers Pre-training for Multi-Spectral Satellite Imagery
Mubashir Noman, Muzammal Naseer, Hisham Cholakkal, Rao Muhammad Anwer, Salman Kh an, Fahad Shahbaz Khan; Proceedings of the IEEE/CVF Conference on Computer Visio n and Pattern Recognition (CVPR), 2024, pp. 27811-27819
Recent advances in unsupervised learning have demonstrated the ability of large vision models to achieve promising results on downstream tasks by pre-training o n large amount of unlabelled data. Such pre-training techniques have also been e xplored recently in the remote sensing domain due to the availability of large a mount of unlabelled data. Different from standard natural image datasets remote sensing data is acquired from various sensor technologies and exhibit diverse ra

nge of scale variations as well as modalities. Existing satellite image pre-training methods either ignore the scale information present in the remote sensing imagery or restrict themselves to use only a single type of data modality. In this paper we re-visit transformers pre-training and leverage multi-scale information that is effectively utilized with multiple modalities. Our proposed approach named SatMAE++ performs multi-scale pre-training and utilizes convolution based upsampling blocks to reconstruct the image at higher scales making it extensible to include more scales. Compared to existing works the proposed SatMAE++ with multi-scale pre-training is equally effective for both optical as well as multi-spectral imagery. Extensive experiments on six datasets reveal the merits of proposed contributions leading to state-of-the-art performance on all datasets. SatMAE++ achieves mean average precision (mAP) gain of 2.5% for multi-label classification task on BigEarthNet dataset.
****
LLM4SGG: Large Language Models for Weakly Supervised Scene Graph Generation
Kibum Kim, Kanghoon Yoon, Jaehyeong Jeon, Yeonjun In, Jinyoung Moon, Donghyun Kim, Chanyoung Park; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 28306-28316
Weakly-Supervised Scene Graph Generation (WSSGG) research has recently emerged as an alternative to the fully-supervised approach that heavily relies on costly annotations. In this regard studies on WSSGG have utilized image captions to obtain unlocalized triplets while primarily focusing on grounding the unlocalized triplets over image regions. However they have overlooked the two issues involved in the triplet formation process from the captions: 1) Semantic over-simplification issue arises when extracting triplets from captions where fine-grained predicates in captions are undesirably converted into coarse-grained predicates resulting in a long-tailed predicate distribution and 2) Low-density scene graph issue arises when aligning the triplets in the caption with entity/predicate classes of interest where many triplets are discarded and not used in training leading to insufficient supervision. To tackle the two issues we propose a new approach i.e. Large Language Model for weakly-supervised SGG (LLM4SGG) where we mitigate the two issues by leveraging the LLM's in-depth understanding of language and reasoning ability during the extraction of triplets from captions and alignment of entity/predicate classes with target data. To further engage the LLM in these processes we adopt the idea of Chain-of-Thought and the in-context few-shot learning strategy. To validate the effectiveness of LLM4SGG we conduct extensive experiments on Visual Genome and GQA datasets showing significant improvements in both Recall@K and mean Recall@K compared to the state-of-the-art WSSGG methods. A further appeal is that LLM4SGG is data-efficient enabling effective model training with a small amount of training images.

Parameter Efficient Fine-tuning via Cross Block Orchestration for Segment Anything Model
Zelin Peng, Zhengqin Xu, Zhilin Zeng, Lingxi Xie, Qi Tian, Wei Shen; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 3743-3752
Parameter-efficient fine-tuning (PEFT) is an effective methodology to unleash the potential of large foundation models in novel scenarios with limited training data. In the computer vision community PEFT has shown effectiveness in image classification but little research has studied its ability for image segmentation. Fine-tuning segmentation models usually require a heavier adjustment of parameters to align the proper projection directions in the parameter space for new scenarios. This raises a challenge to existing PEFT algorithms as they often inject a limited number of individual parameters into each block which prevents substantial adjustment of the projection direction of the parameter space due to the limitation of Hidden Markov Chain along blocks. In this paper we equip PEFT with a cross-block orchestration mechanism to enable the adaptation of the Segment Anything Model (SAM) to various downstream scenarios. We introduce a novel inter-block communication module which integrates a learnable relation matrix to facilitate communication among different coefficient sets of each PEFT block's paramete

r space. Moreover we propose an intra-block enhancement module which introduces a linear projection head whose weights are generated from a hyper-complex layer further enhancing the impact of the adjustment of projection directions on the entire parameter space. Extensive experiments on diverse benchmarks demonstrate that our proposed approach consistently improves the segmentation performance significantly on novel scenarios with only around 1K additional parameters.

Neural Directional Encoding for Efficient and Accurate View-Dependent Appearance Modeling
Liwen Wu, Sai Bi, Zexiang Xu, Fujun Luan, Kai Zhang, Iliyan Georgiev, Kalyan Sunkavalli, Ravi Ramamoorthi; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 21157-21166
Novel-view synthesis of specular objects like shiny metals or glossy paints remains a significant challenge. Not only the glossy appearance but also global illumination effects including reflections of other objects in the environment are critical components to faithfully reproduce a scene. In this paper we present Neural Directional Encoding (NDE) a view-dependent appearance encoding of neural radiance fields (NeRF) for rendering specular objects. NDE transfers the concept of feature-grid-based spatial encoding to the angular domain significantly improving the ability to model high-frequency angular signals. In contrast to previous methods that use encoding functions with only angular input we additionally cone-trace spatial features to obtain a spatially varying directional encoding which addresses the challenging interreflection effects. Extensive experiments on both synthetic and real datasets show that a NeRF model with NDE (1) outperforms the state of the art on view synthesis of specular objects and (2) works with small networks to allow fast (real-time) inference. The source code is available at: https://github.com/lwwu2/nde
****
Masked and Shuffled Blind Spot Denoising for Real-World Images
Hamadi Chihaoui, Paolo Favaro; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 3025-3034
We introduce a novel approach to single image denoising based on the Blind Spot Denoising principle which we call MAsked and SHuffled Blind Spot Denoising (MASH). We focus on the case of correlated noise which often plagues real images. MASH is the result of a careful analysis to determine the relationships between the level of blindness (masking) of the input and the (unknown) noise correlation. Moreover we introduce a shuffling technique to weaken the local correlation of noise which in turn yields an additional denoising performance improvement. We evaluate MASH via extensive experiments on real-world noisy image datasets. We demonstrate state-of-the-art results compared to existing self-supervised denoising methods.

Label Propagation for Zero-shot Classification with Vision-Language Models
Vladan Stojni?, Yannis Kalantidis, Giorgos Tolias; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 23209-23218
Vision-Language Models (VLMs) have demonstrated impressive performance on zero-shot classification i.e. classification when provided merely with a list of class names. In this paper we tackle the case of zero-shot classification in the presence of unlabeled data. We leverage the graph structure of the unlabeled data and introduce ZLaP a method based on label propagation (LP) that utilizes geodesic distances for classification. We tailor LP to graphs containing both text and image features and further propose an efficient method for performing inductive inference based on a dual solution and a sparsification step. We perform extensive experiments to evaluate the effectiveness of our method on 14 common datasets and show that ZLaP outperforms the latest related works. Code: https://github.com/vladan-stojnic/ZLaP

DiffusionAvatars: Deferred Diffusion for High-fidelity 3D Head Avatars
Tobias Kirschstein, Simon Giebenhain, Matthias Nießner; Proceedings of the IEEE/

CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 5481-5492
DiffusionAvatars synthesizes a high-fidelity 3D head avatar of a person offering intuitive control over both pose and expression. We propose a diffusion-based neural renderer that leverages generic 2D priors to produce compelling images of faces. For coarse guidance of the expression and head pose we render a neural parametric head model (NPHM) from the target viewpoint which acts as a proxy geometry of the person. Additionally to enhance the modeling of intricate facial expressions we condition DiffusionAvatars directly on the expression codes obtained from NPHM via cross-attention. Finally to synthesize consistent surface details across different viewpoints and expressions we rig learnable spatial features to the head's surface via TriPlane lookup in NPHM's canonical space. We train DiffusionAvatars on RGB videos and corresponding fitted NPHM meshes of a person and test the obtained avatars in both self-reenactment and animation scenarios. Our experiments demonstrate that DiffusionAvatars generates temporally consistent and visually appealing videos for novel poses and expressions of a person outperforming existing approaches.

Data-Free Quantization via Pseudo-label Filtering
Chunxiao Fan, Ziqi Wang, Dan Guo, Meng Wang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 5589-5598
Quantization for model compression can efficiently reduce the network complexity and storage requirement but the original training data is necessary to remedy the performance loss caused by quantization. The Data-Free Quantization (DFQ) methods have been proposed to handle the absence of original training data with synthetic data. However there are differences between the synthetic and original training data which affects the performance of the quantized network but none of the existing methods considers the differences. In this paper we propose an efficient data-free quantization via pseudo-label filtering which is the first to evaluate the synthetic data before quantization. We design a new metric for evaluating synthetic data using self-entropy which indicates the reliability of synthetic data. The synthetic data can be categorized with the metric into high- and low-reliable datasets for the following training process. Besides the multiple pseudo-labels are designed to label the synthetic data with different reliability which can provide valuable supervision information and avoid misleading training by low-reliable samples. Extensive experiments are implemented on several datasets including CIFAR-10 CIFAR-100 and ImageNet with various models. The experimental results show that our method can perform excellently and outperform existing methods in accuracy.

Revisiting Global Translation Estimation with Feature Tracks
Peilin Tao, Hainan Cui, Mengqi Rong, Shuhan Shen; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 20686-20696
Global translation estimation is a highly challenging step in the global structure from motion (SfM) algorithm. Many existing methods depend solely on relative translations leading to inaccuracies in low parallax scenes and degradation under collinear camera motion. While recent approaches aim to address these issues by incorporating feature tracks into objective functions they are often sensitive to outliers. In this paper we first revisit global translation estimation methods with feature tracks and categorize them into explicit and implicit methods. Then we highlight the superiority of the objective function based on the cross-product distance metric and propose a novel explicit global translation estimation framework that integrates both relative translations and feature tracks as input. To enhance the accuracy of input observations we re-estimate relative translations with the coplanarity constraint of the epipolar plane and propose a simple yet effective strategy to select reliable feature tracks. Finally the effectiveness of our approach is demonstrated through experiments on urban image sequences and unordered Internet images showcasing its superior accuracy and robustness compared to many state-of-the-art techniques.

Open-Set Domain Adaptation for Semantic Segmentation
Seun-An Choe, Ah-Hyung Shin, Keon-Hee Park, Jinwoo Choi, Gyeong-Moon Park; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 23943-23953
Unsupervised domain adaptation (UDA) for semantic segmentation aims to transfer the pixel-wise knowledge from the labeled source domain to the unlabeled target domain. However current UDA methods typically assume a shared label space between source and target limiting their applicability in real-world scenarios where novel categories may emerge in the target domain. In this paper we introduce Open-Set Domain Adaptation for Semantic Segmentation (OSDA-SS) for the first time where the target domain includes unknown classes. We identify two major problems in the OSDA-SS scenario as follows: 1) the existing UDA methods struggle to predict the exact boundary of the unknown classes and 2) they fail to accurately predict the shape of the unknown classes. To address these issues we propose Boundary and Unknown Shape-Aware open-set domain adaptation coined BUS. Our BUS can accurately discern the boundaries between known and unknown classes in a contrastive manner using a novel dilation-erosion-based contrastive loss. In addition we propose OpenReMix a new domain mixing augmentation method that guides our model to effectively learn domain and size-invariant features for improving the shape detection of the known and unknown classes. Through extensive experiments we demonstrate that our proposed BUS effectively detects unknown classes in the challenging OSDA-SS scenario compared to the previous methods by a large margin.

Generative Powers of Ten
Xiaojuan Wang, Janne Kontkanen, Brian Curless, Steven M. Seitz, Ira Kemelmacher-Shlizerman, Ben Mildenhall, Pratul Srinivasan, Dor Verbin, Aleksander Holynski; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 7173-7182
We present a method that uses a text-to-image model to generate consistent content across multiple image scales enabling extreme semantic zooms into a scene e.g. ranging from a wide-angle landscape view of a forest to a macro shot of an insect sitting on one of the tree branches. We achieve this through a joint multi-scale diffusion sampling approach that encourages consistency across different scales while preserving the integrity of each individual sampling process. Since each generated scale is guided by a different text prompt our method enables deeper levels of zoom than traditional super-resolution methods that may struggle to create new contextual structure at vastly different scales. We compare our method qualitatively with alternative techniques in image super-resolution and outpainting and show that our method is most effective at generating consistent multi-scale content.

H-ViT: A Hierarchical Vision Transformer for Deformable Image Registration
Morteza Ghahremani, Mohammad Khateri, Bailiang Jian, Benedikt Wiestler, Ehsan Adeli, Christian Wachinger; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 11513-11523
This paper introduces a novel top-down representation approach for deformable image registration which estimates the deformation field by capturing various short- and long-range flow features at different scale levels. As a Hierarchical Vision Transformer (H-ViT) we propose a dual self-attention and cross-attention mechanism that uses high-level features in the deformation field to represent low-level ones enabling information streams in the deformation field across all voxel patch embeddings irrespective of their spatial proximity. Since high-level features contain abstract flow patterns such patterns are expected to effectively contribute to the representation of the deformation field in lower scales. When the self-attention module utilizes within-scale short-range patterns for representation the cross-attention modules dynamically look for the key tokens across different scales to further interact with the local query voxel patches. Our method shows superior accuracy and visual quality over the state-of-the-art registration methods in five publicly available datasets highlighting a substantial enhanc

ement in the performance of medical imaging registration. The project link is av ailable at https://mogvision.github.io/hvit.

Probing Synergistic High-Order Interaction in Infrared and Visible Image Fusion
Naishan Zheng, Man Zhou, Jie Huang, Junming Hou, Haoying Li, Yuan Xu, Feng Zhao; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recogniti on (CVPR), 2024, pp. 26384-26395
Infrared and visible image fusion aims to generate a fused image by integrating and distinguishing complementary information from multiple sources. While the cr oss-attention mechanism with global spatial interactions appears promising it on ly capture second-order spatial interactions neglecting higher-order interaction s in both spatial and channel dimensions. This limitation hampers the exploitati on of synergies between multi-modalities. To bridge this gap we introduce a Syne rgistic High-order Interaction Paradigm (SHIP) designed to systematically invest igate spatial fine-grained and global statistics collaborations between infrared and visible images across two fundamental dimensions: 1) Spatial dimension: we construct spatial fine-grained interactions through element-wise multiplication mathematically equivalent to global interactions and then foster high-order form ats by iteratively aggregating and evolving complementary information enhancing both efficiency and flexibility. 2) Channel dimension: expanding on channel inte ractions with first-order statistics (mean) we devise high-order channel interac tions to facilitate the discernment of inter-dependencies between source images based on global statistics. Harnessing high-order interactions significantly enh ances our model's ability to exploit multi-modal synergies leading in superior p erformance over state-of-the-art alternatives as shown through comprehensive exp eriments across various benchmarks.

VideoLLM-online: Online Video Large Language Model for Streaming Video
Joya Chen, Zhaoyang Lv, Shiwei Wu, Kevin Qinghong Lin, Chenan Song, Difei Gao, J ia-Wei Liu, Ziteng Gao, Dongxing Mao, Mike Zheng Shou; Proceedings of the IEEE/C VF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 18407 -18418
Large Language Models (LLMs) have been enhanced with vision capabilities enablin g them to comprehend images videos and interleaved vision-language content. Howe ver the learning methods of these large multimodal models (LMMs) typically treat videos as predetermined clips rendering them less effective and efficient at ha ndling streaming video inputs. In this paper we propose a novel Learning-In-Vide

o-Stream (LIVE) framework which enables temporally aligned long-context and real-time dialogue within a continuous video stream. Our LIVE framework comprises comprehensive approaches to achieve video streaming dialogue encompassing: (1) a training objective designed to perform language modeling for continuous streaming inputs (2) a data generation scheme that converts offline temporal annotations into a streaming dialogue format and (3) an optimized inference pipeline to speed up interactive chat in real-world video streams. With our LIVE framework we develop a simplified model called VideoLLM-online and demonstrate its significant advantages in processing streaming videos. For instance our VideoLLM-online-7B model can operate at over 10 FPS on an A100 GPU for a 5-minute video clip from Ego4D narration. Moreover VideoLLM-online also showcases state-of-the-art performance on public offline video benchmarks such as recognition captioning and forecasting. The code model data and demo have been made available at showlab.github.io/videollm-online.

Text-conditional Attribute Alignment across Latent Spaces for 3D Controllable Face Image Synthesis
Feifan Xu, Rui Li, Si Wu, Yong Xu, Hau San Wong; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 9172-9181
With the advent of generative models and vision language pretraining significant improvement has been made in text-driven face manipulation. The text embedding can be used as target supervision for expression control.However it is non-trivial to associate with its 3D attributesi.e. pose and illumination. To address these issues we propose a Text-conditional Attribute aLignment approach for 3D controllable face image synthesis and our model is referred to as TcALign. Specifically since the 3D rendered image can be precisely controlled with the 3D face representation we first propose a Text-conditional 3D Editor to produce the target face representation to realize text-driven manipulation in the 3D space. An attribute embedding space spanned by the target-related attributes embeddings is also introduced to infer the disentangled task-specific direction. Next we train a cross-modal latent mapping network conditioned on the derived difference of 3D representation to infer a correct vector in the latent space of StyleGAN.Thiscorrection vector learning design can accurately transfer the attribute manipulation on 3D images to 2D images. We show that the proposed method delivers more precise text-driven multi-attribute manipulation for 3D controllable face image synthesis. Extensive qualitative and quantitative experiments verify the effectiveness and superiority of our method over the other competing methods.
****
ESCAPE: Encoding Super-keypoints for Category-Agnostic Pose Estimation
Khoi Duc Nguyen, Chen Li, Gim Hee Lee; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 23491-23500
In this paper we tackle the task of category-agnostic pose estimation (CAPE) which aims to predict poses for objects of any category with few annotated samples. Previous works either rely on local matching between features of support and query samples or require support keypoint identifier. The former is prone to overfitting due to its sensitivity to sparse samples while the latter is impractical for the open-world nature of the task. To overcome these limitations we propose ESCAPE - a Bayesian framework that learns a prior over the features of keypoints. The prior can be expressed as a mixture of super-keypoints each being a high-level abstract keypoint that captures the statistics of semantically related keypoints from different categories. We estimate the super-keypoints from base categories and use them in adaptation to novel categories. The adaptation to an unseen category involves two steps: first we match each novel keypoint to a related super-keypoint; and second we transfer the knowledge encoded in the matched super-keypoints to the novel keypoints. For the first step we propose a learnable matching network to capture the relationship between the novel keypoints and the super-keypoints resulting in a more reliable matching. ESCAPE mitigates overfitting by directly transferring learned knowledge to novel categories while it does not use keypoint identifiers. We achieve state-of-the-art performance on the standard MP-100 benchmark.

Correcting Diffusion Generation through Resampling
Yujian Liu, Yang Zhang, Tommi Jaakkola, Shiyu Chang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 8713-8723
Despite diffusion models' superior capabilities in modeling complex distributions there are still non-trivial distributional discrepancies between generated and ground-truth images which has resulted in several notable problems in image generation including missing object errors in text-to-image generation and low image quality. Existing methods that attempt to address these problems mostly do not tend to address the fundamental cause behind these problems which is the distributional discrepancies and hence achieve sub-optimal results. In this paper we propose a particle filtering framework that can effectively address both problems by explicitly reducing the distributional discrepancies. Specifically our method relies on a set of external guidance including a small set of real images and a pre-trained object detector to gauge the distribution gap and then design the resampling weight accordingly to correct the gap. Experiments show that our methods can effectively correct missing object errors and improve image quality in various image generation tasks. Notably our method outperforms the existing strongest baseline by 5% in object occurrence and 1.0 in FID on MS-COCO. Our code is available at https://github.com/UCSB-NLP-Chang/diffusion_resampling.git.

Towards Better Vision-Inspired Vision-Language Models
Yun-Hao Cao, Kaixiang Ji, Ziyuan Huang, Chuanyang Zheng, Jiajia Liu, Jian Wang, Jingdong Chen, Ming Yang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 13537-13547
Vision-language (VL) models have achieved unprecedented success recently in which the connection module is the key to bridge the modality gap. Nevertheless the abundant visual clues are not sufficiently exploited in most existing methods. On the vision side most existing approaches only use the last feature of the vision tower without using the low-level features. On the language side most existing methods only introduce shallow vision-language interactions. In this paper we present a vision-inspired vision-language connection module dubbed as VIVL which efficiently exploits the vision cue for VL models. To take advantage of the lowerlevel information from the vision tower a feature pyramid extractor (FPE) is introduced to combine features from different intermediate layers which enriches the visual cue with negligible parameters and computation overhead. To enhance VL interactions we propose deep vision-conditioned prompts (DVCP) that allows deep interactions of vision and language features efficiently. Our VIVL exceeds the previous state-of-the-art method by 18.1 CIDEr when training from scratch on the COCO caption task which greatly improves the data efficiency. When used as a plug-in module VIVL consistently improves the performance for various backbones and VL frameworks delivering new state-of-the-art results on multiple benchmarks e.g. NoCaps and VQAv2.

VSRD: Instance-Aware Volumetric Silhouette Rendering for Weakly Supervised 3D Object Detection
Zihua Liu, Hiroki Sakuma, Masatoshi Okutomi; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 17354-17363
Monocular 3D object detection poses a significant challenge in 3D scene understanding due to its inherently ill-posed nature in monocular depth estimation. Existing methods heavily rely on supervised learning using abundant 3D labels typically obtained through expensive and labor-intensive annotation on LiDAR point clouds. To tackle this problem we propose a novel weakly supervised 3D object detection framework named VSRD (Volumetric Silhouette Rendering for Detection) to train 3D object detectors without any 3D supervision but only weak 2D supervision. VSRD consists of multi-view 3D auto-labeling and subsequent training of monocular 3D object detectors using the pseudo labels generated in the auto-labeling stage. In the auto-labeling stage we represent the surface of each instance as a signed distance field (SDF) and render its silhouette as an instance mask through

our proposed instance-aware volumetric silhouette rendering. To directly optimiz
e the 3D bounding boxes through rendering we decompose the SDF of each instance
into the SDF of a cuboid and the residual distance field (RDF) that represents t
he residual from the cuboid. This mechanism enables us to optimize the 3D boundi
ng boxes in an end-to-end manner by comparing the rendered instance masks with t
he ground truth instance masks. The optimized 3D bounding boxes serve as effecti
ve training data for 3D object detection. We conduct extensive experiments on th
e KITTI-360 dataset demonstrating that our method outperforms the existing weakl
y supervised 3D object detection methods. The code is available at https://githu
b.com/skmhrk1209/VSRD.

RILA: Reflective and Imaginative Language Agent for Zero-Shot Semantic Audio-Vis
ual Navigation
Zeyuan Yang, Jiageng Liu, Peihao Chen, Anoop Cherian, Tim K. Marks, Jonathan Le
Roux, Chuang Gan; Proceedings of the IEEE/CVF Conference on Computer Vision and
Pattern Recognition (CVPR), 2024, pp. 16251-16261
We leverage Large Language Models (LLM) for zeroshot Semantic Audio Visual Navig
ation (SAVN). Existing methods utilize extensive training demonstrations for rei
nforcement learning yet achieve relatively low success rates and lack generaliza
bility. The intermittent nature of auditory signals further poses additional obs
tacles to inferring the goal information. To address this challenge we present t
he Reflective and Imaginative Language Agent (RILA). By employing multi-modal mo
dels to process sensory data we instruct an LLM-based planner to actively explor
e the environment. During the exploration our agent adaptively evaluates and dis
misses inaccurate perceptual descriptions. Additionally we introduce an auxiliar
y LLMbased assistant to enhance global environmental comprehension by mapping ro
om layouts and providing strategic insights. Through comprehensive experiments a
nd analysis we show that our method outperforms relevant baselines without train
ing demonstrations from the environment and complementary semantic information.

Endow SAM with Keen Eyes: Temporal-spatial Prompt Learning for Video Camouflaged
 Object Detection
Wenjun Hui, Zhenfeng Zhu, Shuai Zheng, Yao Zhao; Proceedings of the IEEE/CVF Con
ference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 19058-19067
The Segment Anything Model (SAM) a prompt-driven foundational model has demonstr
ated remarkable performance in natural image segmentation. However its applicati
on in video camouflaged object detection (VCOD) encounters challenges chiefly st
emming from the overlooked temporal-spatial associations and the unreliability o
f user-provided prompts for camouflaged objects that are difficult to discern wi
th the naked eye. To tackle the above issues we endow SAM with keen eyes and pro
pose the Temporal-spatial Prompt SAM (TSP-SAM) a novel approach tailored for VCO
D via an ingenious prompted learning scheme. Firstly motion-driven self-prompt l
earning is employed to capture the camouflaged object thereby bypassing the need
 for user-provided prompts. With the detected subtle motion cues across consecut
ive video frames the overall movement of the camouflaged object is captured for
more precise spatial localization. Subsequently to eliminate the prompt bias res
ulting from inter-frame discontinuities the long-range consistency within the vi
deo sequences is taken into account to promote the robustness of the self-prompt
s. It is also injected into the encoder of SAM to enhance the representational c
apabilities. Extensive experimental results on two benchmarks demonstrate that t
he proposed TSP-SAM achieves a significant improvement over the state-of-the-art
 methods. With the mIoU metric increasing by 7.8% and 9.6% TSP-SAM emerges as a
groundbreaking step forward in the field of VCOD.

TULIP: Multi-camera 3D Precision Assessment of Parkinson's Disease
Kyungdo Kim, Sihan Lyu, Sneha Mantri, Timothy W. Dunn; Proceedings of the IEEE/C
VF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 22551
-22562
Parkinson's disease (PD) is a devastating movement disorder accelerating in glob
al prevalence but a lack of precision symptom measurement has made the developme

nt of effective therapies challenging. The Unified Parkinson's Disease Rating Scale (UPDRS) is the gold-standard for assessing motor symptom severity yet its manual scoring criteria are vague and subjective resulting in coarse and noisy clinical assessments. Machine learning approaches have the potential to modernize PD symptom assessments by making them more quantitative objective and scalable. However the lack of benchmark video datasets for PD motor exams hinders model development. Here we introduce the TULIP dataset to bridge this gap. TULIP emphasizes precision and comprehensiveness comprising multi-view video recordings (6 cameras) of all 25 UPDRS motor exam components together with ratings by 3 clinical experts in a cohort of Parkinson's patients and healthy controls. The multi-view recordings enable 3D reconstructions of body movement that better capture disease signatures than more conventional 2D methods. Using the dataset we establish a baseline model for predicting UPDRS scores from 3D poses illustrating how existing diagnostics could be automated. Looking ahead TULIP could aid the development of new precision diagnostics that transcend UPDRS scores providing a deeper understanding of PD and its potential treatments.
****
HybridNeRF: Efficient Neural Rendering via Adaptive Volumetric Surfaces
Haithem Turki, Vasu Agrawal, Samuel Rota Bulò, Lorenzo Porzi, Peter Kontschieder, Deva Ramanan, Michael Zollhöfer, Christian Richardt; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 19647-19656
Neural radiance fields provide state-of-the-art view synthesis quality but tend to be slow to render. One reason is that they make use of volume rendering thus requiring many samples (and model queries) per ray at render time. Although this representation is flexible and easy to optimize most real-world objects can be modeled more efficiently with surfaces instead of volumes requiring far fewer samples per ray. This observation has spurred considerable progress in surface representations such as signed distance functions but these may struggle to model semi-opaque and thin structures. We propose a method HybridNeRF that leverages the strengths of both representations by rendering most objects as surfaces while modeling the (typically) small fraction of challenging regions volumetrically. We evaluate HybridNeRF against the challenging Eyeful Tower dataset along with other commonly used view synthesis datasets. When comparing to state-of-the-art baselines including recent rasterization-based approaches we improve error rates by 15-30% while achieving real-time framerates (at least 36 FPS) for virtual-reality resolutions (2K x 2K).
****
AirPlanes: Accurate Plane Estimation via 3D-Consistent Embeddings
Jamie Watson, Filippo Aleotti, Mohamed Sayed, Zawar Qureshi, Oisin Mac Aodha, Gabriel Brostow, Michael Firman, Sara Vicente; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 5270-5280
Extracting planes from a 3D scene is useful for downstream tasks in robotics and augmented reality. In this paper we tackle the problem of estimating the planar surfaces in a scene from posed images. Our first finding is that a surprisingly competitive baseline results from combining popular clustering algorithms with recent improvements in 3D geometry estimation. However such purely geometric methods are understandably oblivious to plane semantics which are crucial to discerning distinct planes. To overcome this limitation we propose a method that predicts multi-view consistent plane embeddings that complement geometry when clustering points into planes. We show through extensive evaluation on the ScanNetV2 dataset that our new method outperforms existing approaches and our strong geometric baseline for the task of plane estimation.
****
Forgery-aware Adaptive Transformer for Generalizable Synthetic Image Detection
Huan Liu, Zichang Tan, Chuangchuang Tan, Yunchao Wei, Jingdong Wang, Yao Zhao; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 10770-10780
In this paper we study the problem of generalizable synthetic image detection aiming to detect forgery images from diverse generative methods e.g. GANs and diff

usion models. Cutting-edge solutions start to explore the benefits of pre-traine
d models and mainly follow the fixed paradigm of solely training an attached cla
ssifier e.g. combining frozen CLIP-ViT with a learnable linear layer in UniFD. H
owever our analysis shows that such a fixed paradigm is prone to yield detectors
 with insufficient learning regarding forgery representations. We attribute the
key challenge to the lack of forgery adaptation and present a novel forgery-awar
e adaptive transformer approach namely FatFormer. Based on the pre-trained visio
n-language spaces of CLIP FatFormer introduces two core designs for the adaption
 to build generalized forgery representations. First motivated by the fact that
both image and frequency analysis are essential for synthetic image detection we
 develop a forgery-aware adapter to adapt image features to discern and integrat
e local forgery traces within image and frequency domains. Second we find that c
onsidering the contrastive objectives between adapted image features and text pr
ompt embeddings a previously overlooked aspect results in a nontrivial generaliz
ation improvement. Accordingly we introduce language-guided alignment to supervi
se the forgery adaptation with image and text prompts in FatFormer. Experiments
show that by coupling these two designs our approach tuned on 4-class ProGAN dat
a attains a remarkable detection performance achieving an average of 98% accurac
y to unseen GANs and surprisingly generalizes to unseen diffusion models with 95
% accuracy.

PostureHMR: Posture Transformation for 3D Human Mesh Recovery
Yu-Pei Song, Xiao Wu, Zhaoquan Yuan, Jian-Jun Qiao, Qiang Peng; Proceedings of t
he IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024,
pp. 9732-9741
Human Mesh Recovery (HMR) aims to estimate the 3D human body from 2D images whic
h is a challenging task due to inherent ambiguities in translating 2D observatio
ns to 3D space. A novel approach called PostureHMR is proposed to leverage a mul
ti-step diffusion-style process which converts this task into a posture transfor
mation from an SMPL T-pose mesh to the target mesh. To inject the learning proce
ss of posture transformation with the physical structure of the human body model
 a kinematics-based forward process is proposed to interpolate the intermediate
state with pose and shape decomposition. Moreover a mesh-to-posture (M2P) decode
r is designed by combining the input of 3D and 2D mesh constraints estimated fro
m the image to model the posture changes in the reverse process. It mitigates th
e difficulties of posture change learning directly from RGB pixels. To overcome
the limitation of pixel-level misalignment of modeling results with the input im
age a new trimap-based rendering loss is designed to highlight the areas with po
or recognition. Experiments conducted on three widely used datasets demonstrate
that the proposed approach outperforms the state-of-the-art methods.
****
Blur2Blur: Blur Conversion for Unsupervised Image Deblurring on Unknown Domains
Bang-Dang Pham, Phong Tran, Anh Tran, Cuong Pham, Rang Nguyen, Minh Hoai; Procee
dings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVP
R), 2024, pp. 2804-2813
This paper presents an innovative framework designed to train an image deblurrin
g algorithm tailored to a specific camera device. This algorithm works by transf
orming a blurry input image which is challenging to deblur into another blurry i
mage that is more amenable to deblurring. The transformation process from one bl
urry state to another leverages unpaired data consisting of sharp and blurry ima
ges captured by the target camera device. Learning this blur-to-blur transformat
ion is inherently simpler than direct blur-to-sharp conversion as it primarily i
nvolves modifying blur patterns rather than the intricate task of reconstructing
 fine image details. The efficacy of the proposed approach has been demonstrated
 through comprehensive experiments on various benchmarks where it significantly
outperforms state-of-the-art methods both quantitatively and qualitatively. Our
code and data are available at https://github.com/VinAIResearch/Blur2Blur

Dynamic Adapter Meets Prompt Tuning: Parameter-Efficient Transfer Learning for P
oint Cloud Analysis

Xin Zhou, Dingkang Liang, Wei Xu, Xingkui Zhu, Yihan Xu, Zhikang Zou, Xiang Bai; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 14707-14717
Point cloud analysis has achieved outstanding performance by transferring point cloud pre-trained models. However existing methods for model adaptation usually update all model parameters i.e. full fine-tuning paradigm which is inefficient as it relies on high computational costs (e.g. training GPU memory) and massive storage space. In this paper we aim to study parameter-efficient transfer learning for point cloud analysis with an ideal trade-off between task performance and parameter efficiency. To achieve this goal we freeze the parameters of the default pre-trained models and then propose the Dynamic Adapter which generates a dynamic scale for each token considering the token significance to the downstream task. We further seamlessly integrate Dynamic Adapter with Prompt Tuning (DAPT) by constructing Internal Prompts capturing the instance-specific features for interaction. Extensive experiments conducted on five challenging datasets demonstrate that the proposed DAPT achieves superior performance compared to the full fine-tuning counterparts while significantly reducing the trainable parameters and training GPU memory by 95% and 35% respectively. Code is available at https://github.com/LMD0311/DAPT.

Exploring Vision Transformers for 3D Human Motion-Language Models with Motion Patches
Qing Yu, Mikihiro Tanaka, Kent Fujiwara; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 937-946
To build a cross-modal latent space between 3D human motion and language acquiring large-scale and high-quality human motion data is crucial. However unlike the abundance of image data the scarcity of motion data has limited the performance of existing motion-language models. To counter this we introduce "motion patches" a new representation of motion sequences and propose using Vision Transformers (ViT) as motion encoders via transfer learning aiming to extract useful knowledge from the image domain and apply it to the motion domain. These motion patches created by dividing and sorting skeleton joints based on body parts in motion sequences are robust to varying skeleton structures and can be regarded as color image patches in ViT. We find that transfer learning with pre-trained weights of ViT obtained through training with 2D image data can boost the performance of motion analysis presenting a promising direction for addressing the issue of limited motion data. Our extensive experiments show that the proposed motion patches used jointly with ViT achieve state-of-the-art performance in the benchmarks of text-to-motion retrieval and other novel challenging tasks such as cross-skeleton recognition zero-shot motion classification and human interaction recognition which are currently impeded by the lack of data.
****
Motion-adaptive Separable Collaborative Filters for Blind Motion Deblurring
Chengxu Liu, Xuan Wang, Xiangyu Xu, Ruhao Tian, Shuai Li, Xueming Qian, Ming-Hsuan Yang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 25595-25605
Eliminating image blur produced by various kinds of motion has been a challenging problem. Dominant approaches rely heavily on model capacity to remove blurring by reconstructing residual from blurry observation in feature space. These practices not only prevent the capture of spatially variable motion in the real world but also ignore the tailored handling of various motions in image space. In this paper we propose a novel real-world deblurring filtering model called the Motion-adaptive Separable Collaborative (MISC) Filter. In particular we use a motion estimation network to capture motion information from neighborhoods thereby adaptively estimating spatially-variant motion flow mask kernels weights and offsets to obtain the MISC Filter. The MISC Filter first aligns the motion-induced blurring patterns to the motion middle along the predicted flow direction and then collaboratively filters the aligned image through the predicted kernels weights and offsets to generate the output. This design can handle more generalized and complex motion in a spatially differentiated manner. Furthermore we analyze the

relationships between the motion estimation network and the residual reconstruction network. Extensive experiments on four widely used benchmarks demonstrate that our method provides an effective solution for real-world motion blur removal and achieves state-of-the-art performance. Code is available at https://github.com/ChengxuLiu/MISCFilter.
****
DART: Implicit Doppler Tomography for Radar Novel View Synthesis
Tianshu Huang, John Miller, Akarsh Prabhakara, Tao Jin, Tarana Laroia, Zico Kolter, Anthony Rowe; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 24118-24129
Simulation is an invaluable tool for radio-frequency system designers that enables rapid prototyping of various algorithms for imaging target detection classification and tracking. However simulating realistic radar scans is a challenging task that requires an accurate model of the scene radio frequency material properties and a corresponding radar synthesis function. Rather than specifying these models explicitly we propose DART - Doppler Aided Radar Tomography a Neural Radiance Field-inspired method which uses radar-specific physics to create a reflectance and transmittance-based rendering pipeline for range-Doppler images. We then evaluate DART by constructing a custom data collection platform and collecting a novel radar dataset together with accurate position and instantaneous velocity measurements from lidar-based localization. In comparison to state-of-the-art baselines DART synthesizes superior radar range-Doppler images from novel views across all datasets and additionally can be used to generate high quality tomographic images.

Wonder3D: Single Image to 3D using Cross-Domain Diffusion
Xiaoxiao Long, Yuan-Chen Guo, Cheng Lin, Yuan Liu, Zhiyang Dou, Lingjie Liu, Yuexin Ma, Song-Hai Zhang, Marc Habermann, Christian Theobalt, Wenping Wang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 9970-9980
In this work we introduce Wonder3D a novel method for generating high-fidelity textured meshes from single-view images with remarkable efficiency. Recent methods based on the Score Distillation Sampling (SDS) loss methods have shown the potential to recover 3D geometry from 2D diffusion priors but they typically suffer from time-consuming per-shape optimization and inconsistent geometry. In contrast certain works directly produce 3D information via fast network inferences but their results are often of low quality and lack geometric details. To holistically improve the quality consistency and efficiency of image-to-3D tasks we propose a cross-domain diffusion model that generates multi-view normal maps and the corresponding color images. To ensure consistency we employ a multi-view cross-domain attention mechanism that facilitates information exchange across views and modalities. Lastly we introduce a geometry-aware normal fusion algorithm that extracts high-quality surfaces from the multi-view 2D representations in only 2 3 minutes. Our extensive evaluations demonstrate that our method achieves high-quality reconstruction results robust generalization and remarkable efficiency compared to prior works.
****
Genuine Knowledge from Practice: Diffusion Test-Time Adaptation for Video Adverse Weather Removal
Yijun Yang, Hongtao Wu, Angelica I. Aviles-Rivero, Yulun Zhang, Jing Qin, Lei Zhu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 25606-25616
Real-world vision tasks frequently suffer from the appearance of unexpected adverse weather conditions including rain haze snow and raindrops. In the last decade convolutional neural networks and vision transformers have yielded outstanding results in single-weather video removal. However due to the absence of appropriate adaptation most of them fail to generalize to other weather conditions. Although ViWS-Net is proposed to remove adverse weather conditions in videos with a single set of pre-trained weights it is seriously blinded by seen weather at train-time and degenerates when coming to unseen weather during test-time. In this

work we introduce test-time adaptation into adverse weather removal in videos and propose the first framework that integrates test-time adaptation into the iterative diffusion reverse process. Specifically we devise a diffusion-based network with a novel temporal noise model to efficiently explore frame-correlated information in degraded video clips at training stage. During inference stage we introduce a proxy task named Diffusion Tubelet Self-Calibration to learn the primer distribution of test video stream and optimize the model by approximating the temporal noise model for online adaptation. Experimental results on benchmark datasets demonstrate that our Test-Time Adaptation method with Diffusion-based network(Diff-TTA) outperforms state-of-the-art methods in terms of restoring videos degraded by seen weather conditions. Its generalizable capability is validated with unseen weather conditions in synthesized and real-world videos.

Gradient-based Parameter Selection for Efficient Fine-Tuning
Zhi Zhang, Qizhe Zhang, Zijun Gao, Renrui Zhang, Ekaterina Shutova, Shiji Zhou, Shanghang Zhang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 28566-28577
With the growing size of pre-trained models full fine-tuning and storing all the parameters for various downstream tasks is costly and infeasible. In this paper we propose a new parameter-efficient fine-tuning method Gradient-based Parameter Selection (GPS) demonstrating that only tuning a few selected parameters from the pre-trained model while keeping the remainder of the model frozen can generate similar or better performance compared with the full model fine-tuning method. Different from the existing popular and state-of-the-art parameter-efficient fine-tuning approaches our method does not introduce any additional parameters and computational costs during both the training and inference stages. Another advantage is the model-agnostic and non-destructive property which eliminates the need for any other design specific to a particular model. Compared with the full fine-tuning GPS achieves 3.33% (91.78% vs. 88.45% FGVC) and 9.61% (73.1% vs. 65.57% VTAB) improvement of the accuracy with tuning only 0.36% parameters of the pre-trained model on average over 24 image classification tasks; it also demonstrates a significant improvement of 17% and 16.8% in mDice and mIoU respectively on medical image segmentation task. Moreover GPS achieves state-of-the-art performance compared with existing PEFT methods. The code will be available in https://github.com/FightingFighting/GPS.git.
****
Clustering for Protein Representation Learning
Ruijie Quan, Wenguan Wang, Fan Ma, Hehe Fan, Yi Yang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 319-329
Protein representation learning is a challenging task that aims to capture the structure and function of proteins from their amino acid sequences. Previous methods largely ignored the fact that not all amino acids are equally important for protein folding and activity. In this article we propose a neural clustering framework that can automatically discover the critical components of a protein by considering both its primary and tertiary structure information. Our framework treats a protein as a graph where each node represents an amino acid and each edge represents a spatial or sequential connection between amino acids. We then apply an iterative clustering strategy to group the nodes into clusters based on their 1D and 3D positions and assign scores to each cluster. We select the highest-scoring clusters and use their medoid nodes for the next iteration of clustering until we obtain a hierarchical and informative representation of the protein. We evaluate on four protein-related tasks: protein fold classification enzyme reaction classification gene ontology term prediction and enzyme commission number prediction. Experimental results demonstrate that our method achieves state-of-the-art performance.

CorrMatch: Label Propagation via Correlation Matching for Semi-Supervised Semantic Segmentation
Boyuan Sun, Yuqi Yang, Le Zhang, Ming-Ming Cheng, Qibin Hou; Proceedings of the

IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp.
 3097-3107
This paper presents a simple but performant semi-supervised semantic segmentatio
n approach called CorrMatch. Previous approaches mostly employ complicated train
ing strategies to leverage unlabeled data but overlook the role of correlation m
aps in modeling the relationships between pairs of locations. We observe that th
e correlation maps not only enable clustering pixels of the same category easily
 but also contain good shape information which previous works have omitted. Moti
vated by these we aim to improve the use efficiency of unlabeled data by designi
ng two novel label propagation strategies. First we propose to conduct pixel pro
pagation by modeling the pairwise similarities of pixels to spread the high-conf
idence pixels and dig out more. Then we perform region propagation to enhance th
e pseudo labels with accurate class-agnostic masks extracted from the correlatio
n maps. CorrMatch achieves great performance on popular segmentation benchmarks.
 Taking the DeepLabV3+ with ResNet-101 backbone as our segmentation model we rec
eive a 76%+ mIoU score on the Pascal VOC 2012 dataset with only 92 annotated ima
ges. Code is available at https://github.com/BBBBchan/CorrMatch .

Estimating Extreme 3D Image Rotations using Cascaded Attention
Shay Dekel, Yosi Keller, Martin Cadik; Proceedings of the IEEE/CVF Conference on
 Computer Vision and Pattern Recognition (CVPR), 2024, pp. 2588-2598
Estimating large extreme inter-image rotations is critical for numerous computer
 vision domains involving images related by limited or non-overlapping fields of
 view. In this work we propose an attention-based approach with a pipeline of no
vel algorithmic components. First as rotation estimation pertains to image pairs
 we introduce an inter-image distillation scheme using Decoders to improve embed
dings. Second whereas contemporary methods compute a 4D correlation volume (4DCV
) encoding inter-image relationships we propose an Encoder-based cross-attention
 approach between activation maps to compute an enhanced equivalent of the 4DCV.
 Finally we present a cascaded Decoder-based technique for alternately refining
the cross-attention and the rotation query. Our approach outperforms current sta
te-of-the-art methods on extreme rotation estimation. We make our code publicly
available.

RichDreamer: A Generalizable Normal-Depth Diffusion Model for Detail Richness in
 Text-to-3D
Lingteng Qiu, Guanying Chen, Xiaodong Gu, Qi Zuo, Mutian Xu, Yushuang Wu, Weihao
 Yuan, Zilong Dong, Liefeng Bo, Xiaoguang Han; Proceedings of the IEEE/CVF Confe
rence on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 9914-9925
Lifting 2D diffusion for 3D generation is a challenging problem due to the lack
of geometric prior and the complex entanglement of materials and lighting in nat
ural images. Existing methods have shown promise by first creating the geometry
through score-distillation sampling (SDS) applied to rendered surface normals fo
llowed by appearance modeling. However relying on a 2D RGB diffusion model to op
timize surface normals is suboptimal due to the distribution discrepancy between
 natural images and normals maps leading to instability in optimization. In this
 paper recognizing that the normal and depth information effectively describe sc
ene geometry and be automatically estimated from images we propose to learn a ge
neralizable Normal-Depth diffusion model for 3D generation. We achieve this by t
raining on the large-scale LAION dataset together with the generalizable image-t
o-depth and normal prior models. In an attempt to alleviate the mixed illuminati
on effects in the generated materials we introduce an albedo diffusion model to
impose data-driven constraints on the albedo component. Our experiments show tha
t when integrated into existing text-to-3D pipelines our models significantly en
hance the detail richness achieving state-of-the-art results. Our project page i
s at https://aigc3d.github.io/richdreamer/.

Adapt or Perish: Adaptive Sparse Transformer with Attentive Feature Refinement f
or Image Restoration
Shihao Zhou, Duosheng Chen, Jinshan Pan, Jinglei Shi, Jufeng Yang; Proceedings o

f the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 2952-2963
Transformer-based approaches have achieved promising performance in image restoration tasks given their ability to model long-range dependencies which is crucial for recovering clear images. Though diverse efficient attention mechanism designs have addressed the intensive computations associated with using transformers they often involve redundant information and noisy interactions from irrelevant regions by considering all available tokens. In this work we propose an Adaptive Sparse Transformer (AST) to mitigate the noisy interactions of irrelevant areas and remove feature redundancy in both spatial and channel domains. AST comprises two core designs i.e. an Adaptive Sparse Self-Attention (ASSA) block and a Feature Refinement Feed-forward Network (FRFN). Specifically ASSA is adaptively computed using a two-branch paradigm where the sparse branch is introduced to filter out the negative impacts of low query-key matching scores for aggregating features while the dense one ensures sufficient information flow through the network for learning discriminative representations. Meanwhile FRFN employs an enhance-and-ease scheme to eliminate feature redundancy in channels enhancing the restoration of clear latent images. Experimental results on commonly used benchmarks have demonstrated the versatility and competitive performance of our method in several tasks including rain streak removal real haze removal and raindrop removal. The code and pre-trained models are available at https://github.com/joshyZhou/AST.

VINECS: Video-based Neural Character Skinning
Zhouyingcheng Liao, Vladislav Golyanik, Marc Habermann, Christian Theobalt; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 1377-1387
Rigging and skinning clothed human avatars is a challenging task and traditionally requires a lot of manual work and expertise. Recent methods addressing it either generalize across different characters or focus on capturing the dynamics of a single character observed under different pose configurations. However the former methods typically predict solely static skinning weights which perform poorly for highly articulated poses and the latter ones either require dense 3D character scans in different poses or cannot generate an explicit mesh with vertex correspondence over time. To address these challenges we propose a fully automated approach for creating a fully rigged character with pose-dependent skinning weights which can be solely learned from multi-view video. Therefore we first acquire a rigged template which is then statically skinned. Next a coordinate-based MLP learns a skinning weights field parameterized over the position in a canonical pose space and the respective pose. Moreover we introduce our pose- and view-dependent appearance field allowing us to differentiably render and supervise the posed mesh using multi-view imagery. We show that our approach outperforms state-of-the-art while not relying on dense 4D scans. More details can be found on our project page.

Zero-shot Referring Expression Comprehension via Structural Similarity Between Images and Captions
Zeyu Han, Fangrui Zhu, Qianru Lao, Huaizu Jiang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 14364-14374
Zero-shot referring expression comprehension aims at localizing bounding boxes in an image corresponding to provided textual prompts which requires: (i) a fine-grained disentanglement of complex visual scene and textual context and (ii) a capacity to understand relationships among disentangled entities. Unfortunately existing large vision-language alignment (VLA) models e.g. CLIP struggle with both aspects so cannot be directly used for this task. To mitigate this gap we leverage large foundation models to disentangle both images and texts into triplets in the format of (subject predicate object). After that grounding is accomplished by calculating the structural similarity matrix between visual and textual triplets with a VLA model and subsequently propagate it to an instance-level similarity matrix. Furthermore to equip VLA models with the ability of relationship un

derstanding we design a triplet-matching objective to fine-tune the VLA models on a collection of curated dataset containing abundant entity relationships. Experiments demonstrate that our visual grounding performance increase of up to 19.5% over the SOTA zero-shot model on RefCOCO/+/g. On the more challenging Who's Waldo dataset our zero-shot approach achieves comparable accuracy to the fully supervised model. Code is available at https://github.com/Show-han/Zeroshot_REC.

Domain Prompt Learning with Quaternion Networks
Qinglong Cao, Zhengqin Xu, Yuntian Chen, Chao Ma, Xiaokang Yang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 26637-26646
Prompt learning has emerged as an effective and data-efficient technique in large Vision-Language Models (VLMs). However when adapting VLMs to specialized domains such as remote sensing and medical imaging domain prompt learning remains underexplored. While large-scale domain-specific foundation models can help tackle this challenge their concentration on a single vision level makes it challenging to prompt both vision and language modalities. To overcome this we propose to leverage domain-specific knowledge from domain-specific foundation models to transfer the robust recognition ability of VLMs from generalized to specialized domains using quaternion networks. Specifically the proposed method involves using domain-specific vision features from domain-specific foundation models to guide the transformation of generalized contextual embeddings from the language branch into a specialized space within the quaternion networks. Moreover we present a hierarchical approach that generates vision prompt features by analyzing intermodal relationships between hierarchical language prompt features and domain-specific vision features. In this way quaternion networks can effectively mine the intermodal relationships in the specific domain facilitating domain-specific vision-language contrastive learning. Extensive experiments on domain-specific datasets show that our proposed method achieves new state-of-the-art results in prompt learning.

BEHAVIOR Vision Suite: Customizable Dataset Generation via Simulation
Yunhao Ge, Yihe Tang, Jiashu Xu, Cem Gokmen, Chengshu Li, Wensi Ai, Benjamin Jose Martinez, Arman Aydin, Mona Anvari, Ayush K Chakravarthy, Hong-Xing Yu, Josiah Wong, Sanjana Srivastava, Sharon Lee, Shengxin Zha, Laurent Itti, Yunzhu Li, Roberto Martín-Martín, Miao Liu, Pengchuan Zhang, Ruohan Zhang, Li Fei-Fei, Jiajun Wu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 22401-22412
The systematic evaluation and understanding of computer vision models under varying conditions require large amounts of data with comprehensive and customized labels which real-world vision datasets rarely satisfy. While current synthetic data generators offer a promising alternative particularly for embodied AI tasks they often fall short for computer vision tasks due to low asset and rendering quality limited diversity and unrealistic physical properties. We introduce the BEHAVIOR Vision Suite (BVS) a set of tools and assets to generate fully customized synthetic data for systematic evaluation of computer vision models based on the newly developed embodied AI benchmark BEHAVIOR-1K. BVS supports a large number of adjustable parameters at the scene level (e.g. lighting object placement) the object level (e.g. joint configuration attributes such as "filled" and "folded") and the camera level (e.g. field of view focal length). Researchers can arbitrarily vary these parameters during data generation to perform controlled experiments. We showcase three example application scenarios: systematically evaluating the robustness of models across different continuous axes of domain shift evaluating scene understanding models on the same set of images and training and evaluating simulation-to-real transfer for a novel vision task: unary and binary state prediction. Project website: https://behavior-vision-suite.github.io/

Triplane Meets Gaussian Splatting: Fast and Generalizable Single-View 3D Reconstruction with Transformers
Zi-Xin Zou, Zhipeng Yu, Yuan-Chen Guo, Yangguang Li, Ding Liang, Yan-Pei Cao, So

ng-Hai Zhang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 10324-10335

Recent advancements in 3D reconstruction from single images have been driven by the evolution of generative models. Prominent among these are methods based on Score Distillation Sampling (SDS) and the adaptation of diffusion models in the 3D domain. Despite their progress these techniques often face limitations due to slow optimization or rendering processes leading to extensive training and optimization times. In this paper we introduce a novel approach for single-view reconstruction that efficiently generates a 3D model from a single image via feed-forward inference. Our method utilizes two transformer-based networks namely a point decoder and a triplane decoder to reconstruct 3D objects using a hybrid Triplane-Gaussian intermediate representation. This hybrid representation strikes a balance achieving a faster rendering speed compared to implicit representations while simultaneously delivering superior rendering quality than explicit representations. The point decoder is designed for generating point clouds from single images offering an explicit representation which is then utilized by the triplane decoder to query Gaussian features for each point. This design choice addresses the challenges associated with directly regressing explicit 3D Gaussian attributes characterized by their non-structural nature. Subsequently the 3D Gaussians are decoded by an MLP to enable rapid rendering through splatting. Both decoders are built upon a scalable transformer-based architecture and have been efficiently trained on large-scale 3D datasets. The evaluations conducted on both synthetic datasets and real-world images demonstrate that our method not only achieves higher quality but also ensures a faster runtime in comparison to previous state-of-the-art techniques. Please see our project page at https://zouzx.github.io/TriplaneGaussian/

WateRF: Robust Watermarks in Radiance Fields for Protection of Copyrights

Youngdong Jang, Dong In Lee, MinHyuk Jang, Jong Wook Kim, Feng Yang, Sangpil Kim; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 12087-12097

The advances in the Neural Radiance Fields (NeRF) research offer extensive applications in diverse domains but protecting their copyrights has not yet been researched in depth. Recently NeRF watermarking has been considered one of the pivotal solutions for safely deploying NeRF-based 3D representations. However existing methods are designed to apply only to implicit or explicit NeRF representations. In this work we introduce an innovative watermarking method that can be employed in both representations of NeRF. This is achieved by fine-tuning NeRF to embed binary messages in the rendering process. In detail we propose utilizing the discrete wavelet transform in the NeRF space for watermarking. Furthermore we adopt a deferred back-propagation technique and introduce a combination with the patch-wise loss to improve rendering quality and bit accuracy with minimum trade-offs. We evaluate our method in three different aspects: capacity invisibility and robustness of the embedded watermarks in the 2D-rendered images. Our method achieves state-of-the-art performance with faster training speed over the compared state-of-the-art methods. Project page: https://kuai-lab.github.io/cvpr2024waterf/

Gaussian-Flow: 4D Reconstruction with Dynamic 3D Gaussian Particle

Youtian Lin, Zuozhuo Dai, Siyu Zhu, Yao Yao; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 21136-21145

We introduce Gaussian-Flow a novel point-based approach for fast dynamic scene reconstruction and real-time rendering from both multi-view and monocular videos. In contrast to the prevalent NeRF-based approaches hampered by slow training and rendering speeds our approach harnesses recent advancements in point-based 3D Gaussian Splatting (3DGS). Specifically a novel Dual-Domain Deformation Model (DDDM) is proposed to explicitly model attribute deformations of each Gaussian point where the time-dependent residual of each attribute is captured by a polynomial fitting in the time domain and a Fourier series fitting in the frequency domain. The proposed DDDM is capable of modeling complex scene deformations across l

ong video footage eliminating the need for training separate 3DGS for each frame or introducing an additional implicit neural field to model 3D dynamics. Moreover the explicit deformation modeling for discretized Gaussian points ensures ultra-fast training and rendering of a 4D scene which is comparable to the original 3DGS designed for static 3D reconstruction. Our proposed approach showcases a substantial efficiency improvement achieving a 5xfaster training speed compared to the per-frame 3DGS modeling. In addition quantitative results demonstrate that the proposed Gaussian-Flow significantly outperforms previous leading methods in novel view rendering quality.

Your Student is Better Than Expected: Adaptive Teacher-Student Collaboration for Text-Conditional Diffusion Models
Nikita Starodubcev, Dmitry Baranchuk, Artem Fedorov, Artem Babenko; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 9275-9285
Knowledge distillation methods have recently shown to be a promising direction to speedup the synthesis of large-scale diffusion models by requiring only a few inference steps. While several powerful distillation methods were recently proposed the overall quality of student samples is typically lower compared to the teacher ones which hinders their practical usage. In this work we investigate the relative quality of samples produced by the teacher text-to-image diffusion model and its distilled student version. As our main empirical finding we discover that a noticeable portion of student samples exhibit superior fidelity compared to the teacher ones despite the approximate nature of the student. Based on this finding we propose an adaptive collaboration between student and teacher diffusion models for effective text-to-image synthesis. Specifically the distilled model produces an initial image sample and then an oracle decides whether it needs further improvements with the teacher model. Extensive experiments demonstrate that the designed pipeline surpasses state-of-the-art text-to-image alternatives for various inference budgets in terms of human preference. Furthermore the proposed approach can be naturally used in popular applications such as text-guided image editing and controllable generation.

DiVAS: Video and Audio Synchronization with Dynamic Frame Rates
Clara Fernandez-Labrador, Mertcan Akçay, Eitan Abecassis, Joan Massich, Christopher Schroers; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 26846-26854
Synchronization issues between audio and video are one of the most disturbing quality defects in film production and live broadcasting. Even a discrepancy as short as 45 millisecond can degrade the viewer's experience enough to warrant manual quality checks over entire movies. In this paper we study the automatic discovery of such issues. Specifically we focus on the alignment of lip movements with spoken words targeting realistic production scenarios which can include background noise and music intricate head poses excessive makeup or scenes with multiple individuals where the speaker is unknown. Our model's robustness also extends to various media specifications including different video frame rates and audio sample rates. To address these challenges we present a model fully based on transformers that encodes face crops or full video frames and raw audio using timestamp information identifies the speaker and provides highly accurate synchronization predictions much faster than previous methods.

SHViT: Single-Head Vision Transformer with Memory Efficient Macro Design
Seokju Yun, Youngmin Ro; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 5756-5767
Recently efficient Vision Transformers have shown great performance with low latency on resource-constrained devices. Conventionally they use 4x4 patch embeddings and a 4-stage structure at the macro level while utilizing sophisticated attention with multi-head configuration at the micro level. This paper aims to address computational redundancy at all design levels in a memory-efficient manner. We discover that using larger-stride patchify stem not only reduces memory access

costs but also achieves competitive performance by leveraging token representations with reduced spatial redundancy from the early stages. Furthermore our preliminary analyses suggest that attention layers in the early stages can be substituted with convolutions and several attention heads in the latter stages are computationally redundant. To handle this we introduce a single-head attention module that inherently prevents head redundancy and simultaneously boosts accuracy by parallelly combining global and local information. Building upon our solutions we introduce SHViT a Single-Head Vision Transformer that obtains the state-of-the-art speed-accuracy tradeoff. For example on ImageNet-1k our SHViT-S4 is 3.3x 8.1x and 2.4x faster than MobileViTv2x1.0 on GPU CPU and iPhone12 mobile device respectively while being 1.3% more accurate. For object detection and instance segmentation on MS COCO using Mask-RCNN head our model achieves performance comparable to FastViT-SA12 while exhibiting 3.8x and 2.0x lower backbone latency on GPU and mobile device respectively.

HDRFlow: Real-Time HDR Video Reconstruction with Large Motions
Gangwei Xu, Yujin Wang, Jinwei Gu, Tianfan Xue, Xin Yang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 24851-24860
Reconstructing High Dynamic Range (HDR) video from image sequences captured with alternating exposures is challenging especially in the presence of large camera or object motion. Existing methods typically align low dynamic range sequences using optical flow or attention mechanism for deghosting. However they often struggle to handle large complex motions and are computationally expensive. To address these challenges we propose a robust and efficient flow estimator tailored for real-time HDR video reconstruction named HDRFlow. HDRFlow has three novel designs: an HDR-domain alignment loss (HALoss) an efficient flow network with a multi-size large kernel (MLK) and a new HDR flow training scheme. The HALoss supervises our flow network to learn an HDR-oriented flow for accurate alignment in saturated and dark regions. The MLK can effectively model large motions at a negligible cost. In addition we incorporate synthetic data Sintel into our training dataset utilizing both its provided forward flow and backward flow generated by us to supervise our flow network enhancing our performance in large motion regions. Extensive experiments demonstrate that our HDRFlow outperforms previous methods on standard benchmarks. To the best of our knowledge HDRFlow is the first real-time HDR video reconstruction method for video sequences captured with alternating exposures capable of processing 720p resolution inputs at 25ms.

SPIDeRS: Structured Polarization for Invisible Depth and Reflectance Sensing
Tomoki Ichikawa, Shohei Nobuhara, Ko Nishino; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 25077-25085
Can we capture shape and reflectance in stealth? Such capability would be valuable for many application domains in vision xR robotics and HCI. We introduce structured polarization for invisible depth and reflectance sensing (SPIDeRS) the first depth and reflectance sensing method using patterns of polarized light. The key idea is to modulate the angle of linear polarization (AoLP) of projected light at each pixel. The use of polarization makes it invisible and lets us recover not only depth but also directly surface normals and even reflectance. We implement SPIDeRS with a liquid crystal spatial light modulator (SLM) and a polarimetric camera. We derive a novel method for robustly extracting the projected structured polarization pattern from the polarimetric object appearance. We evaluate the effectiveness of SPIDeRS by applying it to a number of real-world objects. The results show that our method successfully reconstructs object shapes of various materials and is robust to diffuse reflection and ambient light. We also demonstrate relighting using recovered surface normals and reflectance. We believe SPIDeRS opens a new avenue of polarization use in visual sensing.

SuperNormal: Neural Surface Reconstruction via Multi-View Normal Integration
Xu Cao, Takafumi Taketomi; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 20581-20590

We present SuperNormal a fast high-fidelity approach to multi-view 3D reconstruc
tion using surface normal maps. With a few minutes SuperNormal produces detailed
 surfaces on par with 3D scanners. We harness volume rendering to optimize a neu
ral signed distance function (SDF) powered by multi-resolution hash encoding. To
 accelerate training we propose directional finite difference and patchbased ray
 marching to approximate the SDF gradients numerically. While not compromising r
econstruction quality this strategy is nearly twice as efficient as analytical g
radients and about three times faster than axis-aligned finite difference. Exper
iments on the benchmark dataset demonstrate the superiority of SuperNormal in ef
ficiency and accuracy compared to existing multi-view photometric stereo methods
. On our captured objects SuperNormal produces more fine-grained geometry than r
ecent neural 3D reconstruction methods. Our code is available at https://github.
com/CyberAgentAILab/SuperNormal.git.

Instance-aware Contrastive Learning for Occluded Human Mesh Reconstruction
Mi-Gyeong Gwon, Gi-Mun Um, Won-Sik Cheong, Wonjun Kim; Proceedings of the IEEE/C
VF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 10553
-10562
A simple yet effective method for occlusion-robust 3D human mesh reconstruction
from a single image is presented in this paper. Although many recent studies hav
e shown the remarkable improvement in human mesh reconstruction it is still diff
icult to generate accurate meshes when person-to-person occlusion occurs due to
the ambiguity of who a body part belongs to. To address this problem we propose
an instance-aware contrastive learning scheme. Specifically joint features belon
ging to the target human are trained to be proximate with the anchor feature (i.
e. feature extracted from the body center position). On the other hand anchor fe
atures of different human instances are forced to be far apart so that joint fea
tures of each person can be clearly distinguished from others. By interpreting t
he joint possession based on such contrastive learning scheme the proposed metho
d easily understands the spatial occupancy of body parts for each person in a gi
ven image thus can reconstruct reliable human meshes even with severely overlapp
ed cases between multiple persons. Experimental results on benchmark datasets de
monstrate the robustness of the proposed method compared to previous approaches
under person-to-person occlusions. The code and model are publicly available at:
 https://github.com/DCVL-3D/InstanceHMR_release.

ADFactory: An Effective Framework for Generalizing Optical Flow with NeRF
Han Ling, Quansen Sun, Yinghui Sun, Xian Xu, Xinfeng Li; Proceedings of the IEEE
/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 205
91-20600
A significant challenge facing current optical flow methods is the difficulty in
 generalizing them well to the real world. This is mainly due to the lack of lar
ge-scale real-world datasets and existing self-supervised methods are limited by
 indirect loss and occlusions resulting in fuzzy outcomes. To address this chall
enge we introduce a novel optical flow training framework: automatic data factor
y (ADF). ADF only requires RGB images as input to effectively train the optical
flow network on the target data domain. Specifically we use advanced NeRF techno
logy to reconstruct scenes from photo groups collected by a monocular camera and
 then calculate optical flow labels between camera pose pairs based on the rende
ring results. To eliminate erroneous labels caused by defects in the scene recon
structed by NeRF we screened the generated labels from multiple aspects such as
optical flow matching accuracy radiation field confidence and depth consistency.
 The filtered labels can be directly used for network supervision. Experimentall
y the generalization ability of ADF on KITTI surpasses existing self-supervised
optical flow and monocular scene flow algorithms. In addition ADF achieves impre
ssive results in real-world zero-point generalization evaluations and surpasses
most supervised methods.

Robust Noisy Correspondence Learning with Equivariant Similarity Consistency
Yuchen Yang, Likai Wang, Erkun Yang, Cheng Deng; Proceedings of the IEEE/CVF Con

ference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 17700-17709
The surge in multi-modal data has propelled cross-modal matching to the forefron
t of research interest. However the challenge lies in the laborious and expensiv
e process of curating a large and accurately matched multimodal dataset. Commonl
y sourced from the Internet these datasets often suffer from a significant prese
nce of mismatched data impairing the performance of matching models. To address
this problem we introduce a novel regularization approach named Equivariant Simi
larity Consistency (ESC) which can facilitate robust clean and noisy data separa
tion and improve the training for cross-modal matching. Intuitively our method p
osits that the semantic variations caused by image changes should be proportiona
l to those caused by text changes for any two matched samples. Accordingly we fi
rst calculate the ESC by comparing image and text semantic variations between a
set of elaborated anchor points and other undivided training data. Then pairs wi
th high ESC are filtered out as noisy correspondence pairs. We implement our met
hod by combining the ESC with a traditional hinge-based triplet loss. Extensive
experiments on three widely used datasets including Flickr30K MS-COCO and Concep
tual Captions verify the effectiveness of our method.

CommonCanvas: Open Diffusion Models Trained on Creative-Commons Images
Aaron Gokaslan, A. Feder Cooper, Jasmine Collins, Landan Seguin, Austin Jacobson
, Mihir Patel, Jonathan Frankle, Cory Stephenson, Volodymyr Kuleshov; Proceeding
s of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR),
2024, pp. 8250-8260
We train a set of open text-to-image (T2I) diffusion models on a dataset of cura
ted Creative-Commons-licensed (CC) images which yields models that are competiti
ve with Stable Diffusion 2 (SD2). This task presents two challenges: (1) high-re
solution CC images lack the captions necessary to train T2I models; (2) CC image
s are relatively scarce. To address these challenges we use an intuitive transfe
r learning technique to produce a set of high-quality synthetic captions paired
with our assembled CC images. We then develop a data- and compute-efficient trai
ning recipe that requires as little as 3% of the LAION data (i.e. roughly 70 mil
lion examples) needed to train existing SD2 models but obtains the same quality.
These results indicate that we have a sufficient number of CC images (also roug
hly 70 million) for training high-quality models. Our recipe also implements a v
ariety of optimizations that achieve 2.71x training speed-ups enabling rapid mod
el iteration. We leverage this recipe to train several high-quality T2I mod- els
which we dub the CommonCanvas family. Our largest model achieves comparable per
formance to SD2 on human evaluation even though we use a synthetically captioned
CC-image dataset that is only <3% the size of LAION for training. We release ou
r models data and code on GitHub.

Prompt-Driven Referring Image Segmentation with Instance Contrasting
Chao Shang, Zichen Song, Heqian Qiu, Lanxiao Wang, Fanman Meng, Hongliang Li; Pr
oceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition
(CVPR), 2024, pp. 4124-4134
Referring image segmentation (RIS) aims to segment the target referent described
by natural language. Recently large-scale pre-trained models e.g. CLIP and SAM
have been successfully applied in many downstream tasks but they are not well ad
apted to RIS task due to inter-task differences. In this paper we propose a new
prompt-driven framework named Prompt-RIS which bridges CLIP and SAM end-to-end a
nd transfers their rich knowledge and powerful capabilities to RIS task through
prompt learning. To adapt CLIP to pixel-level task we first propose a Cross-Moda
l Prompting method which acquires more comprehensive vision-language interaction
and fine-grained text-to-pixel alignment by performing bidirectional prompting.
Then the prompt-tuned CLIP generates masks points and text prompts for SAM to g
enerate more accurate mask predictions. Moreover we further propose Instance Con
trastive Learning to improve the model's discriminability to different instances
and robustness to diverse languages describing the same instance. Extensive exp
eriments demonstrate that the performance of our method outperforms the state-of
-the-art methods consistently in both general and open-vocabulary settings.

Image Sculpting: Precise Object Editing with 3D Geometry Control

Jiraphon Yenphraphai, Xichen Pan, Sainan Liu, Daniele Panozzo, Saining Xie; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 4241-4251

We present Image Sculpting a new framework for editing 2D images by incorporating tools from 3D geometry and graphics. This approach differs markedly from existing methods which are confined to 2D spaces and typically rely on textual instructions leading to ambiguity and limited control. Image Sculpting converts 2D objects into 3D enabling direct interaction with their 3D geometry. Post-editing these objects are re-rendered into 2D merging into the original image to produce high-fidelity results through a coarse-to-fine enhancement process. The framework supports precise quantifiable and physically-plausible editing options such as pose editing rotation translation 3D composition carving and serial addition. It marks an initial step towards combining the creative freedom of generative models with the precision of graphics pipelines.

Compositional Video Understanding with Spatiotemporal Structure-based Transformers

Hoyeoung Yun, Jinwoo Ahn, Minseo Kim, Eun-Sol Kim; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 18751-18760

In this paper we suggest a new novel method to understand complex semantic structures through long video inputs. Conventional methods for understanding videos have been focused on short-term clips and trained to get visual representations for the short clips using convolutional neural networks or transformer architectures. However most real-world videos are composed of long videos ranging from minutes to hours therefore it essentially brings limitations to understanding the overall semantic structures of the long videos by dividing them into small clips and learning the representations of them. We suggest a new algorithm to learn the multi-granular semantic structures of videos by defining spatiotemporal high-order relationships among object-based representations as semantic units. The proposed method includes a new transformer architecture capable of learning spatiotemporal graphs and a compositional learning method to learn disentangled features for each semantic unit. Using the suggested method we resolve the challenging video task which is compositional generalization understanding of unseen videos. In experiments we demonstrate new state-of-the-art performances for two challenging video datasets.

3D LiDAR Mapping in Dynamic Environments using a 4D Implicit Neural Representation

Xingguang Zhong, Yue Pan, Cyrill Stachniss, Jens Behley; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 15417-15427

Building accurate maps is a key building block to enable reliable localization planning and navigation of autonomous vehicles. We propose a novel approach for building accurate 3D maps of dynamic environments utilizing a sequence of LiDAR scans. To this end we propose encoding the 4D scene into a novel spatio-temporal implicit neural map representation by fitting a time-dependent truncated signed distance function to each point. Using our representation we can extract the static map by filtering the dynamic parts. Our neural representation is based on sparse feature grids a globally shared decoder and time-dependent basis functions which can be jointly optimized in an unsupervised fashion. To learn this representation from a sequence of LiDAR scans we design a simple yet efficient loss function to supervise the map optimization in a piecewise way. We evaluate our approach on various scenes containing moving objects in terms of the reconstruction quality of static maps and the segmentation of dynamic point clouds. The experimental results demonstrate that our method is capable of removing the dynamic part of the input point clouds while reconstructing accurate and complete large-scale 3D maps outperforming several state-of-the-art methods for static map generat

ion and scene reconstruction.

What When and Where? Self-Supervised Spatio-Temporal Grounding in Untrimmed Multi-Action Videos from Narrated Instructions
Brian Chen, Nina Shvetsova, Andrew Rouditchenko, Daniel Kondermann, Samuel Thomas, Shih-Fu Chang, Rogerio Feris, James Glass, Hilde Kuehne; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 18419-18429
Spatio-temporal grounding describes the task of localizing events in space and time e.g. in video data based on verbal descriptions only. Models for this task are usually trained with human-annotated sentences and bounding box supervision. This work addresses this task from a multimodal supervision perspective proposing a framework for spatio-temporal action grounding trained on loose video and subtitle supervision only without human annotation. To this end we combine local representation learning which focuses on leveraging fine-grained spatial information with a global representation encoding that captures higher-level representations and incorporates both in a joint approach. To evaluate this challenging task in a real-life setting a new benchmark dataset is proposed providing dense spatio-temporal grounding annotations in long untrimmed multi-action instructional videos for over 5K events. We evaluate the proposed approach and other methods on the proposed and standard downstream tasks showing that our method improves over current baselines in various settings including spatial temporal and untrimmed multi-action spatio-temporal grounding.

How Far Can We Compress Instant-NGP-Based NeRF?
Yihang Chen, Qianyi Wu, Mehrtash Harandi, Jianfei Cai; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 20321-20330
In recent years Neural Radiance Field (NeRF) has demonstrated remarkable capabilities in representing 3D scenes. To expedite the rendering process learnable explicit representations have been introduced for combination with implicit NeRF representation which however results in a large storage space requirement. In this paper we introduce the Context-based NeRF Compression (CNC) framework which leverages highly efficient context models to provide a storage-friendly NeRF representation. Specifically we excavate both level-wise and dimension-wise context dependencies to enable probability prediction for information entropy reduction. Additionally we exploit hash collision and occupancy grids as strong prior knowledge for better context modeling. To the best of our knowledge we are the first to construct and exploit context models for NeRF compression. We achieve a size reduction of 100X and 70X with improved fidelity against the baseline Instant-NGP on Synthesic-NeRF and Tanks and Temples datasets respectively. Additionally we attain 86.7% and 82.3% storage size reduction against the SOTA NeRF compression

method BiRF. Our code is available here: https://github.com/YihangChen-ee/CNC.

PFStorer: Personalized Face Restoration and Super-Resolution
Tuomas Varanka, Tapani Toivonen, Soumya Tripathy, Guoying Zhao, Erman Acar; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 2372-2381
Recent developments in face restoration have achieved remarkable results in producing high-quality and lifelike outputs. The stunning results however often fail to be faithful with respect to the identity of the person as the models lack necessary context. In this paper we explore the potential of personalized face restoration with diffusion models. In our approach a restoration model is personalized using a few images of the identity leading to tailored restoration with respect to the identity while retaining fine-grained details. By using independent trainable blocks for personalization the rich prior of a base restoration model can be exploited to its fullest. To avoid the model relying on parts of identity left in the conditioning low-quality images a generative regularizer is employed. With a learnable parameter the model learns to balance between the details generated based on the input image and the degree of personalization. Moreover we improve the training pipeline of face restoration models to enable an alignment-free approach. We showcase the robust capabilities of our approach in several real-world scenarios with multiple identities demonstrating our method's ability to generate fine-grained details with faithful restoration. In the user study we evaluate the perceptual quality and faithfulness of the generated details with our method being voted best 61% of the time compared to the second best with 25% of the votes.

TextureDreamer: Image-Guided Texture Synthesis Through Geometry-Aware Diffusion
Yu-Ying Yeh, Jia-Bin Huang, Changil Kim, Lei Xiao, Thu Nguyen-Phuoc, Numair Khan, Cheng Zhang, Manmohan Chandraker, Carl S Marshall, Zhao Dong, Zhengqin Li; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 4304-4314
We present TextureDreamer a novel image-guided texture synthesis method to transfer relightable textures from a small number of input images (3 to 5) to target 3D shapes across arbitrary categories. Texture creation is a pivotal challenge in vision and graphics. Industrial companies hire experienced artists to manually craft textures for 3D assets. Classical methods require densely sampled views and accurately aligned geometry while learning-based methods are confined to category-specific shapes within the dataset. In contrast TextureDreamer can transfer highly detailed intricate textures from real-world environments to arbitrary objects with only a few casually captured images potentially significantly democratizing texture creation. Our core idea personalized geometry-aware score distillation (PGSD) draws inspiration from recent advancements in diffuse models including personalized modeling for texture information extraction score distillation for detailed appearance synthesis and explicit geometry guidance with ControlNet. Our integration and several essential modifications substantially improve the texture quality. Experiments on real images spanning different categories show that TextureDreamer can successfully transfer highly realistic semantic meaningful texture to arbitrary objects surpassing the visual quality of previous state-of-the-art. Project page: https://texturedreamer.github.io

Boosting Image Quality Assessment through Efficient Transformer Adaptation with Local Feature Enhancement
Kangmin Xu, Liang Liao, Jing Xiao, Chaofeng Chen, Haoning Wu, Qiong Yan, Weisi Lin; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 2662-2672
Image Quality Assessment (IQA) constitutes a fundamental task within the field of computer vision yet it remains an unresolved challenge owing to the intricate distortion conditions diverse image contents and limited availability of data. Recently the community has witnessed the emergence of numerous large-scale pretrained foundation models. However it remains an open problem whether the scaling l

aw in high-level tasks is also applicable to IQA tasks which are closely related to low-level clues. In this paper we demonstrate that with a proper injection of local distortion features a larger pretrained vision transformer (ViT) foundation model performs better in IQA tasks. Specifically for the lack of local distortion structure and inductive bias of the large-scale pretrained ViT we use another pretrained convolution neural networks (CNNs) which is well known for capturing the local structure to extract multi-scale image features. Further we propose a local distortion extractor to obtain local distortion features from the pretrained CNNs and a local distortion injector to inject the local distortion features into ViT. By only training the extractor and injector our method can benefit from the rich knowledge in the powerful foundation models and achieve state-of-the-art performance on popular IQA datasets indicating that IQA is not only a low-level problem but also benefits from stronger high-level features drawn from large-scale pretrained models. Codes are publicly available at: https://github.com/NeosXu/LoDa.

Hyperbolic Anomaly Detection
Huimin Li, Zhentao Chen, Yunhao Xu, Junlin Hu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 17511-17520
Anomaly detection is a challenging computer vision task in industrial scenario. Advancements in deep learning constantly revolutionize vision-based anomaly detection methods and considerable progress has been made in both supervised and self-supervised anomaly detection. The commonly-used pipeline is to optimize the model by constraining the feature embeddings using a distance-based loss function. However these methods work in Euclidean space and they cannot well exploit the data lied in non-Euclidean space. In this paper we are the first to explore anomaly detection task in hyperbolic space that is a representative of non-Euclidean space and propose a hyperbolic anomaly detection (HypAD) method. Specifically we first extract image features and then map them from Euclidean space to hyperbolic space where the hyperbolic distance metric is employed to optimize the proposed HypAD. Extensive experiments on the benchmarking datasets including MVTec AD and VisA show that our HypAD approach obtains the state-of-the-art performance demonstrating the effectiveness of our HypAD and the promise of investigating anomaly detection in hyperbolic space.

VLP: Vision Language Planning for Autonomous Driving
Chenbin Pan, Burhaneddin Yaman, Tommaso Nesti, Abhirup Mallik, Alessandro G Allievi, Senem Velipasalar, Liu Ren; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 14760-14769
Autonomous driving is a complex and challenging task that aims at safe motion planning through scene understanding and reasoning. While vision-only autonomous driving methods have recently achieved notable performance through enhanced scene understanding several key issues including lack of reasoning low generalization performance and long-tail scenarios still need to be addressed. In this paper we present VLP a novel Vision-Language-Planning framework that exploits language models to bridge the gap between linguistic understanding and autonomous driving. VLP enhances autonomous driving systems by strengthening both the source memory foundation and the self-driving car's contextual understanding. VLP achieves state-of-the-art end-to-end planning performance on the challenging NuScenes dataset by achieving 35.9% and 60.5% reduction in terms of average L2 error and collision rates respectively compared to the previous best method. Moreover VLP shows improved performance in challenging long-tail scenarios and strong generalization capabilities when faced with new urban environments.

Attention Calibration for Disentangled Text-to-Image Personalization
Yanbing Zhang, Mengping Yang, Qin Zhou, Zhe Wang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 4764-4774
Recent thrilling progress in large-scale text-to-image (T2I) models has unlocked unprecedented synthesis quality of AI-generated content (AIGC) including image generation 3D and video composition. Further personalized techniques enable appe

aling customized production of a novel concept given only several images as refe
rence. However an intriguing problem persists: Is it possible to capture multipl
e novel concepts from one single reference image? In this paper we identify that
 existing approaches fail to preserve visual consistency with the reference imag
e and eliminate cross-influence from concepts. To alleviate this we propose an a
ttention calibration mechanism to improve the concept-level understanding of the
 T2I model. Specifically we first introduce new learnable modifiers bound with c
lasses to capture attributes of multiple concepts. Then the classes are separate
d and strengthened following the activation of the cross-attention operation ens
uring comprehensive and self-contained concepts. Additionally we suppress the at
tention activation of different classes to mitigate mutual influence among conce
pts. Together our proposed method dubbed DisenDiff can learn disentangled multip
le concepts from one single image and produce novel customized images with learn
ed concepts. We demonstrate that our method outperforms the current state of the
 art in both qualitative and quantitative evaluations. More importantly our prop
osed techniques are compatible with LoRA and inpainting pipelines enabling more
interactive experiences.

ProMark: Proactive Diffusion Watermarking for Causal Attribution
Vishal Asnani, John Collomosse, Tu Bui, Xiaoming Liu, Shruti Agarwal; Proceeding
s of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR),
2024, pp. 10802-10811
Generative AI (GenAI) is transforming creative workflows through the capability
to synthesize and manipulate images via high-level prompts. Yet creatives are no
t well supported to receive recognition or reward for the use of their content i
n GenAI training. To this end we propose ProMark a causal attribution technique
to attribute a synthetically generated image to its training data concepts like
objects motifs templates artists or styles. The concept information is proactive
ly embedded into the input training images using imperceptible watermarks and th
e diffusion models (unconditional or conditional) are trained to retain the corr
esponding watermarks in generated images. We show that we can embed as many as 2
^ 16 unique watermarks into the training data and each training image can conta
in more than one watermark. ProMark can maintain image quality whilst outperform
ing correlation-based attribution. Finally several qualitative examples are pres
ented providing the confidence that the presence of the watermark conveys a caus
ative relationship between training data and synthetic images.

One-Shot Structure-Aware Stylized Image Synthesis
Hansam Cho, Jonghyun Lee, Seunggyu Chang, Yonghyun Jeong; Proceedings of the IEE
E/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 83
02-8311
While GAN-based models have been successful in image stylization tasks they ofte
n struggle with structure preservation while stylizing a wide range of input ima
ges. Recently diffusion models have been adopted for image stylization but still
 lack the capability to maintain the original quality of input images. Building
on this we propose OSASIS: a novel one-shot stylization method that is robust in
 structure preservation. We show that OSASIS is able to effectively disentangle
the semantics from the structure of an image allowing it to control the level of
 content and style implemented to a given input. We apply OSASIS to various expe
rimental settings including stylization with out-of-domain reference images and
stylization with text-driven manipulation. Results show that OSASIS outperforms
other stylization methods especially for input images that were rarely encounter
ed during training providing a promising solution to stylization via diffusion m
odels.

GPT4Point: A Unified Framework for Point-Language Understanding and Generation
Zhangyang Qi, Ye Fang, Zeyi Sun, Xiaoyang Wu, Tong Wu, Jiaqi Wang, Dahua Lin, He
ngshuang Zhao; Proceedings of the IEEE/CVF Conference on Computer Vision and Pat
tern Recognition (CVPR), 2024, pp. 26417-26427
Multimodal Large Language Models (MLLMs) have excelled in 2D image-text comprehe

nsion and image generation but their understanding of the 3D world is notably de
ficient limiting progress in 3D language understanding and generation. To solve
this problem we introduce GPT4Point an innovative groundbreaking point-language
multimodal model designed specifically for unified 3D object understanding and g
eneration within the MLLM framework. GPT4Point as a powerful 3D MLLM seamlessly
can execute a variety of point-text reference tasks such as point-cloud captioni
ng and Q&A. Additionally GPT4Point is equipped with advanced capabilities for co
ntrollable 3D generation it can get high-quality results through a low-quality p
oint-text feature maintaining the geometric shapes and colors. To support the ex
pansive needs of 3D object-text pairs we develop Pyramid-XL a point-language dat
aset annotation engine. It constructs a large-scale database over 1M objects of
varied text granularity levels from the Objaverse-XL dataset essential for train
ing GPT4Point. A comprehensive benchmark has been proposed to evaluate 3D point-
language understanding capabilities. In extensive evaluations GPT4Point has demo
nstrated superior performance in understanding and generation.
****
SemCity: Semantic Scene Generation with Triplane Diffusion
Jumin Lee, Sebin Lee, Changho Jo, Woobin Im, Juhyeong Seon, Sung-Eui Yoon; Proce
edings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CV
PR), 2024, pp. 28337-28347
We present "SemCity" a 3D diffusion model for semantic scene generation in real-
world outdoor environments. Most 3D diffusion models focus on generating a singl
e object synthetic indoor scenes or synthetic outdoor scenes while the generatio
n of real-world outdoor scenes is rarely addressed. In this paper we concentrate
on generating a real-outdoor scene through learning a diffusion model on a real
-world outdoor dataset. In contrast to synthetic data real-outdoor datasets ofte
n contain more empty spaces due to sensor limitations causing challenges in lear
ning real-outdoor distributions. To address this issue we exploit a triplane rep
resentation as a proxy form of scene distributions to be learned by our diffusio
n model. Furthermore we propose a triplane manipulation that integrates seamless
ly with our triplane diffusion model. The manipulation improves our diffusion mo
del's applicability in a variety of downstream tasks related to outdoor scene ge
neration such as scene inpainting scene outpainting and semantic scene completio
n refinements. In experimental results we demonstrate that our triplane diffusio
n model shows meaningful generation results compared with existing work in a rea
l-outdoor dataset SemanticKITTI. We also show our triplane manipulation facilita
tes seamlessly adding removing or modifying objects within a scene. Further it a
lso enables the expansion of scenes toward a city-level scale. Finally we evalua
te our method on semantic scene completion refinements where our diffusion model
enhances predictions of semantic scene completion networks by learning scene di
stribution. Our code is available at https://github.com/zoomin-lee/SemCity.

Improving Semantic Correspondence with Viewpoint-Guided Spherical Maps
Octave Mariotti, Oisin Mac Aodha, Hakan Bilen; Proceedings of the IEEE/CVF Confe
rence on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 19521-19530
Recent self-supervised models produce visual features that are not only effectiv
e at encoding image-level but also pixel-level semantics. They have been reporte
d to obtain impressive results for dense visual semantic correspondence estimati
on even outperforming fully-supervised methods. Nevertheless these models still
fail in the presence of challenging image characteristics such as symmetries and
repeated parts. To address these limitations we propose a new semantic correspo
ndence estimation method that supplements state-of-the-art self-supervised featu
res with 3D understanding via a weak geometric spherical prior. Compared to more
involved 3D pipelines our model provides a simple and effective way of injectin
g informative geometric priors into the learned representation while requiring o
nly weak viewpoint information. We also propose a new evaluation metric that bet
ter accounts for repeated part and symmetry-induced mistakes. We show that our m
ethod succeeds in distinguishing between symmetric views and repeated parts acro
ss many object categories in the challenging SPair-71k dataset and also in gener
alizing to previously unseen classes in the AwA dataset.

MR-VNet: Media Restoration using Volterra Networks
Siddharth Roheda, Amit Unde, Loay Rashid; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 6098-6107
This research paper presents a novel class of restoration network architecture based on the Volterra series formulation. By incorporating non-linearity into the system response function through higher order convolutions instead of traditional activation functions we introduce a general framework for image/video restoration. Through extensive experimentation we demonstrate that our proposed architecture achieves state-of-the-art (SOTA) performance in the field of Image/Video Restoration. Moreover we establish that the recently introduced Non-Linear Activation Free Network (NAF-NET) can be considered a special case within the broader class of Volterra Neural Networks. These findings highlight the potential of Volterra Neural Networks as a versatile and powerful tool for addressing complex restoration tasks in computer vision.

Dual Memory Networks: A Versatile Adaptation Approach for Vision-Language Models
Yabin Zhang, Wenjie Zhu, Hui Tang, Zhiyuan Ma, Kaiyang Zhou, Lei Zhang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 28718-28728
With the emergence of pre-trained vision-language models like CLIP how to adapt them to various downstream classification tasks has garnered significant attention in recent research. The adaptation strategies can be typically categorized into three paradigms: zero-shot adaptation few-shot adaptation and the recently-proposed training-free few-shot adaptation. Most existing approaches are tailored for a specific setting and can only cater to one or two of these paradigms. In this paper we introduce a versatile adaptation approach that can effectively work under all three settings. Specifically we propose the dual memory networks that comprise dynamic and static memory components. The static memory caches training data knowledge enabling training-free few-shot adaptation while the dynamic memory preserves historical test features online during the testing process allowing for the exploration of additional data insights beyond the training set. This novel capability enhances model performance in the few-shot setting and enables model usability in the absence of training data. The two memory networks employ the same flexible memory interactive strategy which can operate in a training-free mode and can be further enhanced by incorporating learnable projection layers. Our approach is tested across 11 datasets under the three task settings. Remarkably in the zero-shot scenario it outperforms existing methods by over 3% and even shows superior results against methods utilizing external training data. Additionally our method exhibits robust performance against natural distribution shifts.

Single Mesh Diffusion Models with Field Latents for Texture Generation
Thomas W. Mitchel, Carlos Esteves, Ameesh Makadia; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 7953-7963
We introduce a framework for intrinsic latent diffusion models operating directly on the surfaces of 3D shapes with the goal of synthesizing high-quality textures. Our approach is underpinned by two contributions: Field Latents a latent representation encoding textures as discrete vector fields on the mesh vertices and Field Latent Diffusion Models which learn to denoise a diffusion process in the learned latent space on the surface. We consider a single-textured-mesh paradigm where our models are trained to generate variations of a given texture on a mesh. We show the synthesized textures are of superior fidelity compared those from existing single-textured-mesh generative models. Our models can also be adapted for user-controlled editing tasks such as inpainting and label-guided generation. The efficacy of our approach is due in part to the equivariance of our proposed framework under isometries allowing our models to seamlessly reproduce details across locally similar regions and opening the door to a notion of generative texture transfer. Code and visualizations are available at https://single-mesh-diffusion.github.io/.

LION: Empowering Multimodal Large Language Model with Dual-Level Visual Knowledg
e
Gongwei Chen, Leyang Shen, Rui Shao, Xiang Deng, Liqiang Nie; Proceedings of the
IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp
. 26540-26550
Multimodal Large Language Models (MLLMs) have endowed LLMs with the ability to p
erceive and understand multi-modal signals. However most of the existing MLLMs m
ainly adopt vision encoders pretrained on coarsely aligned image-text pairs lead
ing to insufficient extraction and reasoning of visual knowledge. To address thi
s issue we devise a dual-Level vIsual knOwledge eNhanced Multimodal Large Langua
ge Model (LION) which empowers the MLLM by injecting visual knowledge in two lev
els. 1) Progressive incorporation of fine-grained spatial-aware visual knowledge
. We design a vision aggregator cooperated with region-level vision-language (VL
) tasks to incorporate fine-grained spatial-aware visual knowledge into the MLLM
. To alleviate the conflict between image-level and region-level VL tasks during
incorporation we devise a dedicated stage-wise instruction-tuning strategy with
mixture-of-adapters. This progressive incorporation scheme contributes to the m
utual promotion between these two kinds of VL tasks. 2) Soft prompting of high-l
evel semantic visual evidence. We facilitate the MLLM with high-level semantic v
isual evidence by leveraging diverse image tags. To mitigate the potential influ
ence caused by imperfect predicted tags we propose a soft prompting method by em
bedding a learnable token into the tailored text instruction. Comprehensive expe
riments on several multi-modal benchmarks demonstrate the superiority of our mod
el (e.g. improvement of 5% accuracy on VSR and 3% CIDEr on TextCaps over Instruc
tBLIP 5% accuracy on RefCOCOg over Kosmos-2).

Learning to Select Views for Efficient Multi-View Understanding
Yunzhong Hou, Stephen Gould, Liang Zheng; Proceedings of the IEEE/CVF Conference
on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 20135-20144
Multiple camera view (multi-view) setups have proven useful in many computer vis
ion applications. However the high computational cost associated with multiple v
iews creates a significant challenge for end devices with limited computational
resources. In modern CPU pipelining breaks a longer job into steps and enables p
arallelism over sequential steps from multiple jobs. Inspired by this we study s
elective view pipelining for efficient multi-view understanding which breaks com
putation of multiple views into steps and only computes the most helpful views/s
teps in a parallel manner for the best efficiency. To this end we use reinforcem
ent learning to learn a very light view selection module that analyzes the targe
t object or scenario from initial views and selects the next-best-view for recog
nition or detection for pipeline computation. Experimental results on multi-view
classification and detection tasks show that our approach achieves promising pe
rformance while using only 2 or 3 out of N available views significantly reducin
g computational costs while maintaining parallelism over GPU through selective v
iew pipelining.

Consistency and Uncertainty: Identifying Unreliable Responses From Black-Box Vis
ion-Language Models for Selective Visual Question Answering
Zaid Khan, Yun Fu; Proceedings of the IEEE/CVF Conference on Computer Vision and
Pattern Recognition (CVPR), 2024, pp. 10854-10863
The goal of selective prediction is to allow an a model to abstain when it may n
ot be able to deliver a reliable prediction which is important in safety-critica
l contexts. Existing approaches to selective prediction typically require access
to the internals of a model require retraining a model or study only unimodal m
odels. However the most powerful models (e.g. GPT-4) are typically only availabl
e as black boxes with inaccessible internals are not retrainable by end-users an
d are frequently used for multimodal tasks. We study the possibility of selectiv
e prediction for vision-language models in a realistic black-box setting. We pro
pose using the principle of neighborhood consistency to identify unreliable resp
onses from a black-box vision-language model in question answering tasks. We hyp

othesize that given only a visual question and model response the consistency of the model's responses over the neighborhood of a visual question will indicate reliability. It is impossible to directly sample neighbors in feature space in a black-box setting. Instead we show that it is possible to use a smaller proxy model to approximately sample from the neighborhood. We find that neighborhood consistency can be used to identify model responses to visual questions that are likely unreliable even in adversarial settings or settings that are out-of-distribution to the proxy model.

SAI3D: Segment Any Instance in 3D Scenes
Yingda Yin, Yuzheng Liu, Yang Xiao, Daniel Cohen-Or, Jingwei Huang, Baoquan Chen; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 3292-3302
Advancements in 3D instance segmentation have traditionally been tethered to the availability of annotated datasets limiting their application to a narrow spectrum of object categories. Recent efforts have sought to harness vision-language models like CLIP for open-set semantic reasoning yet these methods struggle to distinguish between objects of the same categories and rely on specific prompts that are not universally applicable. In this paper we introduce SAI3D a novel zero-shot 3D instance segmentation approach that synergistically leverages geometric priors and semantic cues derived from Segment Anything Model (SAM). Our method partitions a 3D scene into geometric primitives which are then progressively merged into 3D instance segmentations that are consistent with the multi-view SAM masks. Moreover we design a hierarchical region-growing algorithm with a dynamic thresholding mechanism which largely improves the robustness of fine-grained 3D scene parsing. Empirical evaluations on ScanNet Matterport3D and the more challenging ScanNet++ datasets demonstrate the superiority of our approach. Notably SAI3D outperforms existing open-vocabulary baselines and even surpasses fully-supervised methods in class-agnostic segmentation on ScanNet++. Our project page is at https://yd-yin.github.io/SAI3D/.
****
Implicit Motion Function
Yue Gao, Jiahao Li, Lei Chu, Yan Lu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 19278-19289
Recent advancements in video modeling extensively rely on optical flow to represent the relationships across frames but this approach often lacks efficiency and fails to model the probability of the intrinsic motion of objects. In addition conventional encoder-decoder frameworks in video processing focus on modeling the correlation in the encoder leading to limited generative capabilities and redundant intermediate representations. To address these challenges this paper proposes a novel Implicit Motion Function (IMF) method. Our approach utilizes a low-dimensional latent token as the implicit representation along with the use of cross-attention to implicitly model the correlation between frames. This enables the implicit modeling of temporal correlations and understanding of object motions. Our method not only improves sparsity and efficiency in representation but also explores the generative capabilities of the decoder by integrating correlation modeling within it. The IMF framework facilitates video editing and other generative tasks by allowing the direct manipulation of latent tokens. We validate the effectiveness of IMF through extensive experiments on multiple video tasks demonstrating superior performance in terms of reconstructed video quality compression efficiency and generation ability.
****
Unified Entropy Optimization for Open-Set Test-Time Adaptation
Zhengqing Gao, Xu-Yao Zhang, Cheng-Lin Liu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 23975-23984
Test-time adaptation (TTA) aims at adapting a model pre-trained on the labeled source domain to the unlabeled target domain. Existing methods usually focus on improving TTA performance under covariate shifts while neglecting semantic shifts. In this paper we delve into a realistic open-set TTA setting where the target domain may contain samples from unknown classes. Many state-of-the-art closed-se

t TTA methods perform poorly when applied to open-set scenarios which can be att
ributed to the inaccurate estimation of data distribution and model confidence.
To address these issues we propose a simple but effective framework called unifi
ed entropy optimization (UniEnt) which is capable of simultaneously adapting to
covariate-shifted in-distribution (csID) data and detecting covariate-shifted ou
t-of-distribution (csOOD) data. Specifically UniEnt first mines pseudo-csID and
pseudo-csOOD samples from test data followed by entropy minimization on the pseu
do-csID data and entropy maximization on the pseudo-csOOD data. Furthermore we i
ntroduce UniEnt+ to alleviate the noise caused by hard data partition leveraging
 sample-level confidence. Extensive experiments on CIFAR benchmarks and Tiny-Ima
geNet-C show the superiority of our framework. The code is available at https://
github.com/gaozhengqing/UniEnt.

TexOct: Generating Textures of 3D Models with Octree-based Diffusion
Jialun Liu, Chenming Wu, Xinqi Liu, Xing Liu, Jinbo Wu, Haotian Peng, Chen Zhao,
 Haocheng Feng, Jingtuo Liu, Errui Ding; Proceedings of the IEEE/CVF Conference
on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 4284-4293
This paper focuses on synthesizing high-quality and complete textures directly o
n the surface of 3D models within 3D space. 2D diffusion-based methods face chal
lenges in generating 2D texture maps due to the infinite possibilities of UV map
ping for a given 3D mesh. Utilizing point clouds helps circumvent variations ari
sing from diverse mesh topologies and UV mappings. Nevertheless achieving dense
point clouds to accurately represent texture details poses a challenge due to li
mited computational resources. To address these challenges we propose an efficie
nt octree-based diffusion pipeline called TexOct. Our method starts by sampling
a point cloud from the surface of a given 3D model with each point containing te
xture noise values. We utilize an octree structure to efficiently represent this
 point cloud. Additionally we introduce an innovative octree-based diffusion mod
el that leverages the denoising capabilities of the Denoising Diffusion Probabil
istic Model (DDPM). This model gradually reduces the texture noise on the octree
 nodes resulting in the restoration of fine texture. Experimental results on Sha
peNet demonstrate that TexOct effectively generates high-quality 3D textures in
both unconditional and text / image-conditional scenarios.

Anatomically Constrained Implicit Face Models
Prashanth Chandran, Gaspard Zoss; Proceedings of the IEEE/CVF Conference on Comp
uter Vision and Pattern Recognition (CVPR), 2024, pp. 2220-2229
Coordinate based implicit neural representations have gained rapid popularity in
 recent years as they have been successfully used in image geometry and scene mo
deling tasks. In this work we present a novel use case for such implicit represe
ntations in the context of learning anatomically constrained face models. Actor
specific anatomically constrained face models are the state of the art in both f
acial performance capture and performance retargeting. Despite their practical s
uccess these anatomical models are slow to evaluate and often require extensive
data capture to be built. We propose the anatomical implicit face model; an ense
mble of implicit neural networks that jointly learn to model the facial anatomy
and the skin surface with high-fidelity and can readily be used as a drop in rep
lacement to conventional blendshape models. Given an arbitrary set of skin surfa
ce meshes of an actor and only a neutral shape with estimated skull and jaw bone
s our method can recover a dense anatomical substructure which constrains every
point on the facial surface. We demonstrate the usefulness of our approach in se
veral tasks ranging from shape fitting shape editing and performance retargeting
.

Expandable Subspace Ensemble for Pre-Trained Model-Based Class-Incremental Learn
ing
Da-Wei Zhou, Hai-Long Sun, Han-Jia Ye, De-Chuan Zhan; Proceedings of the IEEE/CV
F Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 23554-
23564
Class-Incremental Learning (CIL) requires a learning system to continually learn

new classes without forgetting. Despite the strong performance of Pre-Trained Models (PTMs) in CIL a critical issue persists: learning new classes often results in the overwriting of old ones. Excessive modification of the network causes forgetting while minimal adjustments lead to an inadequate fit for new classes. As a result it is desired to figure out a way of efficient model updating without harming former knowledge. In this paper we propose ExpAndable Subspace Ensemble (EASE) for PTM-based CIL. To enable model updating without conflict we train a distinct lightweight adapter module for each new task aiming to create task-specific subspaces. These adapters span a high-dimensional feature space enabling joint decision-making across multiple subspaces. As data evolves the expanding subspaces render the old class classifiers incompatible with new-stage spaces. Correspondingly we design a semantic-guided prototype complement strategy that synthesizes old classes' new features without using any old class instance. Extensive experiments on seven benchmark datasets verify EASE's state-of-the-art performance. Code is available at: https://github.com/sun-hailong/CVPR24-Ease

Capturing Closely Interacted Two-Person Motions with Reaction Priors
Qi Fang, Yinghui Fan, Yanjun Li, Junting Dong, Dingwei Wu, Weidong Zhang, Kang Chen; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 655-665
In this paper we focus on capturing closely interacted two-person motions from monocular videos an important yet understudied topic. Unlike less-interacted motions closely interacted motions contain frequently occurring inter-human occlusions which pose significant challenges to existing capturing algorithms. To address this problem our key observation is that close physical interactions between two subjects typically happen under very specific situations (e.g. handshake hug etc.) and such situational contexts contain strong prior semantics to help infer the poses of occluded joints. In this spirit we introduce reaction priors which are invertible neural networks that bi-directionally model the pose probability distributions of one person given the pose of the other. The learned reaction priors are then incorporated into a query-based pose estimator which is a decoder-only Transformer with self-attentions on both intra-joint and inter-joint relationships. We demonstrate that our design achieves considerably higher performance than previous methods on multiple benchmarks. What's more as existing datasets lack sufficient cases of close human-human interactions we also build a new dataset called Dual-Human to better evaluate different methods. Dual-Human contains around 2k sequences of closely interacted two-person motions each with synthetic multi-view renderings contact annotations and text descriptions. We believe that this new public dataset can significantly promote further research in this area.

RobustSAM: Segment Anything Robustly on Degraded Images
Wei-Ting Chen, Yu-Jiet Vong, Sy-Yen Kuo, Sizhou Ma, Jian Wang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 4081-4091
Segment Anything Model (SAM) has emerged as a transformative approach in image segmentation acclaimed for its robust zero-shot segmentation capabilities and flexible prompting system. Nonetheless its performance is challenged by images with degraded quality. Addressing this limitation we propose the Robust Segment Anything Model (RobustSAM) which enhances SAM's performance on low-quality images while preserving its promptability and zero-shot generalization. Our method leverages the pre-trained SAM model with only marginal parameter increments and computational requirements. The additional parameters of RobustSAM can be optimized within 30 hours on eight GPUs demonstrating its feasibility and practicality for typical research laboratories. We also introduce the Robust-Seg dataset a collection of 688K image-mask pairs with different degradations designed to train and evaluate our model optimally. Extensive experiments across various segmentation tasks and datasets confirm RobustSAM's superior performance especially under zero-shot conditions underscoring its potential for extensive real-world application. Additionally our method has been shown to effectively improve the performance

of SAM-based downstream tasks such as single image dehazing and deblurring.

MultiDiff: Consistent Novel View Synthesis from a Single Image
Norman Müller, Katja Schwarz, Barbara Rössle, Lorenzo Porzi, Samuel Rota Bulò, Matthias Nießner, Peter Kontschieder; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 10258-10268
We introduce MultiDiff a novel approach for consistent novel view synthesis of scenes from a single RGB image. The task of synthesizing novel views from a single reference image is highly ill-posed by nature as there exist multiple plausible explanations for unobserved areas. To address this issue we incorporate strong priors in form of monocular depth predictors and video-diffusion models. Monocular depth enables us to condition our model on warped reference images for the target views increasing geometric stability. The video-diffusion prior provides a strong proxy for 3D scenes allowing the model to learn continuous and pixel-accurate correspondences across generated images. In contrast to approaches relying on autoregressive image generation that are prone to drifts and error accumulation MultiDiff jointly synthesizes a sequence of frames yielding high-quality and multi-view consistent results -- even for long-term scene generation with large camera movements while reducing inference time by an order of magnitude. For additional consistency and image quality improvements we introduce a novel structured noise distribution. Our experimental results demonstrate that MultiDiff outperforms state-of-the-art methods on the challenging real-world datasets RealEstate10K and ScanNet. Finally our model naturally supports multi-view consistent editing without the need for further tuning.

In-N-Out: Faithful 3D GAN Inversion with Volumetric Decomposition for Face Editing
Yiran Xu, Zhixin Shu, Cameron Smith, Seoung Wug Oh, Jia-Bin Huang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 7225-7235
3D-aware GANs offer new capabilities for view synthesis while preserving the editing functionalities of their 2D counterparts. GAN inversion is a crucial step that seeks the latent code to reconstruct input images or videos subsequently enabling diverse editing tasks through manipulation of this latent code. However a model pre-trained on a particular dataset (e.g. FFHQ) often has difficulty reconstructing images with out-of-distribution (OOD) objects such as faces with heavy make-up or occluding objects. We address this issue by explicitly modeling OOD objects from the input in 3D-aware GANs. Our core idea is to represent the image using two individual neural radiance fields: one for the in-distribution content and the other for the out-of-distribution object. The final reconstruction is achieved by optimizing the composition of these two radiance fields with carefully designed regularization. We demonstrate that our explicit decomposition alleviates the inherent trade-off between reconstruction fidelity and editability. We evaluate reconstruction accuracy and editability of our method on challenging real face images and videos and showcase favorable results against other baselines.

Atom-Level Optical Chemical Structure Recognition with Limited Supervision
Martijn Oldenhof, Edward De Brouwer, Adam Arany, Yves Moreau; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 17669-17678
Identifying the chemical structure from a graphical representation or image of a molecule is a challenging pattern recognition task that would greatly benefit drug development. Yet existing methods for chemical structure recognition do not typically generalize well and show diminished effectiveness when confronted with domains where data is sparse or costly to generate such as hand-drawn molecule images. To address this limitation we propose a new chemical structure recognition tool that delivers state-of-the-art performance and can adapt to new domains with a limited number of data samples and supervision. Unlike previous approaches our method provides atom-level localization and can therefore segment the imag

e into the different atoms and bonds. Our model is the first model to perform OCSR with atom-level entity detection with only SMILES supervision. Through rigorous and extensive benchmarking we demonstrate the preeminence of our chemical structure recognition approach in terms of data efficiency accuracy and atom-level entity prediction.

L4D-Track: Language-to-4D Modeling Towards 6-DoF Tracking and Shape Reconstruction in 3D Point Cloud Stream
Jingtao Sun, Yaonan Wang, Mingtao Feng, Yulan Guo, Ajmal Mian, Mike Zheng Shou; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 21146-21156
3D visual language multi-modal modeling plays an important role in actual human-computer interaction. However the inaccessibility of large-scale 3D-language pairs restricts their applicability in real-world scenarios. In this paper we aim to handle a real-time multi-task for 6-DoF pose tracking of unknown objects leveraging 3D-language pre-training scheme from a series of 3D point cloud video streams while simultaneously performing 3D shape reconstruction in current observation. To this end we present a generic Language-to-4D modeling paradigm termed L4D-Track that tackles zero-shot 6-DoF \underline Track ing and shape reconstruction by learning pairwise implicit 3D representation and multi-level multi-modal alignment. Our method constitutes two core parts. 1) Pairwise Implicit 3D Space Representation that establishes spatial-temporal to language coherence descriptions across continuous 3D point cloud video. 2) Language-to-4D Association and Contrastive Alignment enables multi-modality semantic connections between 3D point cloud video and language. Our method trained exclusively on public NOCS-REAL275 dataset achieves promising results on both two publicly benchmarks. This not only shows powerful generalization performance but also proves its remarkable capability in zero-shot inference.

General Point Model Pretraining with Autoencoding and Autoregressive
Zhe Li, Zhangyang Gao, Cheng Tan, Bocheng Ren, Laurence T. Yang, Stan Z. Li; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 20954-20964
The pre-training architectures of large language models encompass various types including autoencoding models autoregressive models and encoder-decoder models. We posit that any modality can potentially benefit from a large language model as long as it undergoes vector quantization to become discrete tokens. Inspired by the General Language Model we propose a General Point Model (GPM) that seamlessly integrates autoencoding and autoregressive tasks in a point cloud transformer. This model is versatile allowing fine-tuning for downstream point cloud representation tasks as well as unconditional and conditional generation tasks. GPM enhances masked prediction in autoencoding through various forms of mask padding tasks leading to improved performance in point cloud understanding. Additionally GPM demonstrates highly competitive results in unconditional point cloud generation tasks even exhibiting the potential for conditional generation tasks by modifying the input's conditional information. Compared to models like Point-BERT MaskPoint and PointMAE our GPM achieves superior performance in point cloud understanding tasks. Furthermore the integration of autoregressive and autoencoding within the same transformer underscores its versatility across different downstream tasks.

Combining Frame and GOP Embeddings for Neural Video Representation
Jens Eirik Saethre, Roberto Azevedo, Christopher Schroers; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 9253-9263
Implicit neural representations (INRs) were recently proposed as a new video compression paradigm with existing approaches performing on par with HEVC. However such methods only perform well in limited settings e.g. specific model sizes fixed aspect ratios and low-motion videos. We address this issue by proposing T-NeRV a hybrid video INR that combines frame-specific embeddings with GOP-specific f

eatures providing a lever for content-specific fine-tuning. We employ entropy-co nstrained training to jointly optimize our model for rate and distortion and dem onstrate that T-NeRV can thereby automatically adjust this lever during training effectively fine-tuning itself to the target content. We evaluate T-NeRV on the UVG dataset where it achieves state-of-the-art results on the video representat ion task outperforming previous works by up to 3dB PSNR on challenging high-moti on sequences. Further our method improves on the compression performance of prev ious methods and is the first video INR to outperform HEVC on all UVG sequences.

LiDAR-based Person Re-identification
Wenxuan Guo, Zhiyu Pan, Yingping Liang, Ziheng Xi, Zhicheng Zhong, Jianjiang Fen g, Jie Zhou; Proceedings of the IEEE/CVF Conference on Computer Vision and Patte rn Recognition (CVPR), 2024, pp. 17437-17447
Camera-based person re-identification (ReID) systems have been widely applied in the field of public security. However cameras often lack the perception of 3D m orphological information of human and are susceptible to various limitations suc h as inadequate illumination complex background and personal privacy. In this pa per we propose a LiDAR-based ReID framework ReID3D that utilizes pre-training st rategy to retrieve features of 3D body shape and introduces Graph-based Compleme ntary Enhancement Encoder for extracting comprehensive features. Due to the lack of LiDAR datasets we build LReID the first LiDAR-based person ReID dataset whic h is collected in several outdoor scenes with variations in natural conditions. Additionally we introduce LReID-sync a simulated pedestrian dataset designed for pre-training encoders with tasks of point cloud completion and shape parameter learning. Extensive experiments on LReID show that ReID3D achieves exceptional p erformance with a rank-1 accuracy of 94.0 highlighting the significant potential of LiDAR in addressing person ReID tasks. To the best of our knowledge we are t he first to propose a solution for LiDAR-based ReID. The code and dataset are av ailable at https://github.com/GWxuan/ReID3D.

Fantastic Animals and Where to Find Them: Segment Any Marine Animal with Dual SA M
Pingping Zhang, Tianyu Yan, Yang Liu, Huchuan Lu; Proceedings of the IEEE/CVF Co nference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 2578-2587
As an important pillar of underwater intelligence Marine Animal Segmentation (MA S) involves segmenting animals within marine environments. Previous methods don' t excel in extracting long-range contextual features and overlook the connectivi ty between discrete pixels. Recently Segment Anything Model (SAM) offers a unive rsal framework for general segmentation tasks. Unfortunately trained with natura l images SAM does not obtain the prior knowledge from marine images. In addition the single-position prompt of SAM is very insufficient for prior guidance. To a ddress these issues we propose a novel feature learning framework named Dual-SAM for high-performance MAS. To this end we first introduce a dual structure with SAM's paradigm to enhance feature learning of marine images. Then we propose a M ulti-level Coupled Prompt (MCP) strategy to instruct comprehensive underwater pr ior information and enhance the multi-level features of SAM's encoder with adapt ers. Subsequently we design a Dilated Fusion Attention Module (DFAM) to progress ively integrate multi-level features from SAM's encoder. Finally instead of dire ctly predicting the masks of marine animals we propose a Criss-Cross Connectivit y Prediction (C3P) paradigm to capture the inter-connectivity between discrete p ixels. With dual decoders it generates pseudo-labels and achieves mutual supervi sion for complementary feature representations resulting in considerable improve ments over previous techniques. Extensive experiments verify that our proposed m ethod achieves state-of-the-art performances on five widely-used MAS datasets. T he code is available at https://github.com/Drchip61/Dual SAM.

Seeing and Hearing: Open-domain Visual-Audio Generation with Diffusion Latent Al igners
Yazhou Xing, Yingqing He, Zeyue Tian, Xintao Wang, Qifeng Chen; Proceedings of t he IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024,

pp. 7151-7161
Video and audio content creation serves as the core technique for the movie industry and professional users. Recently existing diffusion-based methods tackle video and audio generation separately which hinders the technique transfer from academia to industry. In this work we aim at filling the gap with a carefully designed optimization-based framework for cross-visual-audio and joint-visual-audio generation. We observe the powerful generation ability of off-the-shelf video or audio generation models. Thus instead of training the giant models from scratch we propose to bridge the existing strong models with a shared latent representation space. Specifically we propose a multimodality latent aligner with the pre-trained ImageBind model. Our latent aligner shares a similar core as the classifier guidance that guides the diffusion denoising process during inference time. Through carefully designed optimization strategy and loss functions we show the superior performance of our method on joint video-audio generation visual-steered audio generation and audio-steered visual generation tasks. The project website can be found at \href https://yzxing87.github.io/Seeing-and-Hearing/ https://yzxing87.github.io/Seeing-and-Hearing/ .

Model Adaptation for Time Constrained Embodied Control
Jaehyun Song, Minjong Yoo, Honguk Woo; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 16499-16508
When adopting a deep learning model for embodied agents it is required that the model structure be optimized for specific tasks and operational conditions. Such optimization can be static such as model compression or dynamic such as adaptive inference. Yet these techniques have not been fully investigated for embodied control systems subject to time constraints which necessitate sequential decision-making for multiple tasks each with distinct inference latency limitations. In this paper we present MoDeC a time constraint-aware embodied control framework using the modular model adaptation. We formulate model adaptation to varying operational conditions on resource and time restrictions as dynamic routing on a modular network incorporating these conditions as part of multi-task objectives. Our evaluation across several vision-based embodied environments demonstrates the robustness of MoDeC showing that it outperforms other model adaptation methods in both performance and adherence to time constraints in robotic manipulation and autonomous driving applications.

Objects as Volumes: A Stochastic Geometry View of Opaque Solids
Bailey Miller, Hanyu Chen, Alice Lai, Ioannis Gkioulekas; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 87-97
We develop a theory for the representation of opaque solids as volumes. Starting from a stochastic representation of opaque solids as random indicator functions we prove the conditions under which such solids can be modeled using exponential volumetric transport. We also derive expressions for the volumetric attenuation coefficient as a functional of the probability distributions of the underlying indicator functions. We generalize our theory to account for isotropic and anisotropic scattering at different parts of the solid and for representations of opaque solids as stochastic implicit surfaces. We derive our volumetric representation from first principles which ensures that it satisfies physical constraints such as reciprocity and reversibility. We use our theory to explain compare and correct previous volumetric representations as well as propose meaningful extensions that lead to improved performance in 3D reconstruction tasks.

ActiveDC: Distribution Calibration for Active Finetuning
Wenshuai Xu, Zhenghui Hu, Yu Lu, Jinzhou Meng, Qingjie Liu, Yunhong Wang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 16996-17005
The pretraining-finetuning paradigm has gained popularity in various computer vision tasks. In this paradigm the emergence of active finetuning arises due to the abundance of large-scale data and costly annotation requirements. Active finet

uning involves selecting a subset of data from an unlabeled pool for annotation facilitating subsequent finetuning. However the use of a limited number of training samples can lead to a biased distribution potentially resulting in model overfitting. In this paper we propose a new method called ActiveDC for the active finetuning tasks. Firstly we select samples for annotation by optimizing the distribution similarity between the subset to be selected and the entire unlabeled pool in continuous space. Secondly we calibrate the distribution of the selected samples by exploiting implicit category information in the unlabeled pool. The feature visualization provides an intuitive sense of the effectiveness of our approach to distribution calibration. We conducted extensive experiments on three image classification datasets with different sampling ratios. The results indicate that ActiveDC consistently outperforms the baseline performance in all image classification tasks. The improvement is particularly significant when the sampling ratio is low with performance gains of up to 10%. Our code will be released.

Seeing Unseen: Discover Novel Biomedical Concepts via Geometry-Constrained Probabilistic Modeling
Jianan Fan, Dongnan Liu, Hang Chang, Heng Huang, Mei Chen, Weidong Cai; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 11524-11534
Machine learning holds tremendous promise for transforming the fundamental practice of scientific discovery by virtue of its data-driven nature. With the ever-increasing stream of research data collection it would be appealing to autonomously explore patterns and insights from observational data for discovering novel classes of phenotypes and concepts. However in the biomedical domain there are several challenges inherently presented in the cumulated data which hamper the progress of novel class discovery. The non-i.i.d. data distribution accompanied by the severe imbalance among different groups of classes essentially leads to ambiguous and biased semantic representations. In this work we present a geometry-constrained probabilistic modeling treatment to resolve the identified issues. First we propose to parameterize the approximated posterior of instance embedding as a marginal von Mises-Fisher distribution to account for the interference of distributional latent bias. Then we incorporate a suite of critical geometric properties to impose proper constraints on the layout of constructed embedding space which in turn minimizes the uncontrollable risk for unknown class learning and structuring. Furthermore a spectral graph-theoretic method is devised to estimate the number of potential novel classes. It inherits two intriguing merits compared to existent approaches namely high computational efficiency and flexibility for taxonomy-adaptive estimation. Extensive experiments across various biomedical scenarios substantiate the effectiveness and general applicability of our method.

MVHumanNet: A Large-scale Dataset of Multi-view Daily Dressing Human Captures
Zhangyang Xiong, Chenghong Li, Kenkun Liu, Hongjie Liao, Jianqiao Hu, Junyi Zhu, Shuliang Ning, Lingteng Qiu, Chongjie Wang, Shijie Wang, Shuguang Cui, Xiaoguang Han; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 19801-19811
In this era the success of large language models and text-to-image models can be attributed to the driving force of large-scale datasets. However in the realm of 3D vision while remarkable progress has been made with models trained on large-scale synthetic and real-captured object data like Objaverse and MVImgNet a similar level of progress has not been observed in the domain of human-centric tasks partially due to the lack of a large-scale human dataset. Existing datasets of high-fidelity 3D human capture continue to be mid-sized due to the significant challenges in acquiring large-scale high-quality 3D human data. To bridge this gap we present MVHumanNet a dataset that comprises multi-view human action sequences of 4500 human identities. The primary focus of our work is on collecting human data that features a large number of diverse identities and everyday clothing using a multi-view human capture system which facilitates easily scalable data collection. Our dataset contains 9000 daily outfits 60000 motion sequences and 6

45 million frames with extensive annotations including human masks camera parameters 2D and 3D keypoints SMPL/SMPLX parameters and corresponding textual descriptions. To explore the potential of MVHumanNet in various 2D and 3D visual tasks we conducted pilot studies on view-consistent action recognition human NeRF reconstruction text-driven view-unconstrained human image generation as well as 2D view-unconstrained human image and 3D avatar generation. Extensive experiments demonstrate the performance improvements and effective applications enabled by the scale provided by MVHumanNet. As the current largest-scale 3D human dataset we hope that the release of MVHumanNet data with annotations will foster further innovations in the domain of 3D human-centric tasks at scale.

Communication-Efficient Federated Learning with Accelerated Client Gradient
Geeho Kim, Jinkyu Kim, Bohyung Han; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 12385-12394
Federated learning often suffers from slow and unstable convergence due to the heterogeneous characteristics of participating client datasets. Such a tendency is aggravated when the client participation ratio is low since the information collected from the clients has large variations. To address this challenge we propose a simple but effective federated learning framework which improves the consistency across clients and facilitates the convergence of the server model. This is achieved by making the server broadcast a global model with a lookahead gradient. This strategy enables the proposed approach to convey the projected global update information to participants effectively without additional client memory and extra communication costs. We also regularize local updates by aligning each client with the overshot global model to reduce bias and improve the stability of our algorithm. We provide the theoretical convergence rate of our algorithm and demonstrate remarkable performance gains in terms of accuracy and communication efficiency compared to the state-of-the-art methods especially with low client participation rates. The source code is available at our project page.
****
LLMs are Good Action Recognizers
Haoxuan Qu, Yujun Cai, Jun Liu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 18395-18406
Skeleton-based action recognition has attracted lots of research attention. Recently to build an accurate skeleton-based action recognizer a variety of works have been proposed. Among them some works use large model architectures as backbones of their recognizers to boost the skeleton data representation capability while some other works pre-train their recognizers on external data to enrich the knowledge. In this work we observe that large language models which have been extensively used in various natural language processing tasks generally hold both large model architectures and rich implicit knowledge. Motivated by this we propose a novel LLM-AR framework in which we investigate treating the Large Language Model as an Action Recognizer. In our framework we propose a linguistic projection process to project each input action signal (i.e. each skeleton sequence) into its "sentence format" (i.e. an "action sentence"). Moreover we also incorporate our framework with several designs to further facilitate this linguistic projection process. Extensive experiments demonstrate the efficacy of our proposed framework.

NoiseCLR: A Contrastive Learning Approach for Unsupervised Discovery of Interpretable Directions in Diffusion Models
Yusuf Dalva, Pinar Yanardag; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 24209-24218
Generative models have been very popular in the recent years for their image generation capabilities. GAN-based models are highly regarded for their disentangled latent space which is a key feature contributing to their success in controlled image editing. On the other hand diffusion models have emerged as powerful tools for generating high-quality images. However the latent space of diffusion models is not as thoroughly explored or understood. Existing methods that aim to explore the latent space of diffusion models usually relies on text prompts to pin

point specific semantics. However this approach may be restrictive in areas such as art fashion or specialized fields like medicine where suitable text prompts might not be available or easy to conceive thus limiting the scope of existing work. In this paper we propose an unsupervised method to discover latent semantics in text-to-image diffusion models without relying on text prompts. Our method takes a small set of unlabeled images from specific domains such as faces or cats and a pre-trained diffusion model and discovers diverse semantics in unsupervised fashion using a contrastive learning objective. Moreover the learned directions can be applied simultaneously either within the same domain (such as various types of facial edits) or across different domains (such as applying cat and face edits within the same image) without interfering with each other. Our extensive experiments show that our method achieves highly disentangled edits outperforming existing approaches in both diffusion-based and GAN-based latent space editing methods.

SpecNeRF: Gaussian Directional Encoding for Specular Reflections
Li Ma, Vasu Agrawal, Haithem Turki, Changil Kim, Chen Gao, Pedro Sander, Michael Zollhöfer, Christian Richardt; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 21188-21198
Neural radiance fields have achieved remarkable performance in modeling the appearance of 3D scenes. However existing approaches still struggle with the view-dependent appearance of glossy surfaces especially under complex lighting of indoor environments. Unlike existing methods which typically assume distant lighting like an environment map we propose a learnable Gaussian directional encoding to better model the view-dependent effects under near-field lighting conditions. Importantly our new directional encoding captures the spatially-varying nature of near-field lighting and emulates the behavior of prefiltered environment maps. As a result it enables the efficient evaluation of preconvolved specular color at any 3D location with varying roughness coefficients. We further introduce a data-driven geometry prior that helps alleviate the shape radiance ambiguity in reflection modeling. We show that our Gaussian directional encoding and geometry prior significantly improve the modeling of challenging specular reflections in neural radiance fields which helps decompose appearance into more physically meaningful components.
****

Improving Subject-Driven Image Synthesis with Subject-Agnostic Guidance
Kelvin C.K. Chan, Yang Zhao, Xuhui Jia, Ming-Hsuan Yang, Huisheng Wang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 6733-6742
In subject-driven text-to-image synthesis the synthesis process tends to be heavily influenced by the reference images provided by users often overlooking crucial attributes detailed in the text prompt. In this work we propose Subject-Agnostic Guidance (SAG) a simple yet effective solution to remedy the problem. We show that through constructing a subject-agnostic condition and applying our proposed dual classifier-free guidance one could obtain outputs consistent with both the given subject and input text prompts. We validate the efficacy of our approach through both optimization-based and encoder-based methods. Additionally we demonstrate its applicability in second-order customization methods where an encoder-based model is fine-tuned with DreamBooth. Our approach is conceptually simple and requires only minimal code modifications but leads to substantial quality improvements as evidenced by our evaluations and user studies.

Diffusion Model Alignment Using Direct Preference Optimization
Bram Wallace, Meihua Dang, Rafael Rafailov, Linqi Zhou, Aaron Lou, Senthil Purushwalkam, Stefano Ermon, Caiming Xiong, Shafiq Joty, Nikhil Naik; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 8228-8238
Large language models (LLMs) are fine-tuned using human comparison data with Reinforcement Learning from Human Feedback (RLHF) methods to make them better aligned with users' preferences. In contrast to LLMs human preference learning has no

t been widely explored in text-to-image diffusion models; the best existing approach is to fine-tune a pretrained model using carefully curated high quality images and captions to improve visual appeal and text alignment. We propose Diffusion-DPO a method to align diffusion models to human preferences by directly optimizing on human comparison data. Diffusion-DPO is adapted from the recently developed Direct Preference Optimization (DPO) a simpler alternative to RLHF which directly optimizes a policy that best satisfies human preferences under a classification objective. We re-formulate DPO to account for a diffusion model notion of likelihood utilizing the evidence lower bound to derive a differentiable objective. Using the Pick-a-pic dataset of 851K crowdsourced pairwise preferences we fine-tune the base model of the state-of-the-art Stable Diffusion XL (SDXL)-1.0 model with Diffusion-DPO. Our fine-tuned base model significantly outperforms both base SDXL-1.0 and the larger SDXL-1.0 model consisting of an additional refinement model in human evaluation improving visual appeal and prompt alignment. We also develop a variant that uses AI feedback and has comparable performance to training on human preferences opening the door for scaling of diffusion model alignment methods.

Interactive Continual Learning: Fast and Slow Thinking

Biqing Qi, Xinquan Chen, Junqi Gao, Dong Li, Jianxing Liu, Ligang Wu, Bowen Zhou; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 12882-12892

Advanced life forms sustained by the synergistic interaction of neural cognitive mechanisms continually acquire and transfer knowledge throughout their lifespan. In contrast contemporary machine learning paradigms exhibit limitations in emulating the facets of continual learning (CL). Nonetheless the emergence of large language models (LLMs) presents promising avenues for realizing CL via interactions with these models. Drawing on Complementary Learning System theory this paper presents a novel Interactive Continual Learning (ICL) framework enabled by collaborative interactions among models of various sizes. Specifically we assign the ViT model as System1 and multimodal LLM as System2. To enable the memory module to deduce tasks from class information and enhance Set2Set retrieval we propose the Class-Knowledge-Task Multi-Head Attention (CKT-MHA). Additionally to improve memory retrieval in System1 through enhanced geometric representation we introduce the CL-vMF mechanism based on the von Mises-Fisher (vMF) distribution. Meanwhile we introduce the von Mises-Fisher Outlier Detection and Interaction (vMF-ODI) strategy to identify hard examples thus enhancing collaboration between System1 and System2 for complex reasoning realization. Comprehensive evaluation of our proposed ICL demonstrates significant resistance to forgetting and superior performance relative to existing methods. Code is available at github.com/ICL.

ZeroNVS: Zero-Shot 360-Degree View Synthesis from a Single Image

Kyle Sargent, Zizhang Li, Tanmay Shah, Charles Herrmann, Hong-Xing Yu, Yunzhi Zhang, Eric Ryan Chan, Dmitry Lagun, Li Fei-Fei, Deqing Sun, Jiajun Wu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 9420-9429

We introduce a 3D-aware diffusion model ZeroNVS for single-image novel view synthesis for in-the-wild scenes. While existing methods are designed for single objects with masked backgrounds we propose new techniques to address challenges introduced by in-the-wild multi-object scenes with complex backgrounds. Specifically we train a generative prior on a mixture of data sources that capture object-centric indoor and outdoor scenes. To address issues from data mixture such as depth-scale ambiguity we propose a novel camera conditioning parameterization and normalization scheme. Further we observe that Score Distillation Sampling (SDS) tends to truncate the distribution of complex backgrounds during distillation of 360-degree scenes and propose "SDS anchoring" to improve the diversity of synthesized novel views. Our model sets a new state-of-the-art result in LPIPS on the DTU dataset in the zero-shot setting even outperforming methods specifically trained on DTU. We further adapt the challenging Mip-NeRF 360 dataset as a new benchmark for single-image novel view synthesis and demonstrate strong performance

in this setting. Code and models will be publicly available.

Restoration by Generation with Constrained Priors
Zheng Ding, Xuaner Zhang, Zhuowen Tu, Zhihao Xia; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 2567-2577
The inherent generative power of denoising diffusion models makes them well-suited for image restoration tasks where the objective is to find the optimal high-quality image within the generative space that closely resembles the input image. We propose a method to adapt a pretrained diffusion model for image restoration by simply adding noise to the input image to be restored and then denoise. Our method is based on the observation that the space of a generative model needs to be constrained. We impose this constraint by finetuning the generative model with a set of anchor images that capture the characteristics of the input image. With the constrained space we can then leverage the sampling strategy used for generation to do image restoration. We evaluate against previous methods and show superior performances on multiple real-world restoration datasets in preserving identity and image quality. We also demonstrate an important and practical application on personalized restoration where we use a personal album as the anchor images to constrain the generative space. This approach allows us to produce results that accurately preserve high-frequency details which previous works are unable to do. Project webpage: https://gen2res.github.io.

Snapshot Lidar: Fourier Embedding of Amplitude and Phase for Single-Image Depth Reconstruction
Sarah Friday, Yunzi Shi, Yaswanth Cherivirala, Vishwanath Saragadam, Adithya Pediredla; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 25203-25212
Amplitude modulated continuous-wave time-of-flight (AMCW-ToF) cameras are finding applications as flash Lidars in autonomous navigation robotics and AR/VR applications. A conventional CW-ToF camera requires illuminating the scene with a temporally varying light source and demodulating a set of quadrature measurements to recover the scene's depth and intensity. Capturing the four measurements in sequence renders the system slow invariably causing inaccuracies in depth estimates due to motion in the scene or the camera. To mitigate this problem we propose a snapshot Lidar that captures amplitude and phase simultaneously as a single time-of-flight hologram. Uniquely our approach requires minimal changes to existing CW-ToF imaging hardware. To demonstrate the efficacy of the proposed system we design and build a lab prototype and evaluate it under varying scene geometries illumination conditions and compare the reconstructed depth measurements against conventional techniques. We rigorously evaluate the robustness of our system on diverse real-world scenes to show that our technique results in a significant reduction in data bandwidth with minimal loss in reconstruction accuracy. As high-resolution CW-ToF cameras are becoming ubiquitous increasing their temporal resolution by four times enables robust real-time capture of geometries of dynamic scenes.

Convolutional Prompting meets Language Models for Continual Learning
Anurag Roy, Riddhiman Moulick, Vinay K. Verma, Saptarshi Ghosh, Abir Das; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 23616-23626
Continual Learning (CL) enables machine learning models to learn from continuously shifting new training data in absence of data from old tasks. Recently pre-trained vision transformers combined with prompt tuning have shown promise for overcoming catastrophic forgetting in CL. These approaches rely on a pool of learnable prompts which can be inefficient in sharing knowledge across tasks leading to inferior performance. In addition the lack of fine-grained layer specific prompts does not allow these to fully express the strength of the prompts for CL. We address these limitations by proposing ConvPrompt a novel convolutional prompt creation mechanism that maintains layer-wise shared embeddings enabling both layer-specific learning and better concept transfer across tasks. The intelligent u

se of convolution enables us to maintain a low parameter overhead without compro mising performance. We further leverage Large Language Models to generate fine-g rained text descriptions of each category which are used to get task similarity and dynamically decide the number of prompts to be learned. Extensive experiment s demonstrate the superiority of ConvPrompt and improves SOTA by 3% with signifi cantly less parameter overhead. We also perform strong ablation over various mod ules to disentangle the importance of different components.

Blur-aware Spatio-temporal Sparse Transformer for Video Deblurring
Huicong Zhang, Haozhe Xie, Hongxun Yao; Proceedings of the IEEE/CVF Conference o n Computer Vision and Pattern Recognition (CVPR), 2024, pp. 2673-2681
Video deblurring relies on leveraging information from other frames in the video sequence to restore the blurred regions in the current frame. Mainstream approa ches employ bidirectional feature propagation spatio-temporal transformers or a combination of both to extract information from the video sequence. However limi tations in memory and computational resources constraints the temporal window le ngth of the spatio-temporal transformer preventing the extraction of longer temp oral contextual information from the video sequence. Additionally bidirectional feature propagation is highly sensitive to inaccurate optical flow in blurry fra mes leading to error accumulation during the propagation process. To address the se issues we propose BSSTNet Blur-aware Spatio-temporal Sparse Transformer Netwo rk. It introduces the blur map which converts the originally dense attention int o a sparse form enabling a more extensive utilization of information throughout the entire video sequence. Specifically BSSTNet (1) uses a longer temporal windo w in the transformer leveraging information from more distant frames to restore the blurry pixels in the current frame. (2) introduces bidirectional feature pro pagation guided by blur maps which reduces error accumulation caused by the blur frame. The experimental results demonstrate the proposed BSSTNet outperforms th e state-of-the-art methods on the GoPro and DVD datasets.

Towards Learning a Generalist Model for Embodied Navigation
Duo Zheng, Shijia Huang, Lin Zhao, Yiwu Zhong, Liwei Wang; Proceedings of the IE EE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 1 3624-13634
Building a generalist agent that can interact with the world is an ultimate goal for humans thus spurring the research for embodied navigation where an agent is required to navigate according to instructions or respond to queries. Despite t he major progress attained previous works primarily focus on task-specific agent s and lack generalizability to unseen scenarios. Recently LLMs have presented re markable capabilities across various fields and provided a promising opportunity for embodied navigation. Drawing on this we propose the first generalist model for embodied navigation NaviLLM. It adapts LLMs to embodied navigation by introd ucing schema-based instruction. The schema-based instruction flexibly casts vari ous tasks into generation problems thereby unifying a wide range of tasks. This approach allows us to integrate diverse data sources from various datasets into the training equipping NaviLLM with a wide range of capabilities required by emb odied navigation. We conduct extensive experiments to evaluate the performance a nd generalizability of our model. The experimental results demonstrate that our unified model achieves state-of-the-art performance on CVDN SOON and ScanQA. Spe cifically it surpasses the previous stats-of-the-art method by a significant mar gin of 29% in goal progress on CVDN. Moreover our model also demonstrates strong generalizability and presents impressive results on unseen tasks e.g. embodied question answering and 3D captioning.

DiffusionPoser: Real-time Human Motion Reconstruction From Arbitrary Sparse Sens ors Using Autoregressive Diffusion
Tom Van Wouwe, Seunghwan Lee, Antoine Falisse, Scott Delp, C. Karen Liu; Proceed ings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 2513-2523
Motion capture from a limited number of body-worn sensors such as inertial measu

rement units (IMUs) and pressure insoles has important applications in health hu man performance and entertainment. Recent work has focused on accurately reconst ructing whole-body motion from a specific sensor configuration using six IMUs. W hile a common goal across applications is to use the minimal number of sensors t o achieve required accuracy the optimal arrangement of the sensors might differ from application to application. We propose a single diffusion model DiffusionPo ser which reconstructs human motion in real-time from an arbitrary combination o f sensors including IMUs placed at specified locations and pressure insoles. Unl ike existing methods our model grants users the flexibility to determine the num ber and arrangement of sensors tailored to the specific activity of interest wit hout the need for retraining. A novel autoregressive inferencing scheme ensures real-time motion reconstruction that closely aligns with measured sensor signals . The generative nature of DiffusionPoser ensures realistic behavior even for de grees-of-freedom not directly measured. Qualitative results can be found on our project website.

MANUS: Markerless Grasp Capture using Articulated 3D Gaussians
Chandradeep Pokhariya, Ishaan Nikhil Shah, Angela Xing, Zekun Li, Kefan Chen, Av inash Sharma, Srinath Sridhar; Proceedings of the IEEE/CVF Conference on Compute r Vision and Pattern Recognition (CVPR), 2024, pp. 2197-2208
Understanding how we grasp objects with our hands has important applications in areas like robotics and mixed reality. However this challenging problem requires accurate modeling of the contact between hands and objects.To capture grasps ex isting methods use skeletons meshes or parametric models that does not represent hand shape accurately resulting in inaccurate contacts. We present MANUS a meth od for Markerless Hand-Object Grasp Capture using Articulated 3D Gaussians. We b uild a novel articulated 3D Gaussians representation that extends 3D Gaussian sp latting for high-fidelity representation of articulating hands. Since our repres entation uses Gaussian primitives optimized from the multi-view pixel-aligned lo sses it enables us to efficiently and accurately estimate contacts between the h and and the object. For the most accurate results our method requires tens of ca mera views that current datasets do not provide. We therefore build MANUS-Grasps a new dataset that contains hand-object grasps viewed from 50+ cameras across 3 0+ scenes 3 subjects and comprising over 7M frames. In addition to extensive qua litative results we also show that our method outperforms others on a quantitati ve contact evaluation method that uses paint transfer from the object to the han d.

Distilling Semantic Priors from SAM to Efficient Image Restoration Models
Quan Zhang, Xiaoyu Liu, Wei Li, Hanting Chen, Junchao Liu, Jie Hu, Zhiwei Xiong, Chun Yuan, Yunhe Wang; Proceedings of the IEEE/CVF Conference on Computer Visio n and Pattern Recognition (CVPR), 2024, pp. 25409-25419
In image restoration (IR) leveraging semantic priors from segmentation models ha s been a common approach to improve performance. The recent segment anything mod el (SAM) has emerged as a powerful tool for extracting advanced semantic priors to enhance IR tasks. However the computational cost of SAM is prohibitive for IR compared to existing smaller IR models. The incorporation of SAM for extracting semantic priors considerably hampers the model inference efficiency. To address this issue we propose a general framework to distill SAM's semantic knowledge t o boost exiting IR models without interfering with their inference process. Spec ifically our proposed framework consists of the semantic priors fusion (SPF) sch eme and the semantic priors distillation (SPD) scheme. SPF fuses two kinds of in formation between the restored image predicted by the original IR model and the semantic mask predicted by SAM for the refined restored image. SPD leverages a s elf-distillation manner to distill the fused semantic priors to boost the perfor mance of original IR models. Additionallywe design a semantic-guided relation (S GR) module for SPD which ensures semantic feature representation space consisten cy to fully distill the priors. We demonstrate the effectiveness of our framewor k across multiple IR models and tasks including deraining deblurring and denoisi ng.

Learning Intra-view and Cross-view Geometric Knowledge for Stereo Matching
Rui Gong, Weide Liu, Zaiwang Gu, Xulei Yang, Jun Cheng; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 20752-20762
Geometric knowledge has been shown to be beneficial for the stereo matching task. However prior attempts to integrate geometric insights into stereo matching algorithms have largely focused on geometric knowledge from single images while crucial cross-view factors such as occlusion and matching uniqueness have been overlooked. To address this gap we propose a novel Intra-view and Cross-view Geometric knowledge learning Network (ICGNet) specifically crafted to assimilate both intra-view and cross-view geometric knowledge. ICGNet harnesses the power of interest points to serve as a channel for intra-view geometric understanding. Simultaneously it employs the correspondences among these points to capture cross-view geometric relationships. This dual incorporation empowers the proposed ICGNet to leverage both intra-view and cross-view geometric knowledge in its learning process substantially improving its ability to estimate disparities. Our extensive experiments demonstrate the superiority of the ICGNet over contemporary leading models. The code will be available at https://github.com/DFSDDDDD1199/ICGNet.
****
Rethinking the Evaluation Protocol of Domain Generalization
Han Yu, Xingxuan Zhang, Renzhe Xu, Jiashuo Liu, Yue He, Peng Cui; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 21897-21908
Domain generalization aims to solve the challenge of Out-of-Distribution (OOD) generalization by leveraging common knowledge learned from multiple training domains to generalize to unseen test domains. To accurately evaluate the OOD generalization ability it is required that test data information is unavailable. However the current domain generalization protocol may still have potential test data information leakage. This paper examines the risks of test data information leakage from two aspects of the current evaluation protocol: supervised pretraining on ImageNet and oracle model selection. We propose modifications to the current protocol that we should employ self-supervised pretraining or train from scratch instead of employing the current supervised pretraining and we should use multiple test domains. These would result in a more precise evaluation of OOD generalization ability. We also rerun the algorithms with the modified protocol and introduce new leaderboards to encourage future research in domain generalization with a fairer comparison.
****
Aligning Logits Generatively for Principled Black-Box Knowledge Distillation
Jing Ma, Xiang Xiang, Ke Wang, Yuchuan Wu, Yongbin Li; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 23148-23157
Black-Box Knowledge Distillation (B2KD) is a formulated problem for cloud-to-edge model compression with invisible data and models hosted on the server. B2KD faces challenges such as limited Internet exchange and edge-cloud disparity of data distributions. In this paper we formalize a two-step workflow consisting of deprivatization and distillation and theoretically provide a new optimization direction from logits to cell boundary different from direct logits alignment. With its guidance we propose a new method Mapping-Emulation KD (MEKD) that distills a black-box cumbersome model into a lightweight one. Our method does not differentiate between treating soft or hard responses and consists of: 1) deprivatization: emulating the inverse mapping of the teacher function with a generator and 2) distillation: aligning low-dimensional logits of the teacher and student models by reducing the distance of high-dimensional image points. For different teacher-student pairs our method yields inspiring distillation performance on various benchmarks and outperforms the previous state-of-the-art approaches.

BerfScene: Bev-conditioned Equivariant Radiance Fields for Infinite 3D Scene Generation

Qihang Zhang, Yinghao Xu, Yujun Shen, Bo Dai, Bolei Zhou, Ceyuan Yang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 6839-6849
Generating large-scale 3D scenes cannot simply apply existing 3D object synthesis technique since 3D scenes usually hold complex spatial configurations and consist of a number of objects at varying scales. We thus propose a practical and efficient 3D representation that incorporates an equivariant radiance field with the guidance of a bird's-eye view (BEV) map. Concretely objects of synthesized 3D scenes could be easily manipulated through steering the corresponding BEV maps. Moreover by adequately incorporating positional encoding and low-pass filters into the generator the representation becomes equivariant to the given BEV map. Such equivariance allows us to produce large-scale even infinite-scale 3D scenes via synthesizing local scenes and then stitching them with smooth consistency. Extensive experiments on 3D scene datasets demonstrate the effectiveness of our approach. Our project website is at: https://https://zqh0253.github.io/BerfScene.

3D Facial Expressions through Analysis-by-Neural-Synthesis
George Retsinas, Panagiotis P. Filntisis, Radek Danecek, Victoria F. Abrevaya, Anastasios Roussos, Timo Bolkart, Petros Maragos; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 2490-2501
While existing methods for 3D face reconstruction from in-the-wild images excel at recovering the overall face shape they commonly miss subtle extreme asymmetric or rarely observed expressions. We improve upon these methods with SMIRK (Spatial Modeling for Image-based Reconstruction of Kinesics) which faithfully reconstructs expressive 3D faces from images. We identify two key limitations in existing methods: shortcomings in their self-supervised training formulation and a lack of expression diversity in the training images. For training most methods employ differentiable rendering to compare a predicted face mesh with the input image along with a plethora of additional loss functions. This differentiable rendering loss not only has to provide supervision to optimize for 3D face geometry camera albedo and lighting which is an ill-posed optimization problem but the domain gap between rendering and input image further hinders the learning process. Instead SMIRK replaces the differentiable rendering with a neural rendering module that given the rendered predicted mesh geometry and sparsely sampled pixels of the input image generates a face image. As the neural rendering gets color information from sampled image pixels supervising with neural rendering-based reconstruction loss can focus solely on the geometry. Further it enables us to generate images of the input identity with varying expressions while training. These are then utilized as input to the reconstruction model and used as supervision with ground truth geometry. This effectively augments the training data and enhances the generalization for diverse expressions. Our qualitative quantitative and particularly our perceptual evaluations demonstrate that SMIRK achieves the new state-of-the art performance on accurate expression reconstruction. For our method's source code demo video and more please visit our project webpage: https://georgeretsi.github.io/smirk/.

HoloVIC: Large-scale Dataset and Benchmark for Multi-Sensor Holographic Intersection and Vehicle-Infrastructure Cooperative
Cong Ma, Lei Qiao, Chengkai Zhu, Kai Liu, Zelong Kong, Qing Li, Xueqi Zhou, Yuheng Kan, Wei Wu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 22129-22138
Vehicle-to-everything (V2X) is a popular topic in the field of Autonomous Driving in recent years. Vehicle-infrastructure cooperation (VIC) becomes one of the important research area. Due to the complexity of traffic conditions such as blind spots and occlusion it greatly limits the perception capabilities of single-view roadside sensing systems. To further enhance the accuracy of roadside perception and provide better information to the vehicle side in this paper we constructed holographic intersections with various layouts to build a large-scale multi-sensor holographic vehicle-infrastructure cooperation dataset called HoloVIC. Our dataset includes 3 different types of sensors (Camera Lidar Fisheye) and emplo

ys 4 sensor-layouts based on the different intersections. Each intersection is e quipped with 6-18 sensors to capture synchronous data. While autonomous vehicles pass through these intersections for collecting VIC data. HoloVIC contains in t otal on 100k+ synchronous frames from different sensors. Additionally we annotat ed 3D bounding boxes based on Camera Fisheye and Lidar. We also associate the ID s of the same objects across different devices and consecutive frames in sequenc e. Based on HoloVIC we formulated four tasks to facilitate the development of re lated research. We also provide benchmarks for these tasks.

Unleashing the Potential of SAM for Medical Adaptation via Hierarchical Decoding
Zhiheng Cheng, Qingyue Wei, Hongru Zhu, Yan Wang, Liangqiong Qu, Wei Shao, Yuyin Zhou; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Rec ognition (CVPR), 2024, pp. 3511-3522
The Segment Anything Model (SAM) has garnered significant attention for its vers atile segmentation abilities and intuitive prompt-based interface. However its a pplication in medical imaging presents challenges requiring either substantial t raining costs and extensive medical datasets for full model fine-tuning or high-quality prompts for optimal performance. This paper introduces H-SAM: a prompt-f ree adaptation of SAM tailored for efficient fine-tuning of medical images via a two-stage hierarchical decoding procedure. In the initial stage H-SAM employs S AM's original decoder to generate a prior probabilistic mask guiding a more intr icate decoding process in the second stage. Specifically we propose two key desi gns: 1) A class-balanced mask-guided self-attention mechanism addressing the unb alanced label distribution enhancing image embedding; 2) A learnable mask cross-attention mechanism spatially modulating the interplay among different image reg ions based on the prior mask. Moreover the inclusion of a hierarchical pixel dec oder in H-SAM enhances its proficiency in capturing fine-grained and localized d etails. This approach enables SAM to effectively integrate learned medical prior s facilitating enhanced adaptation for medical image segmentation with limited s amples. Our H-SAM demonstrates a 4.78% improvement in average Dice compared to e xisting prompt-free SAM variants for multi-organ segmentation using only 10% of 2D slices. Notably without using any unlabeled data H-SAM even outperforms state -of-the-art semi-supervised models relying on extensive unlabeled training data across various medical datasets. Our code is available at https://github.com/Ccc ccczh404/H-SAM.

Puff-Net: Efficient Style Transfer with Pure Content and Style Feature Fusion Ne twork
Sizhe Zheng, Pan Gao, Peng Zhou, Jie Qin; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 8059-8068
Style transfer aims to render an image with the artistic features of a style ima ge while maintaining the original structure. Various methods have been put forwa rd for this task but some challenges still exist. For instance it is difficult f or CNN-based methods to handle global information and long-range dependencies be tween input images for which transformer-based methods have been proposed. Altho ugh transformer can better model the relationship between content and style imag es they require high-cost hardware and time-consuming inference. To address thes e issues we design a novel transformer model that includes only encoders thus si gnificantly reducing the computational cost. In addition we also find that exist ing style transfer methods may lead to images under-stylied or missing content. In order to achieve better stylization we design a content feature extractor and a style feature extractor. Then we can feed pure content and style images into the transformer. Finally we propose a network model termed Puff-Net i.e. efficie nt style transfer with pure content and style feature fusion network. Through qu alitative and quantitative experiments we demonstrate the advantages of our mode l compared to state-of-the-art ones in the literature. The code is availabel at https://github.com/ZszYmy9/Puff-Net.

Towards Progressive Multi-Frequency Representation for Image Warping
Jun Xiao, Zihang Lyu, Cong Zhang, Yakun Ju, Changjian Shui, Kin-Man Lam; Proceed

ings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 2995-3004

Image warping a classic task in computer vision aims to use geometric transformations to change the appearance of images. Recent methods learn the resampling kernels for warping through neural networks to estimate missing values in irregular grids which however fail to capture local variations in deformed content and produce images with distortion and less high-frequency details. To address this issue this paper proposes an effective method namely MFR to learn Multi-Frequency Representations from input images for image warping. Specifically we propose a progressive filtering network to learn image representations from different frequency subbands and generate deformable images in a coarse-to-fine manner. Furthermore we employ learnable Gabor wavelet filters to improve the model's capability to learn local spatial-frequency representations. Comprehensive experiments including homography transformation equirectangular to perspective projection and asymmetric image super-resolution demonstrate that the proposed MFR significantly outperforms state-of-the-art image warping methods. Our method also showcases superior generalization to out-of-distribution domains where the generated images are equipped with rich details and less distortion thereby high visual quality. The source code is available at https://github.com/junxiao01/MFR.

Learning to Control Camera Exposure via Reinforcement Learning

Kyunghyun Lee, Ukcheol Shin, Byeong-Uk Lee; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 2975-2983

Adjusting camera exposure in arbitrary lighting conditions is the first step to ensure the functionality of computer vision applications. Poorly adjusted camera exposure often leads to critical failure and performance degradation. Traditional camera exposure control methods require multiple convergence steps and time-consuming processes making them unsuitable for dynamic lighting conditions. In this paper we propose a new camera exposure control framework that rapidly controls camera exposure while performing real-time processing by exploiting deep reinforcement learning. The proposed framework consists of four contributions: 1) a simplified training ground to simulate real-world's diverse and dynamic lighting changes 2) flickering and image attribute-aware reward design along with lightweight state design for real-time processing 3) a static-to-dynamic lighting curriculum to gradually improve the agent's exposure-adjusting capability and 4) domain randomization techniques to alleviate the limitation of the training ground and achieve seamless generalization in the wild. As a result our proposed method rapidly reaches a desired exposure level within five steps with real-time processing (1 ms). Also the acquired images are well-exposed and show superiority in various computer vision tasks such as feature extraction and object detection.

Splatter Image: Ultra-Fast Single-View 3D Reconstruction

Stanislaw Szymanowicz, Chrisitian Rupprecht, Andrea Vedaldi; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 10208-10217

We introduce the Splatter Image an ultra-efficient approach for monocular 3D object reconstruction. Splatter Image is based on Gaussian Splatting which allows fast and high-quality reconstruction of 3D scenes from multiple images. We apply Gaussian Splatting to monocular reconstruction by learning a neural network that at test time performs reconstruction in a feed-forward manner at 38 FPS. Our main innovation is the surprisingly straightforward design of this network which using 2D operators maps the input image to one 3D Gaussian per pixel. The resulting set of Gaussians thus has the form an image the Splatter Image. We further extend the method take several images as input via cross-view attention. Owning to the speed of the renderer (588 FPS) we use a single GPU for training while generating entire images at each iteration to optimize perceptual metrics like LPIPS. On several synthetic real multi-category and large-scale benchmark datasets we achieve better results in terms of PSNR LPIPS and other metrics while training and evaluating much faster than prior works. Code models and more results are available at https://szymanowiczs.github.io/ splatter-image.

Modeling Collaborator: Enabling Subjective Vision Classification With Minimal Hu man Effort via LLM Tool-Use
Imad Eddine Toubal, Aditya Avinash, Neil Gordon Alldrin, Jan Dlabal, Wenlei Zhou , Enming Luo, Otilia Stretcu, Hao Xiong, Chun-Ta Lu, Howard Zhou, Ranjay Krishna , Ariel Fuxman, Tom Duerig; Proceedings of the IEEE/CVF Conference on Computer V ision and Pattern Recognition (CVPR), 2024, pp. 17553-17563
From content moderation to wildlife conservation the number of applications that require models to recognize nuanced or subjective visual concepts is growing. T raditionally developing classifiers for such concepts requires substantial manua l effort measured in hours days or even months to identify and annotate data nee ded for training. Even with recently proposed Agile Modeling techniques which en able rapid bootstrapping of image classifiers users are still required to spend 30 minutes or more of monotonous repetitive data labeling just to train a single classifier. Drawing on Fiske's Cognitive Miser theory we propose a new framewor k that alleviates manual effort by replacing human labeling with natural languag e interactions reducing the total effort required to define a concept by an orde r of magnitude: from labeling 2000 images to only 100 plus some natural language interactions. Our framework leverages recent advances in foundation models both large language models and vision-language models to carve out the concept space through conversation and by automatically labeling training data points. Most i mportantly our framework eliminates the need for crowd-sourced annotations. More over our framework ultimately produces lightweight classification models that ar e deployable in cost-sensitive scenarios. Across 15 subjective concepts and acro ss 2 public image classification datasets our trained models outperform traditio nal Agile Modeling as well as state-of-the-art zero-shot classification models l ike ALIGN CLIP CuPL and large visual question answering models like PaLI-X.
****
RNb-NeuS: Reflectance and Normal-based Multi-View 3D Reconstruction
Baptiste Brument, Robin Bruneau, Yvain Quéau, Jean Mélou, François Bernard Lauze , Jean-Denis Durou, Lilian Calvet; Proceedings of the IEEE/CVF Conference on Com puter Vision and Pattern Recognition (CVPR), 2024, pp. 5230-5239
This paper introduces a versatile paradigm for integrating multi-view reflectanc e (optional) and normal maps acquired through photometric stereo. Our approach e mploys a pixel-wise joint re-parameterization of reflectance and normal consider ing them as a vector of radiances rendered under simulated varying illumination. This re-parameterization enables the seamless integration of reflectance and no rmal maps as input data in neural volume rendering-based 3D reconstruction while preserving a single optimization objective. In contrast recent multi-view photo metric stereo (MVPS) methods depend on multiple potentially conflicting objectiv es. Despite its apparent simplicity our proposed approach outperforms state-of-t he-art approaches in MVPS benchmarks across F-score Chamfer distance and mean an gular error metrics. Notably it significantly improves the detailed 3D reconstru ction of areas with high curvature or low visibility.

LOTUS: Evasive and Resilient Backdoor Attacks through Sub-Partitioning
Siyuan Cheng, Guanhong Tao, Yingqi Liu, Guangyu Shen, Shengwei An, Shiwei Feng, Xiangzhe Xu, Kaiyuan Zhang, Shiqing Ma, Xiangyu Zhang; Proceedings of the IEEE/C VF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 24798 -24809
Backdoor attack poses a significant security threat to Deep Learning application s. Existing attacks are often not evasive to established backdoor detection tech niques. This susceptibility primarily stems from the fact that these attacks typ ically leverage a universal trigger pattern or transformation function such that the trigger can cause misclassification for any input. In response to this rece nt papers have introduced attacks using sample-specific invisible triggers craft ed through special transformation functions. While these approaches manage to ev ade detection to some extent they reveal vulnerability to existing backdoor miti gation techniques. To address and enhance both evasiveness and resilience we int roduce a novel backdoor attack LOTUS. Specifically it leverages a secret functio

n to separate samples in the victim class into a set of partitions and applies u
nique triggers to different partitions. Furthermore LOTUS incorporates an effect
ive trigger focusing mechanism ensuring only the trigger corresponding to the pa
rtition can induce the backdoor behavior. Extensive experimental results show th
at LOTUS can achieve high attack success rate across 4 datasets and 7 model stru
ctures and effectively evading 13 backdoor detection and mitigation techniques.
The code is available at https://github.com/Megum1/LOTUS.

GeoReF: Geometric Alignment Across Shape Variation for Category-level Object Pos
e Refinement
Linfang Zheng, Tze Ho Elden Tse, Chen Wang, Yinghan Sun, Hua Chen, Ales Leonardi
s, Wei Zhang, Hyung Jin Chang; Proceedings of the IEEE/CVF Conference on Compute
r Vision and Pattern Recognition (CVPR), 2024, pp. 10693-10703
Object pose refinement is essential for robust object pose estimation. Previous
work has made significant progress towards instance-level object pose refinement
. Yet category-level pose refinement is a more challenging problem due to large
shape variations within a category and the discrepancies between the target obje
ct and the shape prior. To address these challenges we introduce a novel archite
cture for category-level object pose refinement. Our approach integrates an HS-l
ayer and learnable affine transformations which aims to enhance the extraction a
nd alignment of geometric information. Additionally we introduce a cross-cloud t
ransformation mechanism that efficiently merges diverse data sources. Finally we
 push the limits of our model by incorporating the shape prior information for t
ranslation and size error prediction. We conducted extensive experiments to demo
nstrate the effectiveness of the proposed framework. Through extensive quantitat
ive experiments we demonstrate significant improvement over the baseline method
by a large margin across all metrics.

LAN: Learning to Adapt Noise for Image Denoising
Changjin Kim, Tae Hyun Kim, Sungyong Baik; Proceedings of the IEEE/CVF Conferenc
e on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 25193-25202
Removing noise from images a.k.a image denoising can be a very challenging task
since the type and amount of noise can greatly vary for each image due to many f
actors including a camera model and capturing environments. While there have bee
n striking improvements in image denoising with the emergence of advanced deep l
earning architectures and real-world datasets recent denoising networks struggle
 to maintain performance on images with noise that has not been seen during trai
ning. One typical approach to address the challenge would be to adapt a denoisin
g network to new noise distribution. Instead in this work we shift our attention
 to the input noise itself for adaptation rather than adapting a network. Thus w
e keep a pretrained network frozen and adapt an input noise to capture the fine-
grained deviations. As such we propose a new denoising algorithm dubbed Learning
-to-Adapt-Noise (LAN) where a learnable noise offset is directly added to a give
n noisy image to bring a given input noise closer towards the noise distribution
 a denoising network is trained to handle. Consequently the proposed framework e
xhibits performance improvement on images with unseen noise displaying the poten
tial of the proposed research direction.

Scaling Up Dynamic Human-Scene Interaction Modeling
Nan Jiang, Zhiyuan Zhang, Hongjie Li, Xiaoxuan Ma, Zan Wang, Yixin Chen, Tengyu
Liu, Yixin Zhu, Siyuan Huang; Proceedings of the IEEE/CVF Conference on Computer
 Vision and Pattern Recognition (CVPR), 2024, pp. 1737-1747
Confronting the challenges of data scarcity and advanced motion synthesis in hum
an-scene interaction modeling we introduce the TRUMANS dataset alongside a novel
 HSI motion synthesis method. TRUMANS stands as the most comprehensive motion-ca
ptured HSI dataset currently available encompassing over 15 hours of human inter
actions across 100 indoor scenes. It intricately captures whole-body human motio
ns and part-level object dynamics focusing on the realism of contact. This datas
et is further scaled up by transforming physical environments into exact virtual
 models and applying extensive augmentations to appearance and motion for both h

umans and objects while maintaining interaction fidelity. Utilizing TRUMANS we d
evise a diffusion-based autoregressive model that efficiently generates HSI sequ
ences of any length taking into account both scene context and intended actions.
 In experiments our approach shows remarkable zero-shot generalizability on a ra
nge of 3D scene datasets (e.g. PROX Replica ScanNet ScanNet++) producing motions
 that closely mimic original motion-captured sequences as confirmed by quantitat
ive experiments and human studies.

Semantic-aware SAM for Point-Prompted Instance Segmentation
Zhaoyang Wei, Pengfei Chen, Xuehui Yu, Guorong Li, Jianbin Jiao, Zhenjun Han; Pr
oceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition
(CVPR), 2024, pp. 3585-3594
Single-point annotation in visual tasks with the goal of minimizing labeling cos
ts is becoming increasingly prominent in research. Recently visual foundation mo
dels such as Segment Anything (SAM) have gained widespread usage due to their ro
bust zero-shot capabilities and exceptional annotation performance. However SAM'
s class-agnostic output and high confidence in local segmentation introduce sema
ntic ambiguity posing a challenge for precise category-specific segmentation. In
 this paper we introduce a cost-effective category-specific segmenter using SAM.
 To tackle this challenge we have devised a Semantic-Aware Instance Segmentation
 Network (SAPNet) that integrates Multiple Instance Learning (MIL) with matching
 capability and SAM with point prompts. SAPNet strategically selects the most re
presentative mask proposals generated by SAM to supervise segmentation with a sp
ecific focus on object category information. Moreover we introduce the Point Dis
tance Guidance and Box Mining Strategy to mitigate inherent challenges: group an
d local issues in weakly supervised segmentation. These strategies serve to furt
her enhance the overall segmentation performance. The experimental results on Pa
scal VOC and COCO demonstrate the promising performance of our proposed SAPNet e
mphasizing its semantic matching capabilities and its potential to advance point
-prompted instance segmentation. The code is available at https://github.com/zha
oyangwei123/SAPNet.

Learning Group Activity Features Through Person Attribute Prediction
Chihiro Nakatani, Hiroaki Kawashima, Norimichi Ukita; Proceedings of the IEEE/CV
F Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 18233-
18242
This paper proposes Group Activity Feature (GAF) learning in which features of m
ulti-person activity are learned as a compact latent vector. Unlike prior work i
n which the manual annotation of group activities is required for supervised lea
rning our method learns the GAF through person attribute prediction without grou
p activity annotations. By learning the whole network in an end-to-end manner so
 that the GAF is required for predicting the person attributes of people in a gr
oup the GAF is trained as the features of multi-person activity. As a person att
ribute we propose to use a person's action class and appearance features because
 the former is easy to annotate due to its simpleness and the latter requires no
 manual annotation. In addition we introduce a location-guided attribute predict
ion to disentangle the complex GAF for extracting the features of each target pe
rson properly. Various experimental results validate that our method outperforms
 SOTA methods quantitatively and qualitatively on two public datasets. Visualiza
tion of our GAF also demonstrates that our method learns the GAF representing fi
ned-grained group activity classes. Code: https://github.com/chihina/GAFL-CVPR20

HUNTER: Unsupervised Human-centric 3D Detection via Transferring Knowledge from
Synthetic Instances to Real Scenes
Yichen Yao, Zimo Jiang, Yujing Sun, Zhencai Zhu, Xinge Zhu, Runnan Chen, Yuexin
Ma; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recogn
ition (CVPR), 2024, pp. 28120-28129
Human-centric 3D scene understanding has recently drawn increasing attention dri
ven by its critical impact on robotics. However human-centric real-life scenario

s are extremely diverse and complicated and humans have intricate motions and interactions. With limited labeled data supervised methods are difficult to generalize to general scenarios hindering real-life applications. Mimicking human intelligence we propose an unsupervised 3D detection method for human-centric scenarios by transferring the knowledge from synthetic human instances to real scenes. To bridge the gap between the distinct data representations and feature distributions of synthetic models and real point clouds we introduce novel modules for effective instance-to-scene representation transfer and synthetic-to-real feature alignment. Remarkably our method exhibits superior performance compared to current state-of-the-art techniques achieving 87.8% improvement in mAP and closely approaching the performance of fully supervised methods (62.15 mAP vs. 69.02 mAP) on HuCenLife Dataset.

Improving Transferable Targeted Adversarial Attacks with Model Self-Enhancement
Han Wu, Guanyan Ou, Weibin Wu, Zibin Zheng; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 24615-24624
Various transfer attack methods have been proposed to evaluate the robustness of deep neural networks (DNNs). Although manifesting remarkable performance in generating untargeted adversarial perturbations existing proposals still fail to achieve high targeted transferability. In this work we discover that the adversarial perturbations' overfitting towards source models of mediocre generalization capability can hurt their targeted transferability. To address this issue we focus on enhancing the source model's generalization capability to improve its ability to conduct transferable targeted adversarial attacks. In pursuit of this goal we propose a novel model self-enhancement method that incorporates two major components: Sharpness-Aware Self-Distillation (SASD) and Weight Scaling (WS). Specifically SASD distills a fine-tuned auxiliary model which mirrors the source model's structure into the source model while flattening the source model's loss landscape. WS obtains an approximate ensemble of numerous pruned models to perform model augmentation which can be conveniently synergized with SASD to elevate the source model's generalization capability and thus improve the resultant targeted perturbations' transferability. Extensive experiments corroborate the effectiveness of the proposed method. Notably under the black-box setting our approach can outperform the state-of-the-art baselines by a significant margin of 12.2% on average in terms of the obtained targeted transferability. Code is available at https://github.com/g4alllf/SASD.

Unsupervised Learning of Category-Level 3D Pose from Object-Centric Videos
Leonhard Sommer, Artur Jesslen, Eddy Ilg, Adam Kortylewski; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 22787-22796
Category-level 3D pose estimation is a fundamentally important problem in computer vision and robotics e.g. for embodied agents or to train 3D generative models. However so far methods that estimate the category-level object pose require either large amounts of human annotations CAD models or input from RGB-D sensors. In contrast we tackle the problem of learning to estimate the category-level 3D pose only from casually taken object-centric videos without human supervision. We propose a two-step pipeline: First we introduce a multi-view alignment procedure that determines canonical camera poses across videos with a novel and robust cyclic distance formulation for geometric and appearance matching using reconstructed coarse meshes and DINOv2 features. In a second step the canonical poses and reconstructed meshes enable us to train a model for 3D pose estimation from a single image. In particular our model learns to estimate dense correspondences between images and a prototypical 3D template by predicting for each pixel in a 2D image a feature vector of the corresponding vertex in the template mesh. We demonstrate that our method outperforms all baselines at the unsupervised alignment of object-centric videos by a large margin and provides faithful and robust predictions in-the-wild on the Pascal3D+ and ObjectNet3D datasets.

Plug-and-Play Diffusion Distillation

Yi-Ting Hsiao, Siavash Khodadadeh, Kevin Duarte, Wei-An Lin, Hui Qu, Mingi Kwon, Ratheesh Kalarot; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 13743-13752

Diffusion models have shown tremendous results in image generation. However due to the iterative nature of the diffusion process and its reliance on classifier-free guidance inference times are slow. In this paper we propose a new distillation approach for guided diffusion models in which an external lightweight guide model is trained while the original text-to-image model remains frozen. We show that our method reduces the inference computation of classifier-free guided latent-space diffusion models by almost half and only requires 1% trainable parameters of the base model. Furthermore once trained our guide model can be applied to various fine-tuned domain-specific versions of the base diffusion model without the need for additional training: this "plug-and-play" functionality drastically improves inference computation while maintaining the visual fidelity of generated images. Empirically we show that our approach is able to produce visually appealing results and achieve a comparable FID score to the teacher with as few as 8 to 16 steps.

MindBridge: A Cross-Subject Brain Decoding Framework

Shizun Wang, Songhua Liu, Zhenxiong Tan, Xinchao Wang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 11333-11342

Brain decoding a pivotal field in neuroscience aims to reconstruct stimuli from acquired brain signals primarily utilizing functional magnetic resonance imaging (fMRI). Currently brain decoding is confined to a per-subject-per-model paradigm limiting its applicability to the same individual for whom the decoding model is trained. This constraint stems from three key challenges: 1) the inherent variability in input dimensions across subjects due to differences in brain size; 2) the unique intrinsic neural patterns influencing how different individuals perceive and process sensory information; 3) limited data availability for new subjects in real-world scenarios hampers the performance of decoding models. In this paper we present a novel approach MindBridge that achieves cross-subject brain decoding by employing only one model. Our proposed framework establishes a generic paradigm capable of addressing these challenges by introducing biological-inspired aggregation function and novel cyclic fMRI reconstruction mechanism for subject-invariant representation learning. Notably by cycle reconstruction of fMRI MindBridge can enable novel fMRI synthesis which also can serve as pseudo data augmentation. Within the framework we also devise a novel reset-tuning method for adapting a pretrained model to a new subject. Experimental results demonstrate MindBridge's ability to reconstruct images for multiple subjects which is competitive with dedicated subject-specific models. Furthermore with limited data for a new subject we achieve a high level of decoding accuracy surpassing that of subject-specific models. This advancement in cross-subject brain decoding suggests promising directions for wider applications in neuroscience and indicates potential for more efficient utilization of limited fMRI data in real-world scenarios. Make Pixels Dance: High-Dynamic Video Generation

Yan Zeng, Guoqiang Wei, Jiani Zheng, Jiaxin Zou, Yang Wei, Yuchen Zhang, Hang Li; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 8850-8860

Creating high-dynamic videos such as motion-rich actions and sophisticated visual effects poses a significant challenge in the field of artificial intelligence. Unfortunately current state-of-the-art video generation methods primarily focusing on text-to-video generation tend to produce video clips with minimal motions despite maintaining high fidelity. We argue that relying solely on text instructions is insufficient and suboptimal for video generation. In this paper we introduce PixelDance a novel approach based on diffusion models that incorporates image instructions for both the first and last frames in conjunction with text instructions for video generation. Comprehensive experimental results demonstrate t

hat PixelDance trained with public data exhibits significantly better proficienc y in synthesizing videos with complex scenes and intricate motions setting a new standard for video generation.

MM-Narrator: Narrating Long-form Videos with Multimodal In-Context Learning
Chaoyi Zhang, Kevin Lin, Zhengyuan Yang, Jianfeng Wang, Linjie Li, Chung-Ching Lin, Zicheng Liu, Lijuan Wang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 13647-13657
We present MM-Narrator a novel system leveraging GPT-4 with multimodal in-context learning for the generation of audio descriptions (AD). Unlike previous methods that primarily focused on downstream fine-tuning with short video clips MM-Narrator excels in generating precise audio descriptions for videos of extensive lengths even beyond hours in an autoregressive manner. This capability is made possible by the proposed memory-augmented generation process which effectively utilizes both the short-term textual context and long-term visual memory through an efficient register-and-recall mechanism. These contextual memories compile pertinent past information including storylines and character identities ensuring an accurate tracking and depicting of story-coherent and character-centric audio descriptions. Maintaining the training-free design of MM-Narrator we further propose a complexity-based demonstration selection strategy to largely enhance its multi-step reasoning capability via few-shot multimodal in-context learning (MM-ICL). Experimental results on MAD-eval dataset demonstrate that MM-Narrator consistently outperforms both the existing fine-tuning-based approaches and LLM-based approaches in most scenarios as measured by standard evaluation metrics. Additionally we introduce the first segment-based evaluator for recurrent text generation. Empowered by GPT-4 this evaluator comprehensively reasons and marks AD generation performance in various extendable dimensions.

Morphable Diffusion: 3D-Consistent Diffusion for Single-image Avatar Creation
Xiyi Chen, Marko Mihajlovic, Shaofei Wang, Sergey Prokudin, Siyu Tang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 10359-10370
Recent advances in generative diffusion models have enabled the previously unfeasible capability of generating 3D assets from a single input image or a text prompt. In this work we aim to enhance the quality and functionality of these models for the task of creating controllable photorealistic human avatars. We achieve this by integrating a 3D morphable model into the state-of-the-art multi-view-consistent diffusion approach. We demonstrate that accurate conditioning of a generative pipeline on the articulated 3D model enhances the baseline model performance on the task of novel view synthesis from a single image. More importantly this integration facilitates a seamless and accurate incorporation of facial expression and body pose control into the generation process. To the best of our knowledge our proposed framework is the first diffusion model to enable the creation of fully 3D-consistent animatable and photorealistic human avatars from a single image of an unseen subject; extensive quantitative and qualitative evaluations demonstrate the advantages of our approach over existing state-of-the-art avatar creation models on both novel view and novel expression synthesis tasks. The code for our project is publicly available.
****
Fully Convolutional Slice-to-Volume Reconstruction for Single-Stack MRI
Sean I. Young, Yael Balbastre, Bruce Fischl, Polina Golland, Juan Eugenio Iglesias; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 11535-11545
In magnetic resonance imaging (MRI) slice-to-volume reconstruction (SVR) refers to computational reconstruction of an unknown 3D magnetic resonance volume from stacks of 2D slices corrupted by motion. While promising current SVR methods require multiple slice stacks for accurate 3D reconstruction leading to long scans and limiting their use in time-sensitive applications such as fetal fMRI. Here we propose a SVR method that overcomes the shortcomings of previous work and produces state-of-the-art reconstructions in the presence of extreme inter-slice mot

ion. Inspired by the recent success of single-view depth estimation methods we f
ormulate SVR as a single-stack motion estimation task and train a fully convolut
ional network to predict a motion stack for a given slice stack producing a 3D r
econstruction as a byproduct of the predicted motion. Extensive experiments on t
he SVR of adult and fetal brains demonstrate that our fully convolutional method
 is twice as accurate as previous SVR methods. Our code is available at github.c
om/seannz/svr.

Enhance Image Classification via Inter-Class Image Mixup with Diffusion Model
Zhicai Wang, Longhui Wei, Tan Wang, Heyu Chen, Yanbin Hao, Xiang Wang, Xiangnan
He, Qi Tian; Proceedings of the IEEE/CVF Conference on Computer Vision and Patte
rn Recognition (CVPR), 2024, pp. 17223-17233
Text-to-image (T2I) generative models have recently emerged as a powerful tool e
nabling the creation of photo-realistic images and giving rise to a multitude of
 applications. However the effective integration of T2I models into fundamental
image classification tasks remains an open question. A prevalent strategy to bol
ster image classification performance is through augmenting the training set wit
h synthetic images generated by T2I models. In this study we scrutinize the shor
tcomings of both current generative and conventional data augmentation technique
s. Our analysis reveals that these methods struggle to produce images that are b
oth faithful (in terms of foreground objects) and diverse (in terms of backgroun
d contexts) for domain-specific concepts. To tackle this challenge we introduce
an innovative inter-class data augmentation method known as Diff-Mix (\href http
s://github.com/Zhicaiwww/Diff-Mix) https://github.com/Zhicaiwww/Diff-Mix   which
 enriches the dataset by performing image translations between classes. Our empi
rical results demonstrate that Diff-Mix achieves a better balance between faithf
ulness and diversity leading to a marked improvement in performance across diver
se image classification scenarios including few-shot conventional and long-tail
classifications for domain-specific datasets.

A&B BNN: Add&Bit-Operation-Only Hardware-Friendly Binary Neural Network
Ruichen Ma, Guanchao Qiao, Yian Liu, Liwei Meng, Ning Ning, Yang Liu, Shaogang H
u; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recogni
tion (CVPR), 2024, pp. 5704-5713
Binary neural networks utilize 1-bit quantized weights and activations to reduce
 both the model's storage demands and computational burden. However advanced bin
ary architectures still incorporate millions of inefficient and nonhardware-frie
ndly full-precision multiplication operations. A&B BNN is proposed to directly r
emove part of the multiplication operations in a traditional BNN and replace the
 rest with an equal number of bit operations introducing the mask layer and the
quantized RPReLU structure based on the normalizer-free network architecture. Th
e mask layer can be removed during inference by leveraging the intrinsic charact
eristics of BNN with straightforward mathematical transformations to avoid the a
ssociated multiplication operations. The quantized RPReLU structure enables more
 efficient bit operations by constraining its slope to be integer powers of 2. E
xperimental results achieved 92.30% 69.35% and 66.89% on the CIFAR-10 CIFAR-100
and ImageNet datasets respectively which are competitive with the state-of-the-a
rt. Ablation studies have verified the efficacy of the quantized RPReLU structur
e leading to a 1.14% enhancement on the ImageNet compared to using a fixed slope
 RLeakyReLU. The proposed add&bit-operation-only BNN offers an innovative approa
ch for hardware-friendly network architecture.

Alpha-CLIP: A CLIP Model Focusing on Wherever You Want
Zeyi Sun, Ye Fang, Tong Wu, Pan Zhang, Yuhang Zang, Shu Kong, Yuanjun Xiong, Dah
ua Lin, Jiaqi Wang; Proceedings of the IEEE/CVF Conference on Computer Vision an
d Pattern Recognition (CVPR), 2024, pp. 13019-13029
Contrastive Language-Image Pre-training (CLIP) plays an essential role in extrac
ting valuable content information from images across diverse tasks. It aligns te
xtual and visual modalities to comprehend the entire image including all the det
ails even those irrelevant to specific tasks. However for a finer understanding

and controlled editing of images it becomes crucial to focus on specific regions of interest which can be indicated as points masks or boxes by humans or perception models. To fulfill the requirements we introduce Alpha-CLIP an enhanced version of CLIP with an auxiliary alpha channel to suggest attentive regions and fine-tuned with constructed millions of RGBA region-text pairs. Alpha-CLIP not only preserves the visual recognition ability of CLIP but also enables precise control over the emphasis of image contents. It demonstrates effectiveness in various tasks including but not limited to open-world recognition multimodal large language models and conditional 2D / 3D generation. It has a strong potential to serve as a versatile tool for image-related tasks.
****
FutureHuman3D: Forecasting Complex Long-Term 3D Human Behavior from Video Observations
Christian Diller, Thomas Funkhouser, Angela Dai; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 19902-19914
We present a generative approach to forecast long-term future human behavior in 3D requiring only weak supervision from readily available 2D human action data. This is a fundamental task enabling many downstream applications. The required ground-truth data is hard to capture in 3D (mocap suits expensive setups) but easy to acquire in 2D (simple RGB cameras). Thus we design our method to only require 2D RGB data at inference time while being able to generate 3D human motion sequences. We use a differentiable 2D projection scheme in an autoregressive manner for weak supervision and an adversarial loss for 3D regularization. Our method predicts long and complex human behavior sequences (e.g. cooking assembly) consisting of multiple sub-actions. We tackle this in a semantically hierarchical manner jointly predicting high-level coarse action labels together with their low-level fine-grained realizations as characteristic 3D human poses. We observe that these two action representations are coupled in nature and joint prediction benefits both action and pose forecasting. Our experiments demonstrate the complementary nature of joint action and 3D pose prediction: our joint approach outperforms each task treated individually enables robust longer-term sequence prediction and improves over alternative approaches to forecast actions and characteristic 3D poses.
****
NightCC: Nighttime Color Constancy via Adaptive Channel Masking
Shuwei Li, Robby T. Tan; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 25522-25531
Nighttime conditions pose a significant challenge to color constancy due to the diversity of lighting conditions and the presence of substantial low-light noise. Existing color constancy methods struggle with nighttime scenes frequently leading to imprecise light color estimations. To tackle nighttime color constancy we propose a novel unsupervised domain adaptation approach that utilizes labeled daytime data to facilitate learning on unlabeled nighttime images. To specifically address the unique lighting conditions of nighttime and ensure the robustness of pseudo labels we propose adaptive channel masking and light uncertainty. By selectively masking channels that are less sensitive to lighting conditions adaptive channel masking directs the model to progressively focus on features less affected by variations in light colors and noise. Additionally our model leverages light uncertainty to provide a pixel-wise uncertainty estimation regarding light color prediction which helps avoid learning from incorrect labels. Our model demonstrates a significant improvement in accuracy achieving 21.5% lower Mean Angular Error (MAE) compared to the state-of-the-art method on our nighttime dataset.
****
Task-aligned Part-aware Panoptic Segmentation through Joint Object-Part Representations
Daan de Geus, Gijs Dubbelman; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 3174-3183
Part-aware panoptic segmentation (PPS) requires (a) that each foreground object and background region in an image is segmented and classified and (b) that all p

arts within foreground objects are segmented classified and linked to their pare nt object. Existing methods approach PPS by separately conducting object-level a nd part-level segmentation. However their part-level predictions are not linked to individual parent objects. Therefore their learning objective is not aligned with the PPS task objective which harms the PPS performance. To solve this and m ake more accurate PPS predictions we propose Task-Aligned Part-aware Panoptic Se gmentation (TAPPS). This method uses a set of shared queries to jointly predict (a) object-level segments and (b) the part-level segments within those same obje cts. As a result TAPPS learns to predict part-level segments that are linked to individual parent objects aligning the learning objective with the task objectiv e and allowing TAPPS to leverage joint object-part representations. With experim ents we show that TAPPS considerably outperforms methods that predict objects an d parts separately and achieves new state-of-the-art PPS results.

From Activation to Initialization: Scaling Insights for Optimizing Neural Fields
Hemanth Saratchandran, Sameera Ramasinghe, Simon Lucey; Proceedings of the IEEE/ CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 413-422
In the realm of computer vision Neural Fields have gained prominence as a contem porary tool harnessing neural networks for signal representation. Despite the re markable progress in adapting these networks to solve a variety of problems the field still lacks a comprehensive theoretical framework. This article aims to ad dress this gap by delving into the intricate interplay between initialization an d activation providing a foundational basis for the robust optimization of Neura l Fields. Our theoretical insights reveal a deep-seated connection among network initialization architectural choices and the optimization process emphasizing t he need for a holistic approach when designing cutting-edge Neural Fields.
****
UnScene3D: Unsupervised 3D Instance Segmentation for Indoor Scenes
David Rozenberszki, Or Litany, Angela Dai; Proceedings of the IEEE/CVF Conferenc e on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 19957-19967
3D instance segmentation is fundamental to geometric understanding of the world around us. Existing methods for instance segmentation of 3D scenes rely on super vision from expensive manual 3D annotations. We propose UnScene3D the first full y unsupervised 3D learning approach for class-agnostic 3D instance segmentation of indoor scans. UnScene3D first generates pseudo masks by leveraging self-super vised color and geometry features to find potential object regions. We operate o n a basis of 3D segment primitives enabling efficient representation and learnin g on high-resolution 3D data. The coarse proposals are then refined through self -training our model on its predictions. Our approach improves over state-of-the-art unsupervised 3D instance segmentation methods by more than 300% Average Prec ision score demonstrating effective instance segmentation even in challenging cl uttered 3D scenes.
****
Nearest is Not Dearest: Towards Practical Defense against Quantization-condition ed Backdoor Attacks
Boheng Li, Yishuo Cai, Haowei Li, Feng Xue, Zhifeng Li, Yiming Li; Proceedings o f the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 202 4, pp. 24523-24533
Model quantization is widely used to compress and accelerate deep neural network s. However recent studies have revealed the feasibility of weaponizing model qua ntization via implanting quantization-conditioned backdoors (QCBs). These specia l backdoors stay dormant on released full-precision models but will come into ef fect after standard quantization. Due to the peculiarity of QCBs existing defens es have minor effects on reducing their threats or are even infeasible. In this paper we conduct the first in-depth analysis of QCBs. We reveal that the activat ion of existing QCBs primarily stems from the nearest rounding operation and is closely related to the norms of neuron-wise truncation errors (i.e. the differen ce between the continuous fullprecision weights and its quantized version). Moti vated by these insights we propose Error-guided Flipped Rounding with Activation

Preservation (EFRAP) an effective and practical defense against QCBs. Specifically EFRAP learns a non-nearest rounding strategy with neuron-wise error norm and layer-wise activation preservation guidance flipping the rounding strategies of neurons crucial for backdoor effects but with minimal impact on clean accuracy. Extensive evaluations on benchmark datasets demonstrate that our EFRAP can defeat state-of-the-art QCB attacks under various settings. Code is available here.

DiffAvatar: Simulation-Ready Garment Optimization with Differentiable Simulation
Yifei Li, Hsiao-yu Chen, Egor Larionov, Nikolaos Sarafianos, Wojciech Matusik, Tuur Stuyck; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 4368-4378
The realism of digital avatars is crucial in enabling telepresence applications with self-expression and customization. While physical simulations can produce realistic motions for clothed humans they require high-quality garment assets with associated physical parameters for cloth simulations. However manually creating these assets and calibrating their parameters is labor-intensive and requires specialized expertise. Current methods focus on reconstructing geometry but don't generate complete assets for physics-based applications. To address this gap we propose DiffAvatar a novel approach that performs body and garment co-optimization using differentiable simulation. By integrating physical simulation into the optimization loop and accounting for the complex nonlinear behavior of cloth and its intricate interaction with the body our framework recovers body and garment geometry and extracts important material parameters in a physically plausible way. Our experiments demonstrate that our approach generates realistic clothing and body shape suitable for downstream applications. We provide additional insights and results on our webpage: people.csail.mit.edu/liyifei/publication/diffavatar.

AlignSAM: Aligning Segment Anything Model to Open Context via Reinforcement Learning
Duojun Huang, Xinyu Xiong, Jie Ma, Jichang Li, Zequn Jie, Lin Ma, Guanbin Li; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 3205-3215
Powered by massive curated training data Segment Anything Model (SAM) has demonstrated its impressive generalization capabilities in open-world scenarios with the guidance of prompts. However the vanilla SAM is class-agnostic and heavily relies on user-provided prompts to segment objects of interest. Adapting this method to diverse tasks is crucial for accurate target identification and to avoid suboptimal segmentation results. In this paper we propose a novel framework termed AlignSAM designed for automatic prompting for aligning SAM to an open context through reinforcement learning. Anchored by an agent AlignSAM enables the generality of the SAM model across diverse downstream tasks while keeping its parameters frozen. Specifically AlignSAM initiates a prompting agent to iteratively refine segmentation predictions by interacting with the foundational model. It integrates a reinforcement learning policy network to provide informative prompts to the foundational models. Additionally a semantic recalibration module is introduced to provide fine-grained labels of prompts enhancing the model's proficiency in handling tasks encompassing explicit and implicit semantics. Experiments conducted on various challenging segmentation tasks among existing foundation models demonstrate the superiority of the proposed AlignSAM over state-of-the-art approaches. Project page: https://github.com/Duojun-Huang/AlignSAM-CVPR2024.

A Simple Recipe for Language-guided Domain Generalized Segmentation
Mohammad Fahes, Tuan-Hung Vu, Andrei Bursuc, Patrick Pérez, Raoul de Charette; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 23428-23437
Generalization to new domains not seen during training is one of the long-standing challenges in deploying neural networks in real-world applications. Existing generalization techniques either necessitate external images for augmentation and/or aim at learning invariant representations by imposing various alignment con

straints. Large-scale pretraining has recently shown promising generalization ca
pabilities along with the potential of binding different modalities. For instanc
e the advent of vision-language models like CLIP has opened the doorway for visi
on models to exploit the textual modality. In this paper we introduce a simple f
ramework for generalizing semantic segmentation networks by employing language a
s the source of randomization. Our recipe comprises three key ingredients: (i) t
he preservation of the intrinsic CLIP robustness through minimal fine-tuning (ii
) language-driven local style augmentation and (iii) randomization by locally mi
xing the source and augmented styles during training. Extensive experiments repo
rt state-of-the-art results on various generalization benchmarks.

Learning Spatial Adaptation and Temporal Coherence in Diffusion Models for Video
 Super-Resolution
Zhikai Chen, Fuchen Long, Zhaofan Qiu, Ting Yao, Wengang Zhou, Jiebo Luo, Tao Me
i; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recogni
tion (CVPR), 2024, pp. 9232-9241
Diffusion models are just at a tipping point for image super-resolution task. Ne
vertheless it is not trivial to capitalize on diffusion models for video super-r
esolution which necessitates not only the preservation of visual appearance from
 low-resolution to high-resolution videos but also the temporal consistency acro
ss video frames. In this paper we propose a novel approach pursuing Spatial Adap
tation and Temporal Coherence (SATeCo) for video super-resolution. SATeCo pivots
 on learning spatial-temporal guidance from low-resolution videos to calibrate b
oth latent-space high-resolution video denoising and pixel-space video reconstru
ction. Technically SATeCo freezes all the parameters of the pre-trained UNet and
 VAE and only optimizes two deliberately-designed spatial feature adaptation (SF
A) and temporal feature alignment (TFA) modules in the decoder of UNet and VAE.
SFA modulates frame features via adaptively estimating affine parameters for eac
h pixel guaranteeing pixel-wise guidance for high-resolution frame synthesis. TF
A delves into feature interaction within a 3D local window (tubelet) through sel
f-attention and executes cross-attention between tubelet and its low-resolution
counterpart to guide temporal feature alignment. Extensive experiments conducted
 on the REDS4 and Vid4 datasets demonstrate the effectiveness of our approach.

Multiagent Multitraversal Multimodal Self-Driving: Open MARS Dataset
Yiming Li, Zhiheng Li, Nuo Chen, Moonjun Gong, Zonglin Lyu, Zehong Wang, Peili J
iang, Chen Feng; Proceedings of the IEEE/CVF Conference on Computer Vision and P
attern Recognition (CVPR), 2024, pp. 22041-22051
Large-scale datasets have fueled recent advancements in AI-based autonomous vehi
cle research. However these datasets are usually collected from a single vehicle
's one-time pass of a certain location lacking multiagent interactions or repeat
ed traversals of the same place. Such information could lead to transformative e
nhancements in autonomous vehicles' perception prediction and planning capabilit
ies. To bridge this gap in collaboration with the self-driving company May Mobil
ity we present the MARS dataset which unifies scenarios that enable MultiAgent m
ultitraveRSal and multimodal autonomous vehicle research. More specifically MARS
 is collected with a fleet of autonomous vehicles driving within a certain geogr
aphical area. Each vehicle has its own route and different vehicles may appear a
t nearby locations. Each vehicle is equipped with a LiDAR and surround-view RGB
cameras. We curate two subsets in MARS: one facilitates collaborative driving wi
th multiple vehicles simultaneously present at the same location and the other e
nables memory retrospection through asynchronous traversals of the same location
 by multiple vehicles. We conduct experiments in place recognition and neural re
construction. More importantly MARS introduces new research opportunities and ch
allenges such as multitraversal 3D reconstruction multiagent perception and unsu
pervised object discovery. Our data and codes can be found at https://ai4ce.gith
ub.io/MARS/.

From Variance to Veracity: Unbundling and Mitigating Gradient Variance in Differ
entiable Bundle Adjustment Layers

Swaminathan Gurumurthy, Karnik Ram, Bingqing Chen, Zachary Manchester, Zico Kolter; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 27507-27516

Various pose estimation and tracking problems in robotics can be decomposed into a correspondence estimation problem (often computed using a deep network) followed by a weighted least squares optimization problem to solve for the poses. Recent work has shown that coupling the two problems by iteratively refining one conditioned on the other's output yields SOTA results across domains. However training these models has proved challenging requiring a litany of tricks to stabilize and speed up training. In this work we take the visual odometry problem as an example and identify three plausible causes: (1) flow loss interference (2) linearization errors in the bundle adjustment (BA) layer and (3) dependence of weight gradients on the BA residual. We show how these issues result in noisy and higher variance gradients potentially leading to a slow down in training and instabilities. We then propose a simple solution to reduce the gradient variance by using the weights predicted by the network in the inner optimization loop to also weight the correspondence objective in the training problem. This helps the training objective 'focus' on the more important points thereby reducing the variance and mitigating the influence of outliers. We show that the resulting method leads to faster training and can be more flexibly trained in varying training setups without sacrificing performance. In particular we show 2-2.5x training speed ups over a baseline visual odometry model we modify.

Denoising Point Clouds in Latent Space via Graph Convolution and Invertible Neural Network

Aihua Mao, Biao Yan, Zijing Ma, Ying He; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 5768-5777

Point clouds frequently contain noise and outliers presenting obstacles for downstream applications. In this work we introduce a novel denoising method for point clouds. By leveraging the latent space we explicitly uncover noise components allowing for the extraction of a clean latent code. This in turn facilitates the restoration of clean points via inverse transformation. A key component in our network is a new multi-level graph convolution network for capturing rich geometric structural features at various scales from local to global. These features are then integrated into the invertible neural network which bijectively maps the latent space to guide the noise disentanglement process. Additionally we employ an invertible monotone operator to model the transformation process effectively enhancing the representation of integrated geometric features. This enhancement allows our network to precisely differentiate between noise factors and the intrinsic clean points in the latent code by projecting them onto separate channels. Both qualitative and quantitative evaluations demonstrate that our method outperforms state-of-the-art methods at various noise levels. The source code is available at https://github.com/yanbiao1/PD-LTS.

ADA-Track: End-to-End Multi-Camera 3D Multi-Object Tracking with Alternating Detection and Association

Shuxiao Ding, Lukas Schneider, Marius Cordts, Juergen Gall; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 15184-15194

Many query-based approaches for 3D Multi-Object Tracking (MOT) adopt the tracking-by-attention paradigm utilizing track queries for identity-consistent detection and object queries for identity-agnostic track spawning. Tracking-by-attention however entangles detection and tracking queries in one embedding for both the detection and tracking task which is sub-optimal. Other approaches resemble the tracking-by-detection paradigm detecting objects using decoupled track and detection queries followed by a subsequent association. These methods however do not leverage synergies between the detection and association task. Combining the strengths of both paradigms we introduce ADA-Track a novel end-to-end framework for 3D MOT from multi-view cameras. We introduce a learnable data association module based on edge-augmented cross-attention leveraging appearance and geometric fe

atures. Furthermore we integrate this association module into the decoder layer of a DETR-based 3D detector enabling simultaneous DETR-like query-to-image cross-attention for detection and query-to-query cross-attention for data association. By stacking these decoder layers queries are refined for the detection and association task alternately effectively harnessing the task dependencies. We evaluate our method on the nuScenes dataset and demonstrate the advantage of our approach compared to the two previous paradigms. Code is available at https://github.com/dsx0511/ADA-Track.

HIR-Diff: Unsupervised Hyperspectral Image Restoration Via Improved Diffusion Models
Li Pang, Xiangyu Rui, Long Cui, Hongzhong Wang, Deyu Meng, Xiangyong Cao; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 3005-3014
Hyperspectral image (HSI) restoration aims at recovering clean images from degraded observations and plays a vital role in downstream tasks. Existing model-based methods have limitations in accurately modeling the complex image characteristics with handcraft priors and deep learning-based methods suffer from poor generalization ability. To alleviate these issues this paper proposes an unsupervised HSI restoration framework with pre-trained diffusion model (HIR-Diff) which restores the clean HSIs from the product of two low-rank components i.e. the reduced image and the coefficient matrix. Specifically the reduced image which has a low spectral dimension lies in the image field and can be inferred from our improved diffusion model where a new guidance function with total variation (TV) prior is designed to ensure that the reduced image can be well sampled. The coefficient matrix can be effectively pre-estimated based on singular value decomposition (SVD) and rank-revealing QR (RRQR) factorization. Furthermore a novel exponential noise schedule is proposed to accelerate the restoration process (about 5xacceleration for denoising) with little performance decrease. Extensive experimental results validate the superiority of our method in both performance and speed on a variety of HSI restoration tasks including HSI denoising noisy HSI super-resolution and noisy HSI inpainting. The code is available at https://github.com/LiPang/HIRDiff.

Mind The Edge: Refining Depth Edges in Sparsely-Supervised Monocular Depth Estimation
Lior Talker, Aviad Cohen, Erez Yosef, Alexandra Dana, Michael Dinerstein; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 10606-10616
Monocular Depth Estimation (MDE) is a fundamental problem in computer vision with numerous applications. Recently LIDAR-supervised methods have achieved remarkable per-pixel depth accuracy in outdoor scenes. However significant errors are typically found in the proximity of depth discontinuities i.e. depth edges which often hinder the performance of depth-dependent applications that are sensitive to such inaccuracies e.g. novel view synthesis and augmented reality. Since direct supervision for the location of depth edges is typically unavailable in sparse LIDAR-based scenes encouraging the MDE model to produce correct depth edges is not straightforward. To the best of our knowledge this paper is the first attempt to address the depth edges issue for LIDAR-supervised scenes. In this work we propose to learn to detect the location of depth edges from densely-supervised synthetic data and use it to generate supervision for the depth edges in the MDE training. To quantitatively evaluate our approach and due to the lack of depth edges GT in LIDAR-based scenes we manually annotated subsets of the KITTI and the DDAD datasets with depth edges ground truth. We demonstrate significant gains in the accuracy of the depth edges with comparable per-pixel depth accuracy on several challenging datasets. Code and datasets are available at https://github.com/liortalker/MindTheEdge.

Attention-Driven Training-Free Efficiency Enhancement of Diffusion Models
Hongjie Wang, Difan Liu, Yan Kang, Yijun Li, Zhe Lin, Niraj K. Jha, Yuchen Liu;

Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 16080-16089
Diffusion models (DMs) have exhibited superior performance in generating high-quality and diverse images. However this exceptional performance comes at the cost of expensive generation process particularly due to the heavily used attention module in leading models. Existing works mainly adopt a retraining process to enhance DM efficiency. This is computationally expensive and not very scalable. To this end we introduce the Attention-driven Training-free Efficient Diffusion Model (AT-EDM) framework that leverages attention maps to perform run-time pruning of redundant tokens without the need for any retraining. Specifically for single-denoising-step pruning we develop a novel ranking algorithm Generalized Weighted Page Rank (G-WPR) to identify redundant tokens and a similarity-based recovery method to restore tokens for the convolution operation. In addition we propose a Denoising-Steps-Aware Pruning (DSAP) approach to adjust the pruning budget across different denoising timesteps for better generation quality. Extensive evaluations show that AT-EDM performs favorably against prior art in terms of efficiency (e.g. 38.8% FLOPs saving and up to 1.53x speed-up over Stable Diffusion XL) while maintaining nearly the same FID and CLIP scores as the full model.

CPR: Retrieval Augmented Generation for Copyright Protection
Aditya Golatkar, Alessandro Achille, Luca Zancato, Yu-Xiang Wang, Ashwin Swaminathan, Stefano Soatto; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 12374-12384
Retrieval Augmented Generation (RAG) is emerging as a flexible and robust technique to adapt models to private users data without training to handle credit attribution and to allow efficient machine unlearning at scale. However RAG techniques for image generation may lead to parts of the retrieved samples being copied in the model's output. To reduce risks of leaking private information contained in the retrieved set we introduce Copy-Protected generation with Retrieval (CPR) a new method for RAG with strong copyright protection guarantees in a mixed-private setting for diffusion models. CPR allows to condition the output of diffusion models on a set of retrieved images while also guaranteeing that unique identifiable information about those example is not exposed in the generated outputs. In particular it does so by sampling from a mixture of public (safe) distribution and private (user) distribution by merging their diffusion scores at inference. We prove that CPR satisfies Near Access Freeness (NAF) which bounds the amount of information an attacker may be able to extract from the generated images. We provide two algorithms for copyright protection CPR-KL and CPR-Choose. Unlike previously proposed rejection-sampling-based NAF methods our methods enable efficient copyright-protected sampling with a single run of backward diffusion. We show that our method can be applied to any pre-trained conditional diffusion model such as Stable Diffusion or unCLIP. In particular we empirically show that applying CPR on top of un- CLIP improves quality and text-to-image alignment of the generated results (81.4 to 83.17 on TIFA benchmark) while enabling credit attribution copy-right protection and deterministic constant time unlearning.
****
FreeDrag: Feature Dragging for Reliable Point-based Image Editing
Pengyang Ling, Lin Chen, Pan Zhang, Huaian Chen, Yi Jin, Jinjin Zheng; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 6860-6870
To serve the intricate and varied demands of image editing precise and flexible manipulation in image content is indispensable. Recently Drag-based editing methods have gained impressive performance. However these methods predominantly center on point dragging resulting in two noteworthy drawbacks namely "miss tracking" where difficulties arise in accurately tracking the predetermined handle points and "ambiguous tracking" where tracked points are potentially positioned in wrong regions that closely resemble the handle points. To address the above issues we propose FreeDrag a feature dragging methodology designed to free the burden on point tracking. The FreeDrag incorporates two key designs i.e. template feature via adaptive updating and line search with backtracking the former improves t

he stability against drastic content change by elaborately controlling the featu
re updating scale after each dragging while the latter alleviates the misguidanc
e from similar points by actively restricting the search area in a line. These t
wo technologies together contribute to a more stable semantic dragging with high
er efficiency. Comprehensive experimental results substantiate that our approach
 significantly outperforms pre-existing methodologies offering reliable point-ba
sed editing even in various complex scenarios.

Image-Text Co-Decomposition for Text-Supervised Semantic Segmentation
Ji-Jia Wu, Andy Chia-Hao Chang, Chieh-Yu Chuang, Chun-Pei Chen, Yu-Lun Liu, Min-
Hung Chen, Hou-Ning Hu, Yung-Yu Chuang, Yen-Yu Lin; Proceedings of the IEEE/CVF
Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 26794-26
803
This paper addresses text-supervised semantic segmentation aiming to learn a mod
el capable of segmenting arbitrary visual concepts within images by using only i
mage-text pairs without dense annotations. Existing methods have demonstrated th
at contrastive learning on image-text pairs effectively aligns visual segments w
ith the meanings of texts. We notice that there is a discrepancy between text al
ignment and semantic segmentation: A text often consists of multiple semantic co
ncepts whereas semantic segmentation strives to create semantically homogeneous
segments. To address this issue we propose a novel framework Image-Text Co-Decom
position (CoDe) where the paired image and text are jointly decomposed into a se
t of image regions and a set of word segments respectively and contrastive learn
ing is developed to enforce region-word alignment. To work with a vision-languag
e model we present a prompt learning mechanism that derives an extra representat
ion to highlight an image segment or a word segment of interest with which more
effective features can be extracted from that segment. Comprehensive experimenta
l results demonstrate that our method performs favorably against existing text-s
upervised semantic segmentation methods on six benchmark datasets.

Orchestrate Latent Expertise: Advancing Online Continual Learning with Multi-Lev
el Supervision and Reverse Self-Distillation
Hongwei Yan, Liyuan Wang, Kaisheng Ma, Yi Zhong; Proceedings of the IEEE/CVF Con
ference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 23670-23680
To accommodate real-world dynamics artificial intelligence systems need to cope
with sequentially arriving content in an online manner. Beyond regular Continual
 Learning (CL) attempting to address catastrophic forgetting with offline traini
ng of each task Online Continual Learning (OCL) is a more challenging yet realis
tic setting that performs CL in a one-pass data stream. Current OCL methods prim
arily rely on memory replay of old training samples. However a notable gap from
CL to OCL stems from the additional overfitting-underfitting dilemma associated
with the use of rehearsal buffers: the inadequate learning of new training sampl
es (underfitting) and the repeated learning of a few old training samples (overf
itting). To this end we introduce a novel approach Multi-level Online Sequential
 Experts (MOSE) which cultivates the model as stacked sub-experts integrating mu
lti-level supervision and reverse self-distillation. Supervision signals across
multiple stages facilitate appropriate convergence of the new task while gatheri
ng various strengths from experts by knowledge distillation mitigates the perfor
mance decline of old tasks. MOSE demonstrates remarkable efficacy in learning ne
w samples and preserving past knowledge through multi-level experts thereby sign
ificantly advancing OCL performance over state-of-the-art baselines (e.g. up to
7.3% on Split CIFAR-100 and 6.1% on Split Tiny-ImageNet).

Vision-and-Language Navigation via Causal Learning
Liuyi Wang, Zongtao He, Ronghao Dang, Mengjiao Shen, Chengju Liu, Qijun Chen; Pr
oceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition
(CVPR), 2024, pp. 13139-13150
In the pursuit of robust and generalizable environment perception and language u
nderstanding the ubiquitous challenge of dataset bias continues to plague vision
-and-language navigation (VLN) agents hindering their performance in unseen envi

ronments. This paper introduces the generalized cross-modal causal transformer (
GOAT) a pioneering solution rooted in the paradigm of causal inference. By delvi
ng into both observable and unobservable confounders within vision language and
history we propose the back-door and front-door adjustment causal learning (BACL
 and FACL) modules to promote unbiased learning by comprehensively mitigating po
tential spurious correlations. Additionally to capture global confounder feature
s we propose a cross-modal feature pooling (CFP) module supervised by contrastiv
e learning which is also shown to be effective in improving cross-modal represen
tations during pre-training. Extensive experiments across multiple VLN datasets
(R2R REVERIE RxR and SOON) underscore the superiority of our proposed method ove
r previous state-of-the-art approaches. Code is available at https://github.com/
CrystalSixone/VLN-GOAT.

Mitigating Object Dependencies: Improving Point Cloud Self-Supervised Learning t
hrough Object Exchange
Yanhao Wu, Tong Zhang, Wei Ke, Congpei Qiu, Sabine Süsstrunk, Mathieu Salzmann;
Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognitio
n (CVPR), 2024, pp. 23052-23061
In the realm of point cloud scene understanding particularly in indoor scenes ob
jects are arranged following human habits resulting in objects of certain semant
ics being closely positioned and displaying notable inter-object correlations. T
his can create a tendency for neural networks to exploit these strong dependenci
es bypassing the individual object patterns. To address this challenge we introd
uce a novel self-supervised learning (SSL) strategy. Our approach leverages both
 object patterns and contextual cues to produce robust features. It begins with
the formulation of an object-exchanging strategy where pairs of objects with com
parable sizes are exchanged across different scenes effectively disentangling th
e strong contextual dependencies. Subsequently we introduce a context-aware feat
ure learning strategy which encodes object patterns without relying on their spe
cific context by aggregating object features across various scenes. Our extensiv
e experiments demonstrate the superiority of our method over existing SSL techni
ques further showing its better robustness to environmental changes. Moreover we
 showcase the applicability of our approach by transferring pre-trained models t
o diverse point cloud datasets.

Confronting Ambiguity in 6D Object Pose Estimation via Score-Based Diffusion on
SE(3)
Tsu-Ching Hsiao, Hao-Wei Chen, Hsuan-Kung Yang, Chun-Yi Lee; Proceedings of the
IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp.
 352-362
Addressing pose ambiguity in 6D object pose estimation from single RGB images pr
esents a significant challenge particularly due to object symmetries or occlusio
ns. In response we introduce a novel score-based diffusion method applied to the
 SE(3) group marking the first application of diffusion models to SE(3) within t
he image domain specifically tailored for pose estimation tasks. Extensive evalu
ations demonstrate the method's efficacy in handling pose ambiguity mitigating p
erspective-induced ambiguity and showcasing the robustness of our surrogate Stei
n score formulation on SE(3). This formulation not only improves the convergence
 of denoising process but also enhances computational efficiency. Thus we pionee
r a promising strategy for 6D object pose estimation.
****
Visual Anagrams: Generating Multi-View Optical Illusions with Diffusion Models
Daniel Geng, Inbum Park, Andrew Owens; Proceedings of the IEEE/CVF Conference on
 Computer Vision and Pattern Recognition (CVPR), 2024, pp. 24154-24163
We address the problem of synthesizing multi-view optical illusions: images that
 change appearance upon a transformation such as a flip or rotation. We propose
a simple zero-shot method for obtaining these illusions from off-the-shelf text-
to-image diffusion models. During the reverse diffusion process we estimate the
noise from different views of a noisy image and then combine these noise estimat
es together and denoise the image. A theoretical analysis suggests that this met

hod works precisely for views that can be written as orthogonal transformations of which permutations are a subset. This leads to the idea of a visual anagram ---an image that changes appearance under some rearrangement of pixels. This includes rotations and flips but also more exotic pixel permutations such as a jigsaw rearrangement. Our approach also naturally extends to illusions with more than two views. We provide both qualitative and quantitative results demonstrating the effectiveness and flexibility of our method. Please see our project webpage for additional visualizations and results: https://dangeng.github.io/visual_anagrams/

Unveiling Parts Beyond Objects: Towards Finer-Granularity Referring Expression Segmentation
Wenxuan Wang, Tongtian Yue, Yisi Zhang, Longteng Guo, Xingjian He, Xinlong Wang, Jing Liu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 12998-13008
Referring expression segmentation (RES) aims at segmenting the foreground masks of the entities that match the descriptive natural language expression. Previous datasets and methods for classic RES task heavily rely on the prior assumption that one expression must refer to object-level targets. In this paper we take a step further to finer-grained part-level RES task. To promote the object-level RES task towards finer-grained vision-language understanding we put forward a new multi-granularity referring expression segmentation (MRES) task and construct an evaluation benchmark called RefCOCOm by manual annotations. By employing our automatic model-assisted data engine we build the largest visual grounding dataset namely MRES-32M which comprises over 32.2M high-quality masks and captions on the provided 1M images. Besides a simple yet strong model named UniRES is designed to accomplish the unified object-level and part-level grounding task. Extensive experiments on our RefCOCOm for MRES and three datasets (i.e. RefCOCO(+/g)) for classic RES task demonstrate the superiority of our method over previous state-of-the-art methods. To foster future research into fine-grained visual grounding our benchmark RefCOCOm the MRES-32M dataset and model UniRES will be publicly available at https://github.com/Rubics-Xuan/MRES.
****
DiffInDScene: Diffusion-based High-Quality 3D Indoor Scene Generation
Xiaoliang Ju, Zhaoyang Huang, Yijin Li, Guofeng Zhang, Yu Qiao, Hongsheng Li; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 4526-4535
We present DiffInDScene a novel framework for tackling the problem of high-quality 3D indoor scene generation which is challenging due to the complexity and diversity of the indoor scene geometry. Although diffusion-based generative models have previously demonstrated impressive performance in image generation and object-level 3D generation they have not yet been applied to room-level 3D generation due to their computationally intensive costs. In DiffInDScene we propose a cascaded 3D diffusion pipeline that is efficient and possesses strong generative performance for Truncated Signed Distance Function (TSDF). The whole pipeline is designed to run on a sparse occupancy space in a coarse-to-fine fashion. Inspired by KinectFusion's incremental alignment and fusion of local TSDF volumes we propose a diffusion-based SDF fusion approach that iteratively diffuses and fuses local TSDF volumes facilitating the generation of an entire room environment. The generated results demonstrate that our work is capable to achieve high-quality room generation directly in three-dimensional space starting from scratch. In addition to the scene generation the final part of DiffInDScene can be used as a post-processing module to refine the 3D reconstruction results from multi-view stereo. According to the user study the mesh quality generated by our DiffInDScene can even outperform the ground truth mesh provided by ScanNet.

MAPSeg: Unified Unsupervised Domain Adaptation for Heterogeneous Medical Image Segmentation Based on 3D Masked Autoencoding and Pseudo-Labeling
Xuzhe Zhang, Yuhao Wu, Elsa Angelini, Ang Li, Jia Guo, Jerod M. Rasmussen, Thomas G. O'Connor, Pathik D. Wadhwa, Andrea Parolin Jackowski, Hai Li, Jonathan Posn

er, Andrew F. Laine, Yun Wang; Proceedings of the IEEE/CVF Conference on Compute
r Vision and Pattern Recognition (CVPR), 2024, pp. 5851-5862
Robust segmentation is critical for deriving quantitative measures from large-sc
ale multi-center and longitudinal medical scans. Manually annotating medical sca
ns however is expensive and labor-intensive and may not always be available in e
very domain. Unsupervised domain adaptation (UDA) is a well-studied technique th
at alleviates this label-scarcity problem by leveraging available labels from an
other domain. In this study we introduce Masked Autoencoding and Pseudo-Labeling
 Segmentation (MAPSeg) a unified UDA framework with great versatility and superi
or performance for heterogeneous and volumetric medical image segmentation. To t
he best of our knowledge this is the first study that systematically reviews and
 develops a framework to tackle four different domain shifts in medical image se
gmentation. More importantly MAPSeg is the first framework that can be applied t
o centralized federated and test-time UDA while maintaining comparable performan
ce. We compare MAPSeg with previous state-of-the-art methods on a private infant
 brain MRI dataset and a public cardiac CT-MRI dataset and MAPSeg outperforms ot
hers by a large margin (10.5 Dice improvement on the private MRI dataset and 5.7
 on the public CT-MRI dataset). MAPSeg poses great practical value and can be ap
plied to real-world problems. GitHub: https://github.com/XuzheZ/MAPSeg/.

Leveraging Predicate and Triplet Learning for Scene Graph Generation
Jiankai Li, Yunhong Wang, Xiefan Guo, Ruijie Yang, Weixin Li; Proceedings of the
 IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp
. 28369-28379
Scene Graph Generation (SGG) aims to identify entities and predict the relations
hip triplets <subject predicate object> in visual scenes. Given the prevalence o
f large visual variations of subject-object pairs even in the same predicate it
can be quite challenging to model and refine predicate representations directly
across such pairs which is however a common strategy adopted by most existing SG
G methods. We observe that visual variations within the identical triplet are re
latively small and certain relation cues are shared in the same type of triplet
which can potentially facilitate the relation learning in SGG. Moreover for the
long-tail problem widely studied in SGG task it is also crucial to deal with the
 limited types and quantity of triplets in tail predicates. Accordingly in this
paper we propose a Dual-granularity Relation Modeling (DRM) network to leverage
fine-grained triplet cues besides the coarse-grained predicate ones. DRM utilize
s contexts and semantics of predicate and triplet with Dual-granularity Constrai
nts generating compact and balanced representations from two perspectives to fac
ilitate relation recognition. Furthermore a Dual-granularity Knowledge Transfer
(DKT) strategy is introduced to transfer variation from head predicates/triplets
 to tail ones aiming to enrich the pattern diversity of tail classes to alleviat
e the long-tail problem. Extensive experiments demonstrate the effectiveness of
our method which establishes new state-of-the-art performance on Visual Genome O
pen Image and GQA datasets. Our code is available at https://github.com/jkli1998
/DRM.

DaReNeRF: Direction-aware Representation for Dynamic Scenes
Ange Lou, Benjamin Planche, Zhongpai Gao, Yamin Li, Tianyu Luan, Hao Ding, Terre
nce Chen, Jack Noble, Ziyan Wu; Proceedings of the IEEE/CVF Conference on Comput
er Vision and Pattern Recognition (CVPR), 2024, pp. 5031-5042
Addressing the intricate challenge of modeling and re-rendering dynamic scenes m
ost recent approaches have sought to simplify these complexities using plane-bas
ed explicit representations overcoming the slow training time issues associated
with methods like Neural Radiance Fields (NeRF) and implicit representations. Ho
wever the straightforward decomposition of 4D dynamic scenes into multiple 2D pl
ane-based representations proves insufficient for re-rendering high-fidelity sce
nes with complex motions. In response we present a novel direction-aware represe
ntation (DaRe) approach that captures scene dynamics from six different directio
ns. This learned representation undergoes an inverse dual-tree complex wavelet t
ransformation (DTCWT) to recover plane-based information. DaReNeRF computes feat

ures for each space-time point by fusing vectors from these recovered planes. Co
mbining DaReNeRF with a tiny MLP for color regression and leveraging volume rend
ering in training yield state-of-the-art performance in novel view synthesis for
 complex dynamic scenes. Notably to address redundancy introduced by the six rea
l and six imaginary direction-aware wavelet coefficients we introduce a trainabl
e masking approach mitigating storage issues without significant performance dec
line. Moreover DaReNeRF maintains a 2x reduction in training time compared to pr
ior art while delivering superior performance.

SfmCAD: Unsupervised CAD Reconstruction by Learning Sketch-based Feature Modelin
g Operations
Pu Li, Jianwei Guo, Huibin Li, Bedrich Benes, Dong-Ming Yan; Proceedings of the
IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp.
 4671-4680
This paper introduces SfmCAD a novel unsupervised network that reconstructs 3D s
hapes by learning the Sketch-based Feature Modeling operations commonly used in
modern CAD workflows. Given a 3D shape represented as voxels SfmCAD learns a neu
ral-typed sketch+path parameterized representation including 2D sketches of feat
ure primitives and their 3D sweeping paths without supervision for inferring fea
ture-based CAD programs. SfmCAD employs 2D sketches for local detail representat
ion and 3D paths to capture the overall structure achieving a clear separation b
etween shape details and structure. This conversion into parametric forms enable
s users to seamlessly adjust the shape's geometric and structural features thus
enhancing interpretability and user control. We demonstrate the effectiveness of
 our method by applying SfmCAD to many different types of objects such as CAD pa
rts ShapeNet objects and tree shapes. Extensive comparisons show that SfmCAD pro
duces compact and faithful 3D reconstructions with superior quality compared to
alternatives. The code is released at https://github.com/BunnySoCrazy/SfmCAD.

Tuning Stable Rank Shrinkage: Aiming at the Overlooked Structural Risk in Fine-t
uning
Sicong Shen, Yang Zhou, Bingzheng Wei, Eric I-Chao Chang, Yan Xu; Proceedings of
 the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024
, pp. 28474-28484
Existing fine-tuning methods for computer vision tasks primarily focus on re-wei
ghting the knowledge learned from the source domain during pre-training. They ai
m to retain beneficial knowledge for the target domain while suppressing unfavor
able knowledge. During the pre-training and fine-tuning stages there is a notabl
e disparity in the data scale. Consequently it is theoretically necessary to emp
loy a model with reduced complexity to mitigate the potential structural risk. H
owever our empirical investigation in this paper reveals that models fine-tuned
using existing methods still manifest a high level of model complexity inherited
 from the pre-training stage leading to a suboptimal stability and generalizatio

n ability. This phenomenon indicates an issue that has been overlooked in fine-tuning: Structural Risk Minimization. To address this issue caused by data scale disparity during the fine-tuning stage we propose a simple yet effective approach called Tuning Stable Rank Shrinkage (TSRS). TSRS mitigates the structural risk during the fine-tuning stage by constraining the noise sensitivity of the target model based on stable rank theories. Through extensive experiments we demonstrate that incorporating TSRS into fine-tuning methods leads to improved generalization ability on various tasks regardless of whether the neural networks are based on convolution or transformer architectures. Additionally empirical analysis reveals that TSRS enhances the robustness convexity and smoothness of the loss landscapes in fine-tuned models. Code is available at https://github.com/WitGotFlg/TSRS.

Differentiable Display Photometric Stereo
Seokjun Choi, Seungwoo Yoon, Giljoo Nam, Seungyong Lee, Seung-Hwan Baek; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 11831-11840
Photometric stereo leverages variations in illumination conditions to reconstruct surface normals. Display photometric stereo which employs a conventional monitor as an illumination source has the potential to overcome limitations often encountered in bulky and difficult-to-use conventional setups. In this paper we present differentiable display photometric stereo (DDPS) addressing an often overlooked challenge in display photometric stereo: the design of display patterns. Departing from using heuristic display patterns DDPS learns the display patterns that yield accurate normal reconstruction for a target system in an end-to-end manner. To this end we propose a differentiable framework that couples basis-illumination image formation with analytic photometric-stereo reconstruction. The differentiable framework facilitates the effective learning of display patterns via auto-differentiation. Also for training supervision we propose to use 3D printing for creating a real-world training dataset enabling accurate reconstruction on the target real-world setup. Finally we exploit that conventional LCD monitors emit polarized light which allows for the optical separation of diffuse and specular reflections when combined with a polarization camera leading to accurate normal reconstruction. Extensive evaluation of DDPS shows improved normal-reconstruction accuracy compared to heuristic patterns and demonstrates compelling properties such as robustness to pattern initialization calibration errors and simplifications in image formation and reconstruction.

In-distribution Public Data Synthesis with Diffusion Models for Differentially Private Image Classification
Jinseong Park, Yujin Choi, Jaewook Lee; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 12236-12246
To alleviate the utility degradation of deep learning image classification with differential privacy (DP) employing extra public data or pre-trained models has been widely explored. Recently the use of in-distribution public data has been investigated where tiny subsets of datasets are released publicly. In this paper we investigate a framework that leverages recent diffusion models to amplify the information of public data. Subsequently we identify data diversity and generalization gap between public and private data as critical factors addressing the limited public data. While assuming 4% of training data as public our method achieves 85.48% on CIFAR-10 with a privacy budget of ?=2 without employing extra public data for training.

Learning Degradation-unaware Representation with Prior-based Latent Transformations for Blind Face Restoration
Lianxin Xie, Csbingbing Zheng, Wen Xue, Le Jiang, Cheng Liu, Si Wu, Hau San Wong; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 9120-9129
Blind face restoration focuses on restoring high-fidelity details from images subjected to complex and unknown degradations while preserving identity informatio

n. In this paper we present a Prior-based Latent Transformation approach (PLTrans) which is specifically designed to learn a degradation-unaware representation thereby allowing the restoration network to effectively generalize to real-world degradation. Toward this end PLTrans learns a degradation-unaware query via a latent diffusion-based regularization module. Furthermore conditioned on the features of a degraded face image a latent dictionary that captures the priors of HQ face images is leveraged to refine the features by mapping the top-d nearest elements. The refined version will be used to build key and value for the cross-attention computation which is tailored to each degraded image and exhibits reduced sensitivity to different degradation factors. Conditioned on the resulting representation we train a decoding network that synthesizes face images with authentic details and identity preservation. Through extensive experiments we verify the effectiveness of the design elements and demonstrate the generalization ability of our proposed approach for both synthetic and unknown degradations. We finally demonstrate the applicability of PLTrans in other vision tasks.

LSK3DNet: Towards Effective and Efficient 3D Perception with Large Sparse Kernels
Tuo Feng, Wenguan Wang, Fan Ma, Yi Yang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 14916-14927
Autonomous systems need to process large-scale sparse and irregular point clouds with limited compute resources. Consequently it is essential to develop LiDAR perception methods that are both efficient and effective. Although naively enlarging 3D kernel size can enhance performance it will also lead to a cubically-increasing overhead. Therefore it is crucial to develop streamlined 3D large kernel designs that eliminate redundant weights and work effectively with larger kernels. In this paper we propose an efficient and effective Large Sparse Kernel 3D Neural Network (LSK3DNet) that leverages dynamic pruning to amplify the 3D kernel size. Our method comprises two core components: Spatial-wise Dynamic Sparsity (SDS) and Channel-wise Weight Selection (CWS). SDS dynamically prunes and regrows volumetric weights from the beginning to learn a large sparse 3D kernel. It not only boosts performance but also significantly reduces model size and computational cost. Moreover CWS selects the most important channels for 3D convolution during training and subsequently prunes the redundant channels to accelerate inference for 3D vision tasks. We demonstrate the effectiveness of LSK3DNet on three benchmark datasets and five tracks compared with classical models and large kernel designs. Notably LSK3DNet achieves the state-of-the-art performance on SemanticKITTI (i.e. 75.6% on single-scan and 63.4% on multi-scan) with roughly 40% model size reduction and 60% computing operations reduction compared to the naive large 3D kernel model.

Faces that Speak: Jointly Synthesising Talking Face and Speech from Text
Youngjoon Jang, Ji-Hoon Kim, Junseok Ahn, Doyeop Kwak, Hong-Sun Yang, Yoon-Cheol Ju, Il-Hwan Kim, Byeong-Yeol Kim, Joon Son Chung; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 8818-8828
The goal of this work is to simultaneously generate natural talking faces and speech outputs from text. We achieve this by integrating Talking Face Generation (TFG) and Text-to-Speech (TTS) systems into a unified framework. We address the main challenges of each task: (1) generating a range of head poses representative of real-world scenarios and (2) ensuring voice consistency despite variations in facial motion for the same identity. To tackle these issues we introduce a motion sampler based on conditional flow matching which is capable of high-quality motion code generation in an efficient way. Moreover we introduce a novel conditioning method for the TTS system which utilises motion-removed features from the TFG model to yield uniform speech outputs. Our extensive experiments demonstrate that our method effectively creates natural-looking talking faces and speech that accurately match the input text. To our knowledge this is the first effort to build a multimodal synthesis system that can generalise to unseen identities.

Diversified and Personalized Multi-rater Medical Image Segmentation

Yicheng Wu, Xiangde Luo, Zhe Xu, Xiaoqing Guo, Lie Ju, Zongyuan Ge, Wenjun Liao, Jianfei Cai; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 11470-11479
Annotation ambiguity due to inherent data uncertainties such as blurred boundaries in medical scans and different observer expertise and preferences has become a major obstacle for training deep-learning based medical image segmentation models. To address it the common practice is to gather multiple annotations from different experts leading to the setting of multi-rater medical image segmentation. Existing works aim to either merge different annotations into the "groundtruth" that is often unattainable in numerous medical contexts or generate diverse results or produce personalized results corresponding to individual expert raters. Here we bring up a more ambitious goal for multi-rater medical image segmentation i.e. obtaining both diversified and personalized results. Specifically we propose a two-stage framework named D-Persona (first Diversification and then Personalization). In Stage I we exploit multiple given annotations to train a Probabilistic U-Net model with a bound-constrained loss to improve the prediction diversity. In this way a common latent space is constructed in Stage I where different latent codes denote diversified expert opinions. Then in Stage II we design multiple attention-based projection heads to adaptively query the corresponding expert prompts from the shared latent space and then perform the personalized medical image segmentation. We evaluated the proposed model on our in-house Nasopharyngeal Carcinoma dataset and the public lung nodule dataset (i.e. LIDC-IDRI). Extensive experiments demonstrated our D-Persona can provide diversified and personalized results at the same time achieving new SOTA performance for multi-rater medical image segmentation. Our code will be released at https://github.com/ycwu1997/D-Persona.

Towards Automatic Power Battery Detection: New Challenge Benchmark Dataset and Baseline
Xiaoqi Zhao, Youwei Pang, Zhenyu Chen, Qian Yu, Lihe Zhang, Hanqi Liu, Jiaming Zuo, Huchuan Lu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 22020-22029
We conduct a comprehensive study on a new task named power battery detection (PBD) which aims to localize the dense cathode and anode plates endpoints from X-ray images to evaluate the quality of power batteries. Existing manufacturers usually rely on human eye observation to complete PBD which makes it difficult to balance the accuracy and efficiency of detection. To address this issue and drive more attention into this meaningful task we first elaborately collect a dataset called X-ray PBD which has 1500 diverse X-ray images selected from thousands of power batteries of 5 manufacturers with 7 different visual interference. Then we propose a novel segmentation-based solution for PBD termed multi-dimensional collaborative network (MDCNet). With the help of line and counting predictors the representation of the point segmentation branch can be improved at both semantic and detail aspects. Besides we design an effective distance-adaptive mask generation strategy which can alleviate the visual challenge caused by the inconsistent distribution density of plates to provide MDCNet with stable supervision. Without any bells and whistles our segmentation-based MDCNet consistently outperforms various other corner detection crowd counting and general/tiny object detection-based solutions making it a strong baseline that can help facilitate future research in PBD. Finally we share some potential difficulties and works for future researches. The source code and datasets will be publicly available at \href https://github.com/Xiaoqi-Zhao-DLUT/X-ray-PBD X-ray PBD .

AVFF: Audio-Visual Feature Fusion for Video Deepfake Detection
Trevine Oorloff, Surya Koppisetti, Nicolò Bonettini, Divyaraj Solanki, Ben Colman, Yaser Yacoob, Ali Shahriyari, Gaurav Bharaj; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 27102-27112
With the rapid growth in deepfake video content we require improved and generalizable methods to detect them. Most existing detection methods either use uni-modal cues or rely on supervised training to capture the dissonance between the aud

io and visual modalities. While the former disregards the audio-visual correspon dences entirely the latter predominantly focuses on discerning audio-visual cues within the training corpus thereby potentially overlooking correspondences that can help detect unseen deepfakes. We present Audio-Visual Feature Fusion (AVFF) a two-stage cross-modal learning method that explicitly captures the correspond ence between the audio and visual modalities for improved deepfake detection. Th e first stage pursues representation learning via self-supervision on real video s to capture the intrinsic audio-visual correspondences. To extract rich cross-m odal representations we use contrastive learning and autoencoding objectives and introduce a novel audio-visual complementary masking and feature fusion strateg y. The learned representations are tuned in the second stage where deepfake clas sification is pursued via supervised learning on both real and fake videos. Exte nsive experiments and analysis suggest that our novel representation learning pa radigm is highly discriminative in nature. We report 98.6% accuracy and 99.1% AU C on the FakeAVCeleb dataset outperforming the current audio-visual state-of-the -art by 14.9% and 9.9% respectively.

Discover and Mitigate Multiple Biased Subgroups in Image Classifiers
Zeliang Zhang, Mingqian Feng, Zhiheng Li, Chenliang Xu; Proceedings of the IEEE/ CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 1090 6-10915
Machine learning models can perform well on in-distribution data but often fail on biased subgroups that are underrepresented in the training data hindering the robustness of models for reliable applications. Such subgroups are typically un known due to the absence of subgroup labels. Discovering biased subgroups is the key to understanding models' failure modes and further improving models' robust ness. Most previous works of subgroup discovery make an implicit assumption that models only underperform on a single biased subgroup which does not hold on in- the-wild data where multiple biased subgroups exist. In this work we propose Dec omposition Interpretation and Mitigation (DIM) a novel method to address a more challenging but also more practical problem of discovering multiple biased subgr oups in image classifiers. Our approach decomposes the image features into multi ple components that represent multiple subgroups. This decomposition is achieved via a bilinear dimension reduction method Partial Least Square (PLS) guided by useful supervision from the image classifier. We further interpret the semantic meaning of each subgroup component by generating natural language descriptions u sing vision-language foundation models. Finally DIM mitigates multiple biased su bgroups simultaneously via two strategies including the data- and model-centric strategies. Extensive experiments on CIFAR-100 and Breeds datasets demonstrate t he effectiveness of DIM in discovering and mitigating multiple biased subgroups. Furthermore DIM uncovers the failure modes of the classifier on Hard ImageNet s howcasing its broader applicability to understanding model bias in image classif iers.

DiffusionRegPose: Enhancing Multi-Person Pose Estimation using a Diffusion-Based End-to-End Regression Approach
Dayi Tan, Hansheng Chen, Wei Tian, Lu Xiong; Proceedings of the IEEE/CVF Confere nce on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 2230-2239
This paper presents the DiffusionRegPose a novel approach to multi-person pose e stimation that converts a one-stage end-to-end keypoint regression model into a diffusion-based sampling process. Existing one-stage deterministic regression me thods though efficient are often prone to missed or false detections in crowded or occluded scenes due to their inability to reason pose ambiguity. To address t hese challenges we handle ambiguous poses in a generative fashion i.e. sampling from the image-conditioned pose distributions characterized by a diffusion proba bilistic model. Specifically with initial pose tokens extracted from the image n oisy pose candidates are progressively refined by interacting with the initial t okens via attention layers. Extensive evaluations on the COCO and CrowdPose data sets show that DiffusionRegPose clearly improves the pose accuracy in crowded sc enarios as evidenced by a notable 4.0 AP increase in the AP_H metric on the Crow

dPose dataset. This demonstrates the model's potential for robust and precise human pose estimation in real-world applications.

Memory-Scalable and Simplified Functional Map Learning
Robin Magnet, Maks Ovsjanikov; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 4041-4050
Deep functional maps have emerged in recent years as a prominent learning-based framework for non-rigid shape matching problems. While early methods in this domain only focused on learning in the functional domain the latest techniques have demonstrated that by promoting consistency between functional and pointwise maps leads to significant improvements in accuracy. Unfortunately existing approaches rely heavily on the computation of large dense matrices arising from soft pointwise maps which compromises their efficiency and scalability. To address this limitation we introduce a novel memory-scalable and efficient functional map learning pipeline. By leveraging the specific structure of functional maps we offer the possibility to achieve identical results without ever storing the pointwise map in memory. Furthermore based on the same approach we present a differentiable map refinement layer adapted from an existing axiomatic refinement algorithm. Unlike many functional map learning methods which use this algorithm at a post-processing step ours can be easily used at train time enabling to enforce consistency between the refined and initial versions of the map. Our resulting approach is both simpler more efficient and more numerically stable by avoiding differentiation through a linear system while achieving close to state-of-the-art results in challenging scenarios.

X-MIC: Cross-Modal Instance Conditioning for Egocentric Action Generalization
Anna Kukleva, Fadime Sener, Edoardo Remelli, Bugra Tekin, Eric Sauser, Bernt Schiele, Shugao Ma; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 26364-26373
Lately there has been growing interest in adapting vision-language models (VLMs) to image and third-person video classification due to their success in zero-shot recognition. However the adaptation of these models to egocentric videos has been largely unexplored. To address this gap we propose a simple yet effective cross-modal adaptation framework which we call X-MIC. Using a video adapter our pipeline learns to align frozen text embeddings to each egocentric video directly in the shared embedding space. Our novel adapter architecture retains and improves generalization of the pre-trained VLMs by disentangling learnable temporal modeling and frozen visual encoder. This results in an enhanced alignment of text embeddings to each egocentric video leading to a significant improvement in cross-dataset generalization. We evaluate our approach on the Epic-Kitchens Ego4D and EGTEA datasets for fine-grained cross-dataset action generalization demonstrating the effectiveness of our method.

ExMap: Leveraging Explainability Heatmaps for Unsupervised Group Robustness to Spurious Correlations
Rwiddhi Chakraborty, Adrian Sletten, Michael C. Kampffmeyer; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 12017-12026
Group robustness strategies aim to mitigate learned biases in deep learning models that arise from spurious correlations present in their training datasets. However most existing methods rely on the access to the label distribution of the groups which is time-consuming and expensive to obtain. As a result unsupervised group robustness strategies are sought. Based on the insight that a trained model's classification strategies can be inferred accurately based on explainability heatmaps we introduce ExMap an unsupervised two stage mechanism designed to enhance group robustness in traditional classifiers. ExMap utilizes a clustering module to infer pseudo-labels based on a model's explainability heatmaps which are then used during training in lieu of actual labels. Our empirical studies validate the efficacy of ExMap - We demonstrate that it bridges the per- formance gap with its supervised counterparts and outperforms existing partially supervised

and unsupervised methods. Additionally ExMap can be seamlessly integrated with e xisting group robustness learning strategies. Finally we demonstrate its potenti al in tackling the emerging issue of multiple shortcut mitigation

Stratified Avatar Generation from Sparse Observations
Han Feng, Wenchao Ma, Quankai Gao, Xianwei Zheng, Nan Xue, Huijuan Xu; Proceedin gs of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 153-163
Estimating 3D full-body avatars from AR/VR devices is essential for creating imm ersive experiences in AR/VR applications. This task is challenging due to the li mited input from Head Mounted Devices which capture only sparse observations fro m the head and hands. Predicting the full-body avatars particularly the lower bo dy from these sparse observations presents significant difficulties. In this pap er we are inspired by the inherent property of the kinematic tree defined in the Skinned Multi-Person Linear (SMPL) model where the upper body and lower body sh are only one common ancestor node bringing the potential of decoupled reconstruc tion. We propose a stratified approach to decouple the conventional full-body av atar reconstruction pipeline into two stages with the reconstruction of the uppe r body first and a subsequent reconstruction of the lower body conditioned on th e previous stage. To implement this straightforward idea we leverage the latent diffusion model as a powerful probabilistic generator and train it to follow the latent distribution of decoupled motions explored by a VQ-VAE encoder-decoder m odel. Extensive experiments on AMASS mocap dataset demonstrate our state-of-the- art performance in the reconstruction of full-body motions.

Learning to Segment Referred Objects from Narrated Egocentric Videos
Yuhan Shen, Huiyu Wang, Xitong Yang, Matt Feiszli, Ehsan Elhamifar, Lorenzo Torr esani, Effrosyni Mavroudi; Proceedings of the IEEE/CVF Conference on Computer Vi sion and Pattern Recognition (CVPR), 2024, pp. 14510-14520
Egocentric videos provide a first-person perspective of the wearer's activities involving simultaneous interactions with multiple objects. In this work we propo se the task of weakly-supervised Narration-based Video Object Segmentation (NVOS). Given an egocentric video clip and a narration of the wearer's activities our aim is to segment object instances mentioned in the narration without using any spatial annotations during training. Existing weakly-supervised video object gr ounding methods typically yield bounding boxes for referred objects. In contrast we propose ROSA a weakly-supervised pixel-level grounding framework learning al ignments between referred objects and segmentation mask proposals. Our model har nesses vision-language models pre-trained on image-text pairs to embed region ma sks and object phrases. During training we combine (a) a video-narration contras tive loss that implicitly supervises the alignment between regions and phrases a nd (b) a region-phrase contrastive loss based on inferred latent alignments. To address the lack of annotated NVOS datasets in egocentric videos we create a new

evaluation benchmark VISOR-NVOS leveraging existing annotations of segmentation masks from VISOR alongside 14.6k newly-collected object-based video clip narrations. Our approach achieves state-of-the-art zero-shot pixel-level grounding performance compared to strong baselines under similar supervision. Additionally we demonstrate generalization capabilities for zero-shot video object grounding on YouCook2 a third-person instructional video dataset.
****
Rewrite the Stars
Xu Ma, Xiyang Dai, Yue Bai, Yizhou Wang, Yun Fu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 5694-5703
Recent studies have drawn attention to the untapped potential of the "star operation" (element-wise multiplication) in network design. While intuitive explanations abound the foundational rationale behind its application remains largely unexplored. Our study attempts to reveal the star operation's ability of mapping inputs into high-dimensional non-linear feature spaces--akin to kernel tricks--without widening the network. We further introduce StarNet a simple yet powerful prototype demonstrating impressive performance and low latency under compact network structure and efficient budget. Like stars in the sky the star operation appears unremarkable but holds a vast universe of potential. Our work encourages further exploration across tasks with codes available at https://github.com/ma-xu/Rewrite-the-Stars.

Adapting Visual-Language Models for Generalizable Anomaly Detection in Medical Images
Chaoqin Huang, Aofan Jiang, Jinghao Feng, Ya Zhang, Xinchao Wang, Yanfeng Wang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 11375-11385
Recent advancements in large-scale visual-language pre-trained models have led to significant progress in zero-/few-shot anomaly detection within natural image domains. However the substantial domain divergence between natural and medical images limits the effectiveness of these methodologies in medical anomaly detection. This paper introduces a novel lightweight multi-level adaptation and comparison framework to repurpose the CLIP model for medical anomaly detection. Our approach integrates multiple residual adapters into the pre-trained visual encoder enabling a stepwise enhancement of visual features across different levels. This multi-level adaptation is guided by multi-level pixel-wise visual-language feature alignment loss functions which recalibrate the model's focus from object semantics in natural imagery to anomaly identification in medical images. The adapted features exhibit improved generalization across various medical data types even in zero-shot scenarios where the model encounters unseen medical modalities and anatomical regions during training. Our experiments on medical anomaly detection benchmarks demonstrate that our method significantly surpasses current state-of-the-art models with an average AUC improvement of 6.24% and 7.33% for anomaly classification 2.03% and 2.37% for anomaly segmentation under the zero-shot and few-shot settings respectively. Source code is available at: https://github.com/MediaBrain-SJTU/MVFA-AD

AV-RIR: Audio-Visual Room Impulse Response Estimation
Anton Ratnarajah, Sreyan Ghosh, Sonal Kumar, Purva Chiniya, Dinesh Manocha; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 27164-27175
Accurate estimation of Room Impulse Response (RIR) which captures an environment's acoustic properties is important for speech processing and AR/VR applications. We propose AV-RIR a novel multi-modal multi-task learning approach to accurately estimate the RIR from a given reverberant speech signal and the visual cues of its corresponding environment. AV-RIR builds on a novel neural codec-based architecture that effectively captures environment geometry and materials properties and solves speech dereverberation as an auxiliary task by using multi-task learning. We also propose Geo-Mat features that augment material information into visual cues and CRIP that improves late reverberation components in the estimated

RIR via image-to-RIR retrieval by 86%. Empirical results show that AV-RIR quantitatively outperforms previous audio-only and visual-only approaches by achieving 36% - 63% improvement across various acoustic metrics in RIR estimation. Additionally it also achieves higher preference scores in human evaluation. As an auxiliary benefit dereverbed speech from AV-RIR shows competitive performance with the state-of-the-art in various spoken language processing tasks and outperforms reverberation time error score in the real-world AVSpeech dataset. Qualitative examples of both synthesized reverberant speech and enhanced speech are available online https://www.youtube.com/watch?v=tTsKhviukAE.

Depth-aware Test-Time Training for Zero-shot Video Object Segmentation
Weihuang Liu, Xi Shen, Haolun Li, Xiuli Bi, Bo Liu, Chi-Man Pun, Xiaodong Cun; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 19218-19227
Zero-shot Video Object Segmentation (ZSVOS) aims at segmenting the primary moving object without any human annotations. Mainstream solutions mainly focus on learning a single model on large-scale video datasets which struggle to generalize to unseen videos. In this work we introduce a test-time training (TTT) strategy to address the problem. Our key insight is to enforce the model to predict consistent depth during the TTT process. In detail we first train a single network to perform both segmentation and depth prediction tasks. This can be effectively learned with our specifically designed depth modulation layer. Then for the TTT process the model is updated by predicting consistent depth maps for the same frame under different data augmentations. In addition we explore different TTT weight update strategies. Our empirical results suggest that the momentum-based weight initialization and looping-based training scheme lead to more stable improvements. Experiments show that the proposed method achieves clear improvements on ZSVOS. Our proposed video TTT strategy provides significant superiority over state-of-the-art TTT methods. Our code is available at: https://nifangbaage.github.io/DATTT/.

Dual-Consistency Model Inversion for Non-Exemplar Class Incremental Learning
Zihuan Qiu, Yi Xu, Fanman Meng, Hongliang Li, Linfeng Xu, Qingbo Wu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 24025-24035
Non-exemplar class incremental learning (NECIL) aims to continuously assimilate new knowledge without forgetting previously acquired ones when historical data are unavailable. One of the generative NECIL methods is to invert the images of old classes for joint training. However these synthetic images suffer significant domain shifts compared with real data hampering the recognition of old classes. In this paper we present a novel method termed Dual-Consistency Model Inversion (DCMI) to generate better synthetic samples of old classes through two pivotal consistency alignments: (1) the semantic consistency between the synthetic images and the corresponding prototypes and (2) domain consistency between synthetic and real images of new classes. Besides we introduce Prototypical Routing (PR) to provide task-prior information and generate unbiased and accurate predictions. Our comprehensive experiments across diverse datasets consistently showcase the superiority of our method over previous state-of-the-art approaches.

RMem: Restricted Memory Banks Improve Video Object Segmentation
Junbao Zhou, Ziqi Pang, Yu-Xiong Wang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 18602-18611
With recent video object segmentation (VOS) benchmarks evolving to challenging scenarios we revisit a simple but overlooked strategy: restricting the size of memory banks. This diverges from the prevalent practice of expanding memory banks to accommodate extensive historical information. Our specially designed "memory deciphering" study offers a pivotal insight underpinning such a strategy: expanding memory banks while seemingly beneficial actually increases the difficulty for VOS modules to decode relevant features due to the confusion from redundant information. By restricting memory banks to a limited number of essential frames w

e achieve a notable improvement in VOS accuracy. This process balances the importance and freshness of frames to maintain an informative memory bank within a bounded capacity. Additionally restricted memory banks reduce the training-inference discrepancy in memory lengths compared with continuous expansion. This fosters new opportunities in temporal reasoning and enables us to introduce the previously overlooked "temporal positional embedding." Finally our insights are embodied in "RMem" ("R" for restricted) a simple yet effective VOS modification that excels at challenging VOS scenarios and establishes new state of the art for object state changes (VOST dataset) and long videos (the Long Videos dataset). Our codes are available at https://github.com/Restricted-Memory/RMemand our demo can be watched on https://youtu.be/V3tCFQsJrrM.

Not All Prompts Are Secure: A Switchable Backdoor Attack Against Pre-trained Vision Transfomers
Sheng Yang, Jiawang Bai, Kuofeng Gao, Yong Yang, Yiming Li, Shu-Tao Xia; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 24431-24441
Given the power of vision transformers a new learning paradigm pre-training and then prompting makes it more efficient and effective to address downstream visual recognition tasks. In this paper we identify a novel security threat towards such a paradigm from the perspective of backdoor attacks. Specifically an extra prompt token called the switch token in this work can turn the backdoor mode on i.e. converting a benign model into a backdoored one. Once under the backdoor mode a specific trigger can force the model to predict a target class. It poses a severe risk to the users of cloud API since the malicious behavior can not be activated and detected under the benign mode thus making the attack very stealthy. To attack a pre-trained model our proposed attack named SWARM learns a trigger and prompt tokens including a switch token. They are optimized with the clean loss which encourages the model always behaves normally even the trigger presents and the backdoor loss that ensures the backdoor can be activated by the trigger when the switch is on. Besides we utilize the cross-mode feature distillation to reduce the effect of the switch token on clean samples. The experiments on diverse visual recognition tasks confirm the success of our switchable backdoor attack i.e. achieving 95%+ attack success rate and also being hard to be detected and removed. Our code is available at https://github.com/20000yshust/SWARM.

PairDETR : Joint Detection and Association of Human Bodies and Faces
Ammar Ali, Georgii Gaikov, Denis Rybalchenko, Alexander Chigorin, Ivan Laptev, Sergey Zagoruyko; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 423-432
Image and video analysis requires not only accurate object but also the understanding of relationships among detected objects. Common solutions to relation modeling typically resort to stand-alone object detectors followed by non-differentiable post-processing techniques. Recently introduced detection transformers (DETR) perform end-to-end object detection based on a bipartite matching loss. Such methods however lack the ability to jointly detect objects and resolve object associations. In this paper we build on the DETR approach and extend it to the joint detection of objects and their relationships by introducing an approximated bipartite matching. While our method can generalize to an arbitrary number of objects we here focus on the modeling of object pairs and their relations. In particular we apply our method PairDETR to the problem of detecting human bodies and faces and associating them for the same person. Our approach not only eliminates the need for hand-designed post-processing but also achieves excellent results for body-face associations. We evaluate PairDETR on the challenging CrowdHuman and CityPersons datasets and demonstrate a large improvement over the state of the art. Our training code and pre-trained models are available online.

PortraitBooth: A Versatile Portrait Model for Fast Identity-preserved Personalization
Xu Peng, Junwei Zhu, Boyuan Jiang, Ying Tai, Donghao Luo, Jiangning Zhang, Wei L

in, Taisong Jin, Chengjie Wang, Rongrong Ji; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 27080-27090
Recent advancements in personalized image generation using diffusion models have been noteworthy. However existing methods suffer from inefficiencies due to the requirement for subject-specific fine-tuning. This computationally intensive process hinders efficient deployment limiting practical usability. Moreover these methods often grapple with identity distortion and limited expression diversity. In light of these challenges we propose PortraitBooth an innovative approach designed for high efficiency robust identity preservation and expression-editable text-to-image generation without the need for fine-tuning. PortraitBooth leverages subject embeddings from a face recognition model for personalized image generation without fine-tuning. It eliminates computational overhead and mitigates identity distortion. The introduced dynamic identity preservation strategy further ensures close resemblance to the original image identity. Moreover PortraitBooth incorporates emotion-aware cross-attention control for diverse facial expressions in generated images supporting text-driven expression editing. Its scalability enables efficient and high-quality image creation including multi-subject generation. Extensive results demonstrate superior performance over other state-of-the-art methods in both single and multiple image generation scenarios.
****
Learn from View Correlation: An Anchor Enhancement Strategy for Multi-view Clustering
Suyuan Liu, Ke Liang, Zhibin Dong, Siwei Wang, Xihong Yang, Sihang Zhou, En Zhu, Xinwang Liu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 26151-26161
In recent years anchor-based methods have achieved promising progress in multi-view clustering. The performances of these methods are significantly affected by the quality of the anchors. However the anchors generated by previous works solely rely on single-view information ignoring the correlation among different views. In particular we observe that similar patterns are more likely to exist between similar views so such correlation information can be leveraged to enhance the quality of the anchors which is also omitted. To this end we propose a novel plug-and-play anchor enhancement strategy through view correlation for multi-view clustering. Specifically we construct a view graph based on aligned initial anchor graphs to explore inter-view correlations. By learning from view correlation we enhance the anchors of the current view using the relationships between anchors and samples on neighboring views thereby narrowing the spatial distribution of anchors on similar views. Experimental results on seven datasets demonstrate the superiority of our proposed method over other existing methods. Furthermore extensive comparative experiments validate the effectiveness of the proposed anchor enhancement module when applied to various anchor-based methods.

SportsSloMo: A New Benchmark and Baselines for Human-centric Video Frame Interpolation
Jiaben Chen, Huaizu Jiang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 6475-6486
Human-centric video frame interpolation has great potential for enhancing entertainment experiences and finding commercial applications in sports analysis industry e.g. synthesizing slow-motion videos. Although there are multiple benchmark datasets available for video frame interpolation in the community none of them is dedicated to human-centric scenarios. To bridge this gap we introduce SportsSloMo a benchmark featuring over 130K high-resolution slow-motion sports video clips totaling over 1M video frames sourced from YouTube. We re-train several state-of-the-art methods on our benchmark and we observed a noticeable decrease in their accuracy compared to other datasets. This highlights the difficulty of our benchmark and suggests that it poses significant challenges even for the best-performing methods as human bodies are highly deformable and occlusions are frequent in sports videos. To tackle these challenges we propose human-aware loss terms where we add auxiliary supervision for human segmentation in panoptic settings and keypoints detection. These loss terms are model-agnostic and can be easily p

lugged into any video frame interpolation approach. Experimental results validat
e the effectiveness of our proposed human-aware loss terms leading to consistent
 performance improvement over existing models. The dataset and code can be found
 at: https://neu-vi.github.io/SportsSlomo/ https://neu-vi.github.io/SportsSlomo
/.

APSeg: Auto-Prompt Network for Cross-Domain Few-Shot Semantic Segmentation
Weizhao He, Yang Zhang, Wei Zhuo, Linlin Shen, Jiaqi Yang, Songhe Deng, Liang Su
n; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recogni
tion (CVPR), 2024, pp. 23762-23772
Few-shot semantic segmentation (FSS) endeavors to segment unseen classes with on
ly a few labeled samples. Current FSS methods are commonly built on the assumpti
on that their training and application scenarios share similar domains and their
 performances degrade significantly while applied to a distinct domain. To this
end we propose to leverage the cutting-edge foundation model the Segment Anythin
g Model (SAM) for generalization enhancement. The SAM however performs unsatisfa
ctorily on domains that are distinct from its training data which primarily comp
rise natural scene images and it does not support automatic segmentation of spec
ific semantics due to its interactive prompting mechanism. In our work we introd
uce APSeg a novel auto-prompt network for cross-domain few-shot semantic segment
ation (CD-FSS) which is designed to be auto-prompted for guiding cross-domain se
gmentation. Specifically we propose a Dual Prototype Anchor Transformation (DPAT
) module that fuses pseudo query prototypes extracted based on cycle-consistency
 with support prototypes allowing features to be transformed into a more stable
domain-agnostic space. Additionally a Meta Prompt (MPG) module is introduced to
automatically generate prompt embeddings eliminating the need for manual visual
prompts. We build an efficient model which can be applied directly to target dom
ains without fine-tuning. Extensive experiments on four cross-domain datasets sh
ow that our model outperforms the state-of-the-art CD-FSS method by 5.24% and 3.
10% in average accuracy on 1-shot and 5-shot settings respectively.
****
Text2HOI: Text-guided 3D Motion Generation for Hand-Object Interaction
Junuk Cha, Jihyeon Kim, Jae Shin Yoon, Seungryul Baek; Proceedings of the IEEE/C
VF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 1577-
1585
This paper introduces the first text-guided work for generating the sequence of
hand-object interaction in 3D. The main challenge arises from the lack of labele
d data where existing ground-truth datasets are nowhere near generalizable in in
teraction type and object category which inhibits the modeling of diverse 3D han
d-object interaction with the correct physical implication (e.g. contacts and se
mantics) from text prompts. To address this challenge we propose to decompose th
e interaction generation task into two subtasks: hand-object contact generation;
 and hand-object motion generation. For contact generation a VAE-based network t
akes as input a text and an object mesh and generates the probability of contact
s between the surfaces of hands and the object during the interaction. The netwo
rk learns a variety of local geometry structure of diverse objects that is indep
endent of the objects' category and thus it is applicable to general objects. Fo
r motion generation a Transformer-based diffusion model utilizes this 3D contact
 map as a strong prior for generating physically plausible hand-object motion as
 a function of text prompts by learning from the augmented labeled dataset; wher
e we annotate text labels from many existing 3D hand and object motion data. Fin
ally we further introduce a hand refiner module that minimizes the distance betw
een the object surface and hand joints to improve the temporal stability of the
object-hand contacts and to suppress the penetration artifacts. In the experimen
ts we demonstrate that our method can generate more realistic and diverse intera
ctions compared to other baseline methods. We also show that our method is appli
cable to unseen objects. We will release our model and newly labeled data as a s
trong foundation for future research. Codes and data are available in: https://g
ithub.com/JunukCha/Text2HOI.

Zero-TPrune: Zero-Shot Token Pruning through Leveraging of the Attention Graph i
n Pre-Trained Transformers
Hongjie Wang, Bhishma Dedhia, Niraj K. Jha; Proceedings of the IEEE/CVF Conferen
ce on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 16070-16079
Deployment of Transformer models on edge devices is becoming increasingly challe
nging due to the exponentially growing inference cost that scales quadratically
with the number of tokens in the input sequence. Token pruning is an emerging so
lution to address this challenge due to its ease of deployment on various Transf
ormer backbones. However most token pruning methods require computationally expe
nsive fine-tuning which is undesirable in many edge deployment cases. In this wo
rk we propose Zero-TPrune the first zero-shot method that considers both the imp
ortance and similarity of tokens in performing token pruning. It leverages the a
ttention graph of pre-trained Transformer models to produce an importance distri
bution for tokens via our proposed Weighted Page Rank (WPR) algorithm. This dist
ribution further guides token partitioning for efficient similarity-based prunin
g. Due to the elimination of the fine-tuning overhead Zero-TPrune can prune larg
e models at negligible computational cost switch between different pruning confi
gurations at no computational cost and perform hyperparameter tuning efficiently
. We evaluate the performance of Zero-TPrune on vision tasks by applying it to v
arious vision Transformer backbones and testing them on ImageNet. Without any fi
ne-tuning Zero-TPrune reduces the FLOPs cost of DeiT-S by 34.7% and improves its
 throughput by 45.3% with only 0.4% accuracy loss. Compared with state-of-the-ar
t pruning methods that require fine-tuning Zero-TPrune not only eliminates the n
eed for fine-tuning after pruning but also does so with only 0.1% accuracy loss.
 Compared with state-of-the-art fine-tuning-free pruning methods Zero-TPrune red
uces accuracy loss by up to 49% with the same or higher throughput.

Enhancing Visual Continual Learning with Language-Guided Supervision
Bolin Ni, Hongbo Zhao, Chenghao Zhang, Ke Hu, Gaofeng Meng, Zhaoxiang Zhang, Shi
ming Xiang; Proceedings of the IEEE/CVF Conference on Computer Vision and Patter
n Recognition (CVPR), 2024, pp. 24068-24077
Continual learning (CL) aims to empower models to learn new tasks without forget
ting previously acquired knowledge. Most prior works concentrate on the techniqu
es of architectures replay data regularization etc. However the category name of
 each class is largely neglected. Existing methods commonly utilize the one-hot
labels and randomly initialize the classifier head. We argue that the scarce sem
antic information conveyed by the one-hot labels hampers the effective knowledge
 transfer across tasks. In this paper we revisit the role of the classifier head
 within the CL paradigm and replace the classifier with semantic knowledge from
pretrained language models (PLMs). Specifically we use PLMs to generate semantic
 targets for each class which are frozen and serve as supervision signals during
 training. Such targets fully consider the semantic correlation between all clas
ses across tasks. Empirical studies show that our approach mitigates forgetting
by alleviating representation drifting and facilitating knowledge transfer acros
s tasks. The proposed method is simple to implement and can seamlessly be plugge
d into existing methods with negligible adjustments. Extensive experiments based
 on eleven mainstream baselines demonstrate the effectiveness and generalizabili
ty of our approach to various protocols. For example under the class-incremental
 learning setting on ImageNet-100 our method significantly improves the Top-1 ac
curacy by 3.2% to 6.1% while reducing the forgetting rate by 2.6% to 13.1%.

MACE: Mass Concept Erasure in Diffusion Models
Shilin Lu, Zilan Wang, Leyang Li, Yanzhu Liu, Adams Wai-Kin Kong; Proceedings of
 the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024
, pp. 6430-6440
The rapid expansion of large-scale text-to-image diffusion models has raised gro
wing concerns regarding their potential misuse in creating harmful or misleading
 content. In this paper we introduce MACE a finetuning framework for the task of
 mass concept erasure. This task aims to prevent models from generating images t
hat embody unwanted concepts when prompted. Existing concept erasure methods are

typically restricted to handling fewer than five concepts simultaneously and st ruggle to find a balance between erasing concept synonyms (generality) and maint aining unrelated concepts (specificity). In contrast MACE differs by successfull y scaling the erasure scope up to 100 concepts and by achieving an effective bal ance between generality and specificity. This is achieved by leveraging closed-f orm cross-attention refinement along with LoRA finetuning collectively eliminati ng the information of undesirable concepts. Furthermore MACE integrates multiple LoRAs without mutual interference. We conduct extensive evaluations of MACE aga inst prior methods across four different tasks: object erasure celebrity erasure explicit content erasure and artistic style erasure. Our results reveal that MA CE surpasses prior methods in all evaluated tasks. Code is available at https:// github.com/Shilin-LU/MACE.

DIBS: Enhancing Dense Video Captioning with Unlabeled Videos via Pseudo Boundary Enrichment and Online Refinement
Hao Wu, Huabin Liu, Yu Qiao, Xiao Sun; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 18699-18708
We present Dive Into the Boundaries (DIBS) a novel pretraining framework for den se video captioning (DVC) that elaborates on improving the quality of the genera ted event captions and their associated pseudo event boundaries from unlabeled v ideos. By leveraging the capabilities of diverse large language models (LLMs) we generate rich DVC-oriented caption candidates and optimize the corresponding ps eudo boundaries under several meticulously designed objectives considering diver sity event-centricity temporal ordering and coherence. Moreover we further intro duce a novel online boundary refinement strategy that iteratively improves the q uality of pseudo boundaries during training. Comprehensive experiments have been conducted to examine the effectiveness of the proposed technique components. By leveraging a substantial amount of unlabeled video data such as HowTo100M we ac hieve a remarkable advancement on standard DVC datasets like YouCook2 and Activi tyNet. We outperform the previous state-of-the-art Vid2Seq across a majority of metrics achieving this with just 0.4% of the unlabeled video data used for pre-t raining by Vid2Seq.
****
PeLK: Parameter-efficient Large Kernel ConvNets with Peripheral Convolution
Honghao Chen, Xiangxiang Chu, Yongjian Ren, Xin Zhao, Kaiqi Huang; Proceedings o f the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 202 4, pp. 5557-5567
Recently some large kernel convnets strike back with appealing performance and e fficiency. However given the square complexity of convolution scaling up kernels can bring about an enormous amount of parameters and the proliferated parameter s can induce severe optimization problem. Due to these issues current CNNs compr omise to scale up to 51x51 in the form of stripe convolution (i.e. 51x5+5x51) an d start to saturate as the kernel size continues growing. In this paper we delve into addressing these vital issues and explore whether we can continue scaling up kernels for more performance gains. Inspired by human vision we propose a hum an-like peripheral convolution that efficiently reduces over 90% parameter count of dense grid convolution through parameter sharing and manage to scale up kern el size to extremely large. Our peripheral convolution behaves highly similar to human reducing the complexity of convolution from O(K^2) to O(logK) without bac kfiring performance. Built on this we propose Parameter-efficient Large Kernel N etwork (PeLK). Our PeLK outperforms modern vision Transformers and ConvNet archi tectures like Swin ConvNeXt RepLKNet and SLaK on various vision tasks including ImageNet classification semantic segmentation on ADE20K and object detection on MS COCO. For the first time we successfully scale up the kernel size of CNNs to an unprecedented 101x101 and demonstrate consistent improvements.

AiOS: All-in-One-Stage Expressive Human Pose and Shape Estimation
Qingping Sun, Yanjun Wang, Ailing Zeng, Wanqi Yin, Chen Wei, Wenjia Wang, Haiyi Mei, Chi-Sing Leung, Ziwei Liu, Lei Yang, Zhongang Cai; Proceedings of the IEEE/ CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 1834

-1843
Expressive human pose and shape estimation (a.k.a. 3D whole-body mesh recovery) involves the human body hand and expression estimation. Most existing methods have tackled this task in a two-stage manner first detecting the human body part with an off-the-shelf detection model and then inferring the different human body parts individually. Despite the impressive results achieved these methods suffer from 1) loss of valuable contextual information via cropping 2) introducing distractions and 3) lacking inter-association among different persons and body parts inevitably causing performance degradation especially for crowded scenes. To address these issues we introduce a novel all-in-one-stage framework AiOS for multiple expressive human pose and shape recovery without an additional human detection step. Specifically our method is built upon DETR which treats multi-person whole-body mesh recovery task as a progressive set prediction problem with various sequential detection. We devise the decoder tokens and extend them to our task. Specifically we first employ a human token to probe a human location in the image and encode global features for each instance which provides a coarse location for the later transformer block. Then we introduce a joint-related token to probe the human joint in the image and encoder a fine-grained local feature which collaborates with the global feature to regress the whole-body mesh. This straightforward but effective model outperforms previous state-of-the-art methods by a 9 reduction in NMVE on AGORA a 30 reduction in PVE on EHF a 10 reduction in PVE on ARCTIC and a 3 reduction in PVE on EgoBody.

SOK-Bench: A Situated Video Reasoning Benchmark with Aligned Open-World Knowledge
Andong Wang, Bo Wu, Sunli Chen, Zhenfang Chen, Haotian Guan, Wei-Ning Lee, Li Erran Li, Chuang Gan; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 13384-13394
Reasoning from visual dynamics scenes has many real world applications. However existing video reasoning benchmarks are still inadequate since they were mainly designed for factual or situated reasoning and rarely involve broader knowledge in the real world. Our work aims to delve deeper into reasoning evaluations specifically within dynamic open-world and structured context knowledge. We propose a new benchmark (SOK-Bench) consisting of 44K questions and 10K situations with instance-level annotations depicted in the videos. The reasoning process is required to understand and apply situated knowledge and general knowledge for problem-solving. To create such a dataset we propose an automatic and scalable generation method to generate question-answer pairs knowledge graphs and rationales by instructing the combinations of LLMs and MLLMs. Concretely we first extract observable situated entities relations and processes from videos for situated knowledge and then extend to open-world knowledge beyond the visible content. The task generation is facilitated through multiple dialogues as iterations and subsequently corrected and refined by our designed self-promptings and demonstrations. With a corpus of both explicit situated facts and implicit commonsense we generate associated question-answer pairs and reasoning processes finally followed by manual reviews for quality assurance. We evaluated recent mainstream large vision language models on the benchmark and found several insightful conclusions. For more information please refer to our benchmark at www.bobbywu.com/SOKBench.
****
LORS: Low-rank Residual Structure for Parameter-Efficient Network Stacking
Jialin Li, Qiang Nie, Weifu Fu, Yuhuan Lin, Guangpin Tao, Yong Liu, Chengjie Wang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 15866-15876
Deep learning models particularly those based on transformers often employ numerous stacked structures which possess identical architectures and perform similar functions. While effective this stacking paradigm leads to a substantial increase in the number of parameters pos- ing challenges for practical applications. In today's land- scape of increasingly large models stacking depth can even reach dozens further exacerbating this issue. To miti- gate this problem we introduce LORS (LOw-rank Residual Structure). LORS allows stacked modules to share the ma

jority of parameters requiring a much smaller num- ber of unique ones per module to match or even surpass the performance of using entirely distinct ones thereby significantly reducing parameter usage. We validate our method by applying it to the stacked decoders of a query- based object detector and conduct extensive experiments on the widely used MS COCO dataset. Experimental re- sults demonstrate the effectiveness of our method as even with a 70% reduction in the parameters of the decoder our method still enables the model to achieve comparable or even better performance than its original.
****
Design2Cloth: 3D Cloth Generation from 2D Masks
Jiali Zheng, Rolandos Alexandros Potamias, Stefanos Zafeiriou; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 1748-1758
In recent years there has been a significant shift in the field of digital avatar research towards modeling animating and reconstructing clothed human representations as a key step towards creating realistic avatars. However current 3D cloth generation methods are garment specific or trained completely on synthetic data hence lacking fine details and realism. In this work we make a step towards automatic realistic garment design and propose Design2Cloth a high fidelity 3D generative model trained on a real world dataset from more than 2000 subject scans. To provide vital contribution to the fashion industry we developed a user-friendly adversarial model capable of generating diverse and detailed clothes simply by drawing a 2D cloth mask. Under a series of both qualitative and quantitative experiments we showcase that Design2Cloth outperforms current state-of-the-art cloth generative models by a large margin. In addition to the generative properties of our network we showcase that the proposed method can be used to achieve high quality reconstructions from single in-the-wild images and 3D scans. Dataset code and pre-trained model will become publicly available.

Multi-modal In-Context Learning Makes an Ego-evolving Scene Text Recognizer
Zhen Zhao, Jingqun Tang, Chunhui Lin, Binghong Wu, Can Huang, Hao Liu, Xin Tan, Zhizhong Zhang, Yuan Xie; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 15567-15576
Scene text recognition (STR) in the wild frequently encounters challenges when coping with domain variations font diversity shape deformations etc. A straightforward solution is performing model fine-tuning tailored to a specific scenario but it is computationally intensive and requires multiple model copies for various scenarios. Recent studies indicate that large language models (LLMs) can learn from a few demonstration examples in a training-free manner termed "In-Context Learning" (ICL). Nevertheless applying LLMs as a text recognizer is unacceptably resource-consuming. Moreover our pilot experiments on LLMs show that ICL fails in STR mainly attributed to the insufficient incorporation of contextual information from diverse samples in the training stage. To this end we introduce E2STR a STR model trained with context-rich scene text sequences where the sequences are generated via our proposed in-context training strategy. E2STR demonstrates that a regular-sized model is sufficient to achieve effective ICL capabilities in STR. Extensive experiments show that E2STR exhibits remarkable training-free adaptation in various scenarios and outperforms even the fine-tuned state-of-the-art approaches on public benchmarks. The code is released at https://github.com/bytedance/E2STR.
****
Amodal Completion via Progressive Mixed Context Diffusion
Katherine Xu, Lingzhi Zhang, Jianbo Shi; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 9099-9109
Our brain can effortlessly recognize objects even when partially hidden from view. Seeing the visible of the hidden is called amodal completion; however this task remains a challenge for generative AI despite rapid progress. We propose to sidestep many of the difficulties of existing approaches which typically involve a two-step process of predicting amodal masks and then generating pixels. Our method involves thinking outside the box literally! We go outside the object bound

ing box to use its context to guide a pre-trained diffusion inpainting model and then progressively grow the occluded object and trim the extra background. We overcome two technical challenges: 1) how to be free of unwanted co-occurrence bias which tends to regenerate similar occluders and 2) how to judge if an amodal completion has succeeded. Our amodal completion method exhibits improved photorealistic completion results compared to existing approaches in numerous successful completion cases. And the best part? It doesn't require any special training or fine-tuning of models. Project page and code: https://k8xu.github.io/amodal/

Training Diffusion Models Towards Diverse Image Generation with Reinforcement Learning
Zichen Miao, Jiang Wang, Ze Wang, Zhengyuan Yang, Lijuan Wang, Qiang Qiu, Zicheng Liu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 10844-10853
Diffusion models have demonstrated unprecedented capabilities in image generation. Yet they incorporate and amplify the data bias (e.g. gender age) from the original training set limiting the diversity of generated images. In this paper we propose a diversity-oriented fine-tuning method using reinforcement learning (RL) for diffusion models under the guidance of an image-set-based reward function. Specifically the proposed reward function denoted as Diversity Reward utilizes a set of generated images to evaluate the coverage of the current generative distribution w.r.t. the reference distribution represented by a set of unbiased images. Built on top of the probabilistic method of distribution discrepancy estimation Diversity Reward can measure the relative distribution gap with a small set of images efficiently. We further formulate the diffusion process as a multi-step decision-making problem (MDP) and apply policy gradient methods to fine-tune diffusion models by maximizing the Diversity Reward. The proposed rewards are validated on a post-sampling selection task where a subset of the most diverse images are selected based on Diversity Reward values. We also show the effectiveness of our RL fine-tuning framework on enhancing the diversity of image generation with different types of diffusion models including class-conditional models and text-conditional models e.g. StableDiffusion.

Diffusion 3D Features (Diff3F): Decorating Untextured Shapes with Distilled Semantic Features
Niladri Shekhar Dutt, Sanjeev Muralikrishnan, Niloy J. Mitra; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 4494-4504
We present Diff3F as a simple robust and class-agnostic feature descriptor that can be computed for untextured input shapes (meshes or point clouds). Our method distills diffusion features from image foundational models onto input shapes. Specifically we use the input shapes to produce depth and normal maps as guidance for conditional image synthesis. In the process we produce (diffusion) features in 2D that we subsequently lift and aggregate on the original surface. Our key observation is that even if the conditional image generations obtained from multi-view rendering of the input shapes are inconsistent the associated image features are robust and hence can be directly aggregated across views. This produces semantic features on the input shapes without requiring additional data or training. We perform extensive experiments on multiple benchmarks (SHREC'19 SHREC'20 FAUST and TOSCA) and demonstrate that our features being semantic instead of geometric produce reliable correspondence across both isometric and non-isometrically related shape families. Code is available via the project webpage at https://diff3f.github.io/

LASIL: Learner-Aware Supervised Imitation Learning For Long-term Microscopic Traffic Simulation
Ke Guo, Zhenwei Miao, Wei Jing, Weiwei Liu, Weizi Li, Dayang Hao, Jia Pan; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 15386-15395
Microscopic traffic simulation plays a crucial role in transportation engineerin

g by providing insights into individual vehicle behavior and overall traffic flo
w. However creating a realistic simulator that accurately replicates human drivi
ng behaviors in various traffic conditions presents significant challenges. Trad
itional simulators relying on heuristic models often fail to deliver accurate si
mulations due to the complexity of real-world traffic environments. Due to the c
ovariate shift issue existing imitation learning-based simulators often fail to
generate stable long-term simulations. In this paper we propose a novel approach
 called learner-aware supervised imitation learning to address the covariate shi
ft problem in multi-agent imitation learning. By leveraging a variational autoen
coder simultaneously modeling the expert and learner state distribution our appr
oach augments expert states such that the augmented state is aware of learner st
ate distribution. Our method applied to urban traffic simulation demonstrates si
gnificant improvements over existing state-of-the-art baselines in both short-te
rm microscopic and long-term macroscopic realism when evaluated on the real-worl
d dataset pNEUMA.

Revamping Federated Learning Security from a Defender's Perspective: A Unified D
efense with Homomorphic Encrypted Data Space
K Naveen Kumar, Reshmi Mitra, C Krishna Mohan; Proceedings of the IEEE/CVF Confe
rence on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 24387-24397
Federated Learning (FL) facilitates clients to collaborate on training a shared
machine learning model without exposing individual private data. Nonetheless FL
remains susceptible to utility and privacy attacks notably evasion data poisonin
g and model inversion attacks compromising the system's efficiency and data priv
acy. Existing FL defenses are often specialized to a particular single attack la
cking generality and a comprehensive defender's perspective. To address these ch
allenges we introduce Federated Cryptography Defense (FCD) a unified single fram
ework aligning with the defender's perspective. FCD employs row-wise transpositi
on cipher based data encryption with a secret key to counter both evasion black-
box data poisoning and model inversion attacks. The crux of FCD lies in transfer
ring the entire learning process into an encrypted data space and using a novel
distillation loss guided by the Kullback-Leibler (KL) divergence. This measure c
ompares the probability distributions of the local pretrained teacher model's pr
edictions on normal data and the local student model's predictions on the same d
ata in FCD's encrypted form. By working within this encrypted space FCD eliminat
es the need for decryption at the server resulting in reduced computational comp
lexity. We demonstrate the practical feasibility of FCD and apply it to defend a
gainst evasion utility attack on benchmark datasets (GTSRB KBTS CIFAR10 and EMNI
ST). We further extend FCD for defending against model inversion attack in split
 FL on the CIFAR100 dataset. Our experiments across the diverse attack and FL se
ttings demonstrate practical feasibility and robustness against utility evasion
(impact >30) and privacy attacks (MSE >73) compared to the second best method.

A Dynamic Kernel Prior Model for Unsupervised Blind Image Super-Resolution
Zhixiong Yang, Jingyuan Xia, Shengxi Li, Xinghua Huang, Shuanghui Zhang, Zhen Li
u, Yaowen Fu, Yongxiang Liu; Proceedings of the IEEE/CVF Conference on Computer
Vision and Pattern Recognition (CVPR), 2024, pp. 26046-26056
Deep learning-based methods have achieved significant successes on solving the b
lind super-resolution (BSR) problem. However most of them request supervised pre
-training on labelled datasets. This paper proposes an unsupervised kernel estim
ation model named dynamic kernel prior (DKP) to realize an unsupervised and pre-
training-free learning-based algorithm for solving the BSR problem. DKP can adap
tively learn dynamic kernel priors to realize real-time kernel estimation and th
ereby enables superior HR image restoration performances. This is achieved by a
Markov chain Monte Carlo sampling process on random kernel distributions. The le
arned kernel prior is then assigned to optimize a blur kernel estimation network
 which entails a network-based Langevin dynamic optimization strategy. These two
 techniques ensure the accuracy of the kernel estimation. DKP can be easily used
 to replace the kernel estimation models in the existing methods such as Double-
DIP and FKP-DIP or be added to the off-the-shelf image restoration model such as

diffusion model. In this paper we incorporate our DKP model with DIP and diffusion model referring to DIP-DKP and Diff-DKP for validations. Extensive simulations on Gaussian and motion kernel scenarios demonstrate that the proposed DKP model can significantly improve the kernel estimation with comparable runtime and memory usage leading to state-of-the-art BSR results. The code is available at https://github.com/XYLGroup/DKP.
****
Cinematic Behavior Transfer via NeRF-based Differentiable Filming
Xuekun Jiang, Anyi Rao, Jingbo Wang, Dahua Lin, Bo Dai; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 6723-6732
In the evolving landscape of digital media and video production the precise manipulation and reproduction of visual elements like camera movements and character actions are highly desired. Existing SLAM methods face limitations in dynamic scenes and human pose estimation often focuses on 2D projections neglecting 3D statuses. To address these issues we first introduce a reverse filming behavior estimation technique. It optimizes camera trajectories by leveraging NeRF as a differentiable renderer and refining SMPL tracks. We then introduce a cinematic transfer pipeline that is able to transfer various shot types to a new 2D video or a 3D virtual environment. The incorporation of 3D engine workflow enables superior rendering and control abilities which also achieves a higher rating in the user study.
****
SeaBird: Segmentation in Bird's View with Dice Loss Improves Monocular 3D Detection of Large Objects
Abhinav Kumar, Yuliang Guo, Xinyu Huang, Liu Ren, Xiaoming Liu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 10269-10280
Monocular 3D detectors achieve remarkable performance on cars and smaller objects. However their performance drops on larger objects leading to fatal accidents. Some attribute the failures to training data scarcity or the receptive field requirements of large objects. In this paper we highlight this understudied problem of generalization to large objects. We find that modern frontal detectors struggle to generalize to large objects even on nearly balanced datasets. We argue that the cause of failure is the sensitivity of depth regression losses to noise of larger objects. To bridge this gap we comprehensively investigate regression and dice losses examining their robustness under varying error levels and object sizes. We mathematically prove that the dice loss leads to superior noise-robustness and model convergence for large objects compared to regression losses for a simplified case. Leveraging our theoretical insights we propose SeaBird (Segmentation in Bird's View) as the first step towards generalizing to large objects. SeaBird effectively integrates BEV segmentation on foreground objects for 3D detection with the segmentation head trained with the dice loss. SeaBird achieves SoTA results on the KITTI-360 leaderboard and improves existing detectors on the nuScenes leaderboard particularly for large objects.

Text-Driven Image Editing via Learnable Regions
Yuanze Lin, Yi-Wen Chen, Yi-Hsuan Tsai, Lu Jiang, Ming-Hsuan Yang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 7059-7068
Language has emerged as a natural interface for image editing. In this paper we introduce a method for region-based image editing driven by textual prompts without the need for user-provided masks or sketches. Specifically our approach leverages an existing pre-trained text-to-image model and introduces a bounding box generator to identify the editing regions that are aligned with the textual prompts. We show that this simple approach enables flexible editing that is compatible with current image generation models and is able to handle complex prompts featuring multiple objects complex sentences or lengthy paragraphs. We conduct an extensive user study to compare our method against state-of-the-art methods. The experiments demonstrate the competitive performance of our method in manipulati

ng images with high fidelity and realism that correspond to the provided languag
e descriptions. Our project webpage can be found at: https://yuanzelin.me/Learna
bleRegions_page.

Relation Rectification in Diffusion Model
Yinwei Wu, Xingyi Yang, Xinchao Wang; Proceedings of the IEEE/CVF Conference on
Computer Vision and Pattern Recognition (CVPR), 2024, pp. 7685-7694
Despite their exceptional generative abilities large T2I diffusion models much l
ike skilled but careless artists often struggle with accurately depicting visual
 relationships between objects. This issue as we uncover through careful analysi
s arises from a misaligned text encoder that struggles to interpret specific rel
ationships and differentiate the logical order of associated objects. To resolve
 this we introduce a novel task termed Relation Rectification aiming to refine t
he model to accurately represent a given relationship it initially fails to gene
rate. To address this we propose an innovative solution utilizing a Heterogeneou
s Graph Convolutional Network (HGCN). It models the directional relationships be
tween relation terms and corresponding objects within the input prompts. Specifi
cally we optimize the HGCN on a pair of prompts with identical relational words
but reversed object orders supplemented by a few reference images. The lightweig
ht HGCN adjusts the text embeddings generated by the text encoder ensuring accur
ate reflection of the textual relation in the embedding space. Crucially our met
hod retains the parameters of the text encoder and diffusion model preserving th
e model's robust performance on unrelated descriptions. We validated our approac
h on a newly curated dataset of diverse relational data demonstrating both quant
itative and qualitative enhancements in generating images with precise visual re
lations. Project page: https://wuyinwei-hah.github.io/rrnet.github.io/ .

NOPE: Novel Object Pose Estimation from a Single Image
Van Nguyen Nguyen, Thibault Groueix, Georgy Ponimatkin, Yinlin Hu, Renaud Marlet
, Mathieu Salzmann, Vincent Lepetit; Proceedings of the IEEE/CVF Conference on C
omputer Vision and Pattern Recognition (CVPR), 2024, pp. 17923-17932
The practicality of 3D object pose estimation remains limited for many applicati
ons due to the need for prior knowledge of a 3D model and a training period for
new objects. To address this limitation we propose an approach that takes a sing
le image of a new object as input and predicts the relative pose of this object
in new images without prior knowledge of the object's 3D model and without requi
ring training time for new objects and categories. We achieve this by training a
 model to directly predict discriminative embeddings for viewpoints surrounding
the object. This prediction is done using a simple U-Net architecture with atten
tion and conditioned on the desired pose which yields extremely fast inference.
We compare our approach to state-of-the-art methods and show it outperforms them
 both in terms of accuracy and robustness.

Mocap Everyone Everywhere: Lightweight Motion Capture With Smartwatches and a He
ad-Mounted Camera
Jiye Lee, Hanbyul Joo; Proceedings of the IEEE/CVF Conference on Computer Vision
 and Pattern Recognition (CVPR), 2024, pp. 1091-1100
We present a lightweight and affordable motion capture method based on two smart
watches and a head-mounted camera. In contrast to the existing approaches that u
se six or more expert-level IMU devices our approach is much more cost-effective
 and convenient. Our method can make wearable motion capture accessible to every
one everywhere enabling 3D full-body motion capture in diverse environments. As
a key idea to overcome the extreme sparsity and ambiguities of sensor inputs wit
h different modalities we integrate 6D head poses obtained from the head-mounted
 cameras for motion estimation. To enable capture in expansive indoor and outdoo
r scenes we propose an algorithm to track and update floor level changes to defi
ne head poses coupled with a multi-stage Transformer-based regression module. We
 also introduce novel strategies leveraging visual cues of egocentric images to
further enhance the motion capture quality while reducing ambiguities. We demons
trate the performance of our method on various challenging scenarios including c

omplex outdoor environments and everyday motions including object interactions a
nd social interactions among multiple individuals.

Fast ODE-based Sampling for Diffusion Models in Around 5 Steps
Zhenyu Zhou, Defang Chen, Can Wang, Chun Chen; Proceedings of the IEEE/CVF Confe
rence on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 7777-7786
Sampling from diffusion models can be treated as solving the corresponding ordin
ary differential equations (ODEs) with the aim of obtaining an accurate solution
 with as few number of function evaluations (NFE) as possible. Recently various
fast samplers utilizing higher-order ODE solvers have emerged and achieved bette
r performance than the initial first-order one. However these numerical methods
inherently result in certain approximation errors which significantly degrades s
ample quality with extremely small NFE (e.g. around 5). In contrast based on the
 geometric observation that each sampling trajectory almost lies in a two-dimens
ional subspace embedded in the ambient space we propose Approximate MEan-Directi
on Solver (AMED-Solver) that eliminates truncation errors by directly learning t
he mean direction for fast diffusion sampling. Besides our method can be easily
used as a plugin to further improve existing ODE-based samplers. Extensive exper
iments on image synthesis with the resolution ranging from 32 to 512 demonstrate
 the effectiveness of our method. With only 5 NFE we achieve 6.61 FID on CIFAR-1
0 10.74 FID on ImageNet 64x64 and 13.20 FID on LSUN Bedroom. Our code is availab
le at https://github.com/zju-pi/diff-sampler.

Dual-View Visual Contextualization for Web Navigation
Jihyung Kil, Chan Hee Song, Boyuan Zheng, Xiang Deng, Yu Su, Wei-Lun Chao; Proce
edings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CV
PR), 2024, pp. 14445-14454
Automatic web navigation aims to build a web agent that can follow language inst
ructions to execute complex and diverse tasks on real-world websites. Existing w
ork primarily takes HTML documents as input which define the contents and action
 spaces (i.e. actionable elements and operations) of webpages. Nevertheless HTML
 documents may not provide a clear task-related context for each element making
it hard to select the right (sequence of) actions. In this paper we propose to c
ontextualize HTML elements through their "dual views" in webpage screenshots: ea
ch HTML element has its corresponding bounding box and visual content in the scr
eenshot. We build upon the insight---web developers tend to arrange task-related
 elements nearby on webpages to enhance user experiences---and propose to contex
tualize each element with its neighbor elements using both textual and visual fe
atures. The resulting representations of HTML elements are more informative for
the agent to take action. We validate our method on the recently released Mind2W
eb dataset which features diverse navigation domains and tasks on real-world web
sites. Our method consistently outperforms the baseline in all the scenarios inc
luding cross-task cross-website and cross-domain ones.

Language-driven Grasp Detection
An Dinh Vuong, Minh Nhat Vu, Baoru Huang, Nghia Nguyen, Hieu Le, Thieu Vo, Anh N
guyen; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Rec
ognition (CVPR), 2024, pp. 17902-17912
Grasp detection is a persistent and intricate challenge with various industrial
applications. Recently many methods and datasets have been proposed to tackle th
e grasp detection problem. However most of them do not consider using natural la
nguage as a condition to detect the grasp poses. In this paper we introduce Gras
p-Anything++ a new language-driven grasp detection dataset featuring 1M samples
over 3M objects and upwards of 10M grasping instructions. We utilize foundation
models to create a large-scale scene corpus with corresponding images and grasp
prompts. We approach the language-driven grasp detection task as a conditional g
eneration problem. Drawing on the success of diffusion models in generative task
s and given that language plays a vital role in this task we propose a new langu
age-driven grasp detection method based on diffusion models. Our key contributio
n is the contrastive training objective which explicitly contributes to the deno

ising process to detect the grasp pose given the language instructions. We illus trate that our approach is theoretically supportive. The intensive experiments s how that our method outperforms state-of-the-art approaches and allows real-worl d robotic grasping. Finally we demonstrate our large-scale dataset enables zero-short grasp detection and is a challenging benchmark for future work.
****

Towards Modern Image Manipulation Localization: A Large-Scale Dataset and Novel Methods
Chenfan Qu, Yiwu Zhong, Chongyu Liu, Guitao Xu, Dezhi Peng, Fengjun Guo, Lianwen Jin; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Reco gnition (CVPR), 2024, pp. 10781-10790
In recent years image manipulation localization has attracted increasing attenti on due to its pivotal role in ensuring social media security. However effectivel y identifying forged regions remains an open challenge. The high acquisition cos t and the severe scarcity of high-quality data are major factors hindering the p erformance improvement of modern image manipulation localization systems. To add ress this issue we propose a novel paradigm termed as CAAA to automatically and accurately annotate the manually forged images from the web at the pixel-level. We further propose a novel metric termed as QES to assist in filtering out unrel iable annotations. With CAAA and QES we construct a large-scale diverse and high -quality dataset comprising 123150 manually forged images with mask annotations. Furthermore we develop a new model termed as APSC-Net for accurate image manipu lation localization. According to extensive experiments our methods outperforms previous state-of-the-art methods our dataset significantly improves the perform ance of various models on the widely-used benchmarks. The dataset and codes are publicly available at https://github.com/qcf-568/MIML.

Mitigating Noisy Correspondence by Geometrical Structure Consistency Learning
Zihua Zhao, Mengxi Chen, Tianjie Dai, Jiangchao Yao, Bo Han, Ya Zhang, Yanfeng W ang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recog nition (CVPR), 2024, pp. 27381-27390
Noisy correspondence that refers to mismatches in cross-modal data pairs is prev alent on human-annotated or web-crawled datasets. Prior approaches to leverage s uch data mainly consider the application of uni-modal noisy label learning witho ut amending the impact on both cross-modal and intra-modal geometrical structure s in multimodal learning. Actually we find that both structures are effective to discriminate noisy correspondence through structural differences when being wel l-established. Inspired by this observation we introduce a Geometrical Structure Consistency (GSC) method to infer the true correspondence. Specifically GSC ens ures the preservation of geometrical structures within and between modalities al lowing for the accurate discrimination of noisy samples based on structural diff erences. Utilizing these inferred true correspondence labels GSC refines the lea rning of geometrical structures by filtering out the noisy samples. Experiments across four cross-modal datasets confirm that GSC effectively identifies noisy s amples and significantly outperforms the current leading methods. Source code is available at https://github.com/MediaBrain-SJTU/GSC.

CLiC: Concept Learning in Context
Mehdi Safaee, Aryan Mikaeili, Or Patashnik, Daniel Cohen-Or, Ali Mahdavi-Amiri; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognitio n (CVPR), 2024, pp. 6924-6933
This paper addresses the challenge of learning a local visual pattern of an obje ct from one image and generating images depicting objects with that pattern. Lea rning a localized concept and placing it on an object in a target image is a non trivial task as the objects may have different orientations and shapes. Our appr oach builds upon recent advancements in visual concept learning. It involves acq uiring a visual concept (e.g. an ornament) from a source image and subsequently applying it to an object (e.g. a chair) in a target image. Our key idea is to pe rform in-context concept learning acquiring the local visual concept within the broader context of the objects they belong to. To localize the concept learning

we employ soft masks that contain both the concept within the mask and the surrounding image area. We demonstrate our approach through object generation within an image showcasing plausible embedding of in-context learned concepts. We also introduce methods for directing acquired concepts to specific locations within target images employing cross-attention mechanisms and establishing correspondences between source and target objects. The effectiveness of our method is demonstrated through quantitative and qualitative experiments along with comparisons against baseline techniques.

CAD-SIGNet: CAD Language Inference from Point Clouds using Layer-wise Sketch Instance Guided Attention
Mohammad Sadil Khan, Elona Dupont, Sk Aziz Ali, Kseniya Cherenkova, Anis Kacem, Djamila Aouada; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 4713-4722
Reverse engineering in the realm of Computer-Aided Design (CAD) has been a longstanding aspiration though not yet entirely realized. Its primary aim is to uncover the CAD process behind a physical object given its 3D scan. We propose CAD-SIGNet an end-to-end trainable and auto-regressive architecture to recover the design history of a CAD model represented as a sequence of sketch- and-extrusion from an input point cloud. Our model learns CAD visual-language representations by layer-wise cross-attention between point cloud and CAD language embedding. In particular a new Sketch instance Guided Attention (SGA) module is proposed in order to reconstruct the fine- grained details of the sketches. Thanks to its auto-regressive nature CAD-SIGNet not only reconstructs a unique full design history of the corresponding CAD model given an in- put point cloud but also provides multiple plausible design choices. This allows for an interactive reverse engineering scenario by providing designers with multiple next step choices along with the design process. Extensive experiments on publicly available CAD datasets showcase the effectiveness of our approach against existing baseline models in two settings namely full design history recovery and conditional auto-completion from point clouds.

Object Recognition as Next Token Prediction
Kaiyu Yue, Bor-Chun Chen, Jonas Geiping, Hengduo Li, Tom Goldstein, Ser-Nam Lim; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 16645-16656
We present an approach to pose object recognition as next token prediction. The idea is to apply a language decoder that auto-regressively predicts the text tokens from image embeddings to form labels. To ground this prediction process in auto-regression we customize a non-causal attention mask for the decoder incorporating two key features: modeling tokens from different labels to be independent and treating image tokens as a prefix. This masking mechanism inspires an efficient method -- one-shot sampling -- to simultaneously sample tokens of multiple labels in parallel and rank generated labels by their probabilities during inference. To further enhance the efficiency we propose a simple strategy to construct a compact decoder by simply discarding the intermediate blocks of a pretrained language model. This approach yields a decoder that matches the full model's performance while being notably more efficient. The code is available at https://github.com/kaiyuyue/nxtp.
****
CLIB-FIQA: Face Image Quality Assessment with Confidence Calibration
Fu-Zhao Ou, Chongyi Li, Shiqi Wang, Sam Kwong; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 1694-1704
Face Image Quality Assessment (FIQA) is pivotal for guaranteeing the accuracy of face recognition in unconstrained environments. Recent progress in deep quality-fitting-based methods that train models to align with quality anchors has shown promise in FIQA. However these methods heavily depend on a recognition model to yield quality anchors and indiscriminately treat the confidence of inaccurate anchors as equivalent to that of accurate ones during the FIQA model training leading to a fitting bottleneck issue. This paper seeks a solution by putting forwa

rd the Confidence-Calibrated Face Image Quality Assessment (CLIB-FIQA) approach underpinned by the synergistic interplay between the quality anchors and objective quality factors such as blur pose expression occlusion and illumination. Specifically we devise a joint learning framework built upon the vision-language alignment model which leverages the joint distribution with multiple quality factors to facilitate the quality fitting of the FIQA model. Furthermore to alleviate the issue of the model placing excessive trust in inaccurate quality anchors we propose a confidence calibration method to correct the quality distribution by exploiting to the fullest extent of these objective quality factors characterized as the merged-factor distribution during training. Experimental results on eight datasets reveal the superior performance of the proposed method.
****
DVMNet: Computing Relative Pose for Unseen Objects Beyond Hypotheses
Chen Zhao, Tong Zhang, Zheng Dang, Mathieu Salzmann; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 20485-20495
Determining the relative pose of an object between two images is pivotal to the success of generalizable object pose estimation. Existing approaches typically approximate the continuous pose representation with a large number of discrete pose hypotheses which incurs a computationally expensive process of scoring each hypothesis at test time. By contrast we present a Deep Voxel Matching Network (DVMNet) that eliminates the need for pose hypotheses and computes the relative object pose in a single pass. To this end we map the two input RGB images reference and query to their respective voxelized 3D representations. We then pass the resulting voxels through a pose estimation module where the voxels are aligned and the pose is computed in an end-to-end fashion by solving a least-squares problem. To enhance robustness we introduce a weighted closest voxel algorithm capable of mitigating the impact of noisy voxels. We conduct extensive experiments on the CO3D LINEMOD and Objaverse datasets demonstrating that our method delivers more accurate relative pose estimates for novel objects at a lower computational cost compared to state-of-the-art methods. Our code is released at: https://github.com/sailor-z/DVMNet.

Transcriptomics-guided Slide Representation Learning in Computational Pathology
Guillaume Jaume, Lukas Oldenburg, Anurag Vaidya, Richard J. Chen, Drew F.K. Williamson, Thomas Peeters, Andrew H. Song, Faisal Mahmood; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 9632-9644
Self-supervised learning (SSL) has been successful in building patch embeddings of small histology images (e.g. 224 x 224 pixels) but scaling these models to learn slide embeddings from the entirety of giga-pixel whole-slide images (WSIs) remains challenging. Here we leverage complementary information from gene expression profiles to guide slide representation learning using multi-modal pre-training. Expression profiles constitute highly detailed molecular descriptions of a tissue that we hypothesize offer a strong task-agnostic training signal for learning slide embeddings. Our slide and expression (S+E) pretraining strategy called TANGLE employs modality-specific encoders the outputs of which are aligned via contrastive learning. TANGLE was pre-trained on samples from three different organs: liver (n=6597 S+E pairs) breast (n=1020) and lung (n=1012) from two different species (Homo sapiens and Rattus norvegicus). Across three independent test datasets consisting of 1265 breast WSIs 1946 lung WSIs and 4584 liver WSIs TANGLE shows significantly better few-shot performance compared to supervised and SSL baselines. When assessed using prototype-based classification and slide retrieval TANGLE also shows a substantial performance improvement over all baselines. Code available at https://github.com/mahmoodlab/TANGLE.

Predicated Diffusion: Predicate Logic-Based Attention Guidance for Text-to-Image Diffusion Models
Kota Sueyoshi, Takashi Matsubara; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 8651-8660

Diffusion models have achieved remarkable success in generating high-quality diverse and creative images. However in text-based image generation they often struggle to accurately capture the intended meaning of the text. For instance a specified object might not be generated or an adjective might incorrectly alter unintended objects. Moreover we found that relationships indicating possession between objects are frequently overlooked. Despite the diversity of users' intentions in text existing methods often focus on only some aspects of these intentions. In this paper we propose Predicated Diffusion a unified framework designed to more effectively express users' intentions. It represents the intended meaning as propositions using predicate logic and treats the pixels in attention maps as fuzzy predicates. This approach provides a differentiable loss function that offers guidance for the image generation process to better fulfill the propositions. Comparative evaluations with existing methods demonstrated that Predicated Diffusion excels in generating images faithful to various text prompts while maintaining high image quality as validated by human evaluators and pretrained image-text models.
****
MuRF: Multi-Baseline Radiance Fields
Haofei Xu, Anpei Chen, Yuedong Chen, Christos Sakaridis, Yulun Zhang, Marc Pollefeys, Andreas Geiger, Fisher Yu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 20041-20050
We present Multi-Baseline Radiance Fields (MuRF) a general feed-forward approach to solving sparse view synthesis under multiple different baseline settings (small and large baselines and different number of input views). To render a target novel view we discretize the 3D space into planes parallel to the target image plane and accordingly construct a target view frustum volume. Such a target volume representation is spatially aligned with the target view which effectively aggregates relevant information from the input views for high-quality rendering. It also facilitates subsequent radiance field regression with a convolutional network thanks to its axis-aligned nature. The 3D context modeled by the convolutional network enables our method to synthesis sharper scene structures than prior works. Our MuRF achieves state-of-the-art performance across multiple different baseline settings and diverse scenarios ranging from simple objects (DTU) to complex indoor and outdoor scenes (RealEstate10K and LLFF). We also show promising zero-shot generalization abilities on the Mip-NeRF 360 dataset demonstrating the general applicability of MuRF.
****
CLIP-BEVFormer: Enhancing Multi-View Image-Based BEV Detector with Ground Truth Flow
Chenbin Pan, Burhaneddin Yaman, Senem Velipasalar, Liu Ren; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 15216-15225
Autonomous driving stands as a pivotal domain in computer vision shaping the future of transportation. Within this paradigm the backbone of the system plays a crucial role in interpreting the complex environment. However a notable challenge has been the loss of clear supervision when it comes to Bird's Eye View elements. To address this limitation we introduce CLIP-BEVFormer a novel approach that leverages the power of contrastive learning techniques to enhance the multi-view image-derived BEV backbones with ground truth information flow. We conduct extensive experiments on the challenging nuScenes dataset and showcase significant and consistent improvements over the SOTA. Specifically CLIP-BEVFormer achieves an impressive 8.5% and 9.2% enhancement in terms of NDS and mAP respectively over the previous best BEV model on the 3D object detection task.

CLOVA: A Closed-LOop Visual Assistant with Tool Usage and Update
Zhi Gao, Yuntao Du, Xintong Zhang, Xiaojian Ma, Wenjuan Han, Song-Chun Zhu, Qing Li; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 13258-13268
Utilizing large language models (LLMs) to compose off-the-shelf visual tools represents a promising avenue of research for developing robust visual assistants c

apable of addressing diverse visual tasks. However these methods often overlook the potential for continual learning typically by freezing the utilized tools th us limiting their adaptation to environments requiring new knowledge. To tackle this challenge we propose CLOVA a Closed-Loop Visual Assistant which operates wi thin a framework encompassing inference reflection and learning phases. During t he inference phase LLMs generate programs and execute corresponding tools to com plete assigned tasks. In the reflection phase a multimodal global-local reflecti on scheme analyzes human feedback to determine which tools require updating. Las tly the learning phase employs three flexible approaches to automatically gather training data and introduces a novel prompt tuning scheme to update the tools a llowing CLOVA to efficiently acquire new knowledge. Experimental findings demons trate that CLOVA surpasses existing tool-usage methods by 5% in visual question answering and multiple-image reasoning by 10% in knowledge tagging and by 20% in image editing. These results underscore the significance of the continual learn ing capability in general visual assistants.

Depth Prompting for Sensor-Agnostic Depth Estimation
Jin-Hwi Park, Chanhwi Jeong, Junoh Lee, Hae-Gon Jeon; Proceedings of the IEEE/CV F Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 9859-9 869
Dense depth maps have been used as a key element of visual perception tasks. The re have been tremendous efforts to enhance the depth quality ranging from optimi zation-based to learning-based methods. Despite the remarkable progress for a lo ng time their applicability in the real world is limited due to systematic measu rement biases such as density sensing pattern and scan range. It is well-known t hat the biases make it difficult for these methods to achieve their generalizati on. We observe that learning a joint representation for input modalities (e.g. i mages and depth) which most recent methods adopt is sensitive to the biases. In this work we disentangle those modalities to mitigate the biases with prompt eng ineering. For this we design a novel depth prompt module to allow the desirable feature representation according to new depth distributions from either sensor t ypes or scene configurations. Our depth prompt can be embedded into foundation m odels for monocular depth estimation. Through this embedding process our method helps the pretrained model to be free from restraint of depth scan range and to provide absolute scale depth maps. We demonstrate the effectiveness of our metho d through extensive evaluations. Source code is publicly available at https://gi thub.com/JinhwiPark/DepthPrompting.

MoML: Online Meta Adaptation for 3D Human Motion Prediction
Xiaoning Sun, Huaijiang Sun, Bin Li, Dong Wei, Weiqing Li, Jianfeng Lu; Proceedi ngs of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR) , 2024, pp. 1042-1051
In the academic field the research on human motion prediction tasks mainly focus

es on exploiting the observed information to forecast human movements accurately in the near future horizon. However a significant gap appears when it comes to the application field as current models are all trained offline with fixed parameters that are inherently suboptimal to handle the complex yet ever-changing nature of human behaviors. To bridge this gap in this paper we introduce the task of online meta adaptation for human motion prediction based on the insight that finding "smart weights" capable of swift adjustments to suit different motion contexts along the time is a key to improving predictive accuracy. We propose MoML which ingeniously borrows the bilevel optimization spirit of model-agnostic meta-learning to transform previous predictive mistakes into strong inductive biases to guide online adaptation. This is achieved by our MoAdapter blocks that can learn error information by facilitating efficient adaptation via a few gradient steps which fine-tunes our meta-learned "smart" initialization produced by the generic predictor. Considering real-time requirements in practice we further propose Fast-MoML a more efficient variant of MoML that features a closed-form solution instead of conventional gradient update. Experimental results show that our approach can effectively bring many existing offline motion prediction models online and improves their predictive accuracy.

CAT-DM: Controllable Accelerated Virtual Try-on with Diffusion Model
Jianhao Zeng, Dan Song, Weizhi Nie, Hongshuo Tian, Tongtong Wang, An-An Liu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 8372-8382
Generative Adversarial Networks (GANs) dominate the research field in image-based virtual try-on but have not resolved problems such as unnatural deformation of garments and the blurry generation quality. While the generative quality of diffusion models is impressive achieving controllability poses a significant challenge when applying it to virtual try-on and multiple denoising iterations limit its potential for real-time applications. In this paper we propose Controllable Accelerated virtual Try-on with Diffusion Model (CAT-DM). To enhance the controllability a basic diffusion-based virtual try-on network is designed which utilizes ControlNet to introduce additional control conditions and improves the feature extraction of garment images. In terms of acceleration CAT-DM initiates a reverse denoising process with an implicit distribution generated by a pre-trained GAN-based model. Compared with previous try-on methods based on diffusion models CAT-DM not only retains the pattern and texture details of the in-shop garment but also reduces the sampling steps without compromising generation quality. Extensive experiments demonstrate the superiority of CAT-DM against both GAN-based and diffusion-based methods in producing more realistic images and accurately reproducing garment patterns.

Hyperspherical Classification with Dynamic Label-to-Prototype Assignment
Mohammad Saeed Ebrahimi Saadabadi, Ali Dabouei, Sahar Rahimi Malakshan, Nasser M. Nasrabadi; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 17333-17342
Aiming to enhance the utilization of metric space by the parametric softmax classifier recent studies suggest replacing it with a non-parametric alternative. Although a non-parametric classifier may provide better metric space utilization it introduces the challenge of capturing inter-class relationships. A shared characteristic among prior non-parametric classifiers is the static assignment of labels to prototypes during the training i.e. each prototype consistently represents a class throughout the training course. Orthogonal to previous works we present a simple yet effective method to optimize the category assigned to each prototype (label-to-prototype assignment) during the training. To this aim we formalize the problem as a two-step optimization objective over network parameters and label-to-prototype assignment mapping. We solve this optimization using a sequential combination of gradient descent and Bipartide matching. We demonstrate the benefits of the proposed approach by conducting experiments on balanced and long-tail classification problems using different backbone network architectures. In particular our method outperforms its competitors by 1.22% accuracy on CIFAR-10

0 and 2.15% on ImageNet-200 using a metric space dimension half of the size of its competitors. \href https://github.com/msed-Ebrahimi/DL2PA_CVPR24 Code

VTimeLLM: Empower LLM to Grasp Video Moments
Bin Huang, Xin Wang, Hong Chen, Zihan Song, Wenwu Zhu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 14271-14280
Large language models (LLMs) have shown remarkable text understanding capabilities which have been extended as Video LLMs to handle video data for comprehending visual details. However existing Video LLMs can only provide a coarse description of the entire video failing to capture the precise start and end time boundary of specific events. In this paper we solve this issue via proposing VTimeLLM a novel Video LLM designed for fine-grained video moment understanding and reasoning with respect to time boundary. Specifically our VTimeLLM adopts a boundary-aware three-stage training strategy which respectively utilizes image-text pairs for feature alignment multiple-event videos to increase temporal-boundary awareness and high-quality video-instruction tuning to further improve temporal understanding ability as well as align with human intents. Extensive experiments demonstrate that in fine-grained time-related comprehension tasks for videos such as Temporal Video Grounding and Dense Video Captioning VTimeLLM significantly outperforms existing Video LLMs. Besides benefits from the fine-grained temporal understanding of the videos further enable VTimeLLM to beat existing Video LLMs in video dialogue benchmark showing its superior cross-modal understanding and reasoning abilities.

FLHetBench: Benchmarking Device and State Heterogeneity in Federated Learning
Junyuan Zhang, Shuang Zeng, Miao Zhang, Runxi Wang, Feifei Wang, Yuyin Zhou, Paul Pu Liang, Liangqiong Qu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 12098-12108
Federated learning (FL) is a powerful technology that enables collaborative training of machine learning models without sharing private data among clients. The fundamental challenge in FL lies in learning over extremely heterogeneous data distributions device capacities and device state availabilities all of which adversely impact performance and communication efficiency. While data heterogeneity has been well-studied in the literature this paper introduces FLHetBench the first FL benchmark targeted toward understanding device and state heterogeneity. FLHetBench comprises two new sampling methods to generate real-world device and state databases with varying heterogeneity and new metrics for quantifying the success of FL methods under these real-world constraints. Using FLHetBench we conduct a comprehensive evaluation of existing methods and find that they struggle under these settings which inspires us to propose BiasPrompt+ a new method employing staleness-aware aggregation and fast weights to tackle these new heterogeneity challenges. Experiments on various FL tasks and datasets validate the effectiveness of our BiasPrompt+ method and highlight the value of FLHetBench in fostering the development of more efficient and robust FL solutions under real-world device and state constraints.

Flattening the Parent Bias: Hierarchical Semantic Segmentation in the Poincare Ball
Simon Weber, Bar?? Zöngür, Nikita Araslanov, Daniel Cremers; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 28223-28232
Hierarchy is a natural representation of semantic taxonomies including the ones routinely used in image segmentation. Indeed recent work on semantic segmentation reports improved accuracy from supervised training leveraging hierarchical label structures. Encouraged by these results we revisit the fundamental assumptions behind that work. We postulate and then empirically verify that the reasons for the observed improvement in segmentation accuracy may be entirely unrelated to the use of the semantic hierarchy. To demonstrate this we design a range of cross-domain experiments with a representative hierarchical approach. We find that

on the new testing domains a flat (non-hierarchical) segmentation network in which the parents are inferred from the children has superior segmentation accuracy to the hierarchical approach across the board. Complementing these findings and inspired by the intrinsic properties of hyperbolic spaces we study a more principled approach to hierarchical segmentation using the Poincare ball model. The hyperbolic representation largely outperforms the previous (Euclidean) hierarchical approach as well and is on par with our flat Euclidean baseline in terms of segmentation accuracy. However it additionally exhibits surprisingly strong calibration quality of the parent nodes in the semantic hierarchy especially on the more challenging domains. Our combined analysis suggests that the established practice of hierarchical segmentation may be limited to in-domain settings whereas flat classifiers generalize substantially better especially if they are modeled in the hyperbolic space.

Privacy-Preserving Optics for Enhancing Protection in Face De-Identification
Jhon Lopez, Carlos Hinojosa, Henry Arguello, Bernard Ghanem; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 12120-12129
The modern surge in camera usage alongside widespread computer vision technology applications poses significant privacy and security concerns. Current artificial intelligence (AI) technologies aid in recognizing relevant events and assisting in daily tasks in homes offices hospitals etc. The need to access or process personal information for these purposes raises privacy concerns. While software-level solutions like face de-identification provide a good privacy/utility trade-off they present vulnerabilities to sniffing attacks. In this paper we propose a hardware-level face de-identification method to solve this vulnerability. Specifically our approach first learns an optical encoder along with a regression model to obtain a face heatmap while hiding the face identity from the source image. We also propose an anonymization framework that generates a new face using the privacy-preserving image face heatmap and a reference face image from a public dataset as input. We validate our approach with extensive simulations and hardware experiments.

SmartRefine: A Scenario-Adaptive Refinement Framework for Efficient Motion Prediction
Yang Zhou, Hao Shao, Letian Wang, Steven L. Waslander, Hongsheng Li, Yu Liu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 15281-15290
Predicting the future motion of surrounding agents is essential for autonomous vehicles (AVs) to operate safely in dynamic human-robot-mixed environments. Context information such as road maps and surrounding agents' states provides crucial geometric and semantic information for motion behavior prediction. To this end recent works explore two-stage prediction frameworks where coarse trajectories are first proposed and then used to select critical context information for trajectory refinement. However they either incur a large amount of computation or bring limited improvement if not both. In this paper we introduce a novel scenario-adaptive refinement strategy named SmartRefine to refine prediction with minimal additional computation. Specifically SmartRefine can comprehensively adapt refinement configurations based on each scenario's properties and smartly chooses the number of refinement iterations by introducing a quality score to measure the prediction quality and remaining refinement potential of each scenario. SmartRefine is designed as a generic and flexible approach that can be seamlessly integrated into most state-of-the-art motion prediction models. Experiments on Argoverse (1 & 2) show that our method consistently improves the prediction accuracy of multiple state-of-the-art prediction models. Specifically by adding SmartRefine to QCNet we outperform all published ensemble-free works on the Argoverse 2 leaderboard (single agent track) at submission. Comprehensive studies are also conducted to ablate design choices and explore the mechanism behind multi-iteration refinement. Codes are available at https://github.com/opendilab/SmartRefine/.

MVBench: A Comprehensive Multi-modal Video Understanding Benchmark
Kunchang Li, Yali Wang, Yinan He, Yizhuo Li, Yi Wang, Yi Liu, Zun Wang, Jilan Xu, Guo Chen, Ping Luo, Limin Wang, Yu Qiao; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 22195-22206
With the rapid development of Multi-modal Large Language Models (MLLMs) a number of diagnostic benchmarks have recently emerged to evaluate the comprehension capabilities of these models. However most benchmarks predominantly assess spatial understanding in the static image tasks while overlooking temporal understanding in the dynamic video tasks. To alleviate this issue we introduce a comprehensive Multi-modal Video understanding Benchmark namely MVBench which covers 20 challenging video tasks that cannot be effectively solved with a single frame. Specifically we first introduce a novel static-to-dynamic method to define these temporal-related tasks. By transforming various static tasks into dynamic ones we enable the systematic generation of video tasks that require a broad spectrum of temporal skills ranging from perception to cognition. Then guided by the task definition we automatically convert public video annotations into multiple-choice QA to evaluate each task. On one hand such a distinct paradigm allows us to build MVBench efficiently without much manual intervention. On the other hand it guarantees evaluation fairness with ground-truth video annotations avoiding the biased scoring of LLMs. Moreover we further develop a robust video MLLM baseline i.e. VideoChat2 by progressive multi-modal training with diverse instruction-tuning data. The extensive results on our MVBench reveal that the existing MLLMs are far from satisfactory in temporal understanding while our VideoChat2 largely surpasses these leading models by over 15% on MVBench.

Multi-Scale Video Anomaly Detection by Multi-Grained Spatio-Temporal Representation Learning
Menghao Zhang, Jingyu Wang, Qi Qi, Haifeng Sun, Zirui Zhuang, Pengfei Ren, Ruilong Ma, Jianxin Liao; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 17385-17394
ecent progress in video anomaly detection suggests that the features of appearance and motion play crucial roles in distinguishing abnormal patterns from normal ones. However we note that the effect of spatial scales of anomalies is ignored. The fact that many abnormal events occur in limited localized regions and severe background noise interferes with the learning of anomalous changes. Meanwhile most existing methods are limited by coarse-grained modeling approaches which are inadequate for learning highly discriminative features to discriminate subtle differences between small-scale anomalies and normal patterns. To this end this paper address multi-scale video anomaly detection by multi-grained spatio-temporal representation learning. We utilize video continuity to design three proxy tasks to perform feature learning at both coarse-grained and fine-grained levels i.e. continuity judgment discontinuity localization and missing frame estimation. In particular we formulate missing frame estimation as a contrastive learning task in feature space instead of a reconstruction task in RGB space to learn highly discriminative features. Experiments show that our proposed method outperforms state-of-the-art methods on four datasets especially in scenes with small-scale anomalies.

An Aggregation-Free Federated Learning for Tackling Data Heterogeneity
Yuan Wang, Huazhu Fu, Renuga Kanagavelu, Qingsong Wei, Yong Liu, Rick Siow Mong Goh; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 26233-26242
The performance of Federated Learning (FL) hinges on the effectiveness of utilizing knowledge from distributed datasets. Traditional FL methods adopt an aggregate-then-adapt framework where clients update local models based on a global model aggregated by the server from the previous training round. This process can cause client drift especially with significant cross-client data heterogeneity impacting model performance and convergence of the FL algorithm. To address these challenges we introduce FedAF a novel aggregation-free FL algorithm. In this framework clients collaboratively learn condensed data by leveraging peer knowledge

the server subsequently trains the global model using the condensed data and sof
t labels received from the clients. FedAF inherently avoids the issue of client
drift enhances the quality of condensed data amid notable data heterogeneity and
 improves the global model performance. Extensive numerical studies on several p
opular benchmark datasets show FedAF surpasses various state-of-the-art FL algor
ithms in handling label-skew and feature-skew data heterogeneity leading to supe
rior global model accuracy and faster convergence.

Generative Multimodal Models are In-Context Learners
Quan Sun, Yufeng Cui, Xiaosong Zhang, Fan Zhang, Qiying Yu, Yueze Wang, Yongming
 Rao, Jingjing Liu, Tiejun Huang, Xinlong Wang; Proceedings of the IEEE/CVF Conf
erence on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 14398-14409
Humans can easily solve multimodal tasks in context with only a few demonstratio
ns or simple instructions which current multimodal systems largely struggle to i
mitate. In this work we demonstrate that by effectively scaling up generative mu
ltimodal models their task-agnostic in-context learning capabilities can be sign
ificantly enhanced. We introduce Emu2 a generative multimodal model with 37 bill
ion parameters which serves as a base model and general-purpose interface for a
variety of multimodal tasks. Emu2 not only achieves strong performance in few-sh
ot setting but can also be instruct-tuned to follow specific instructions such a
s visual question answering and object-grounded image generation. Emu2 even emer
ges to solve tasks that require on-the-fly reasoning such as visual prompting wh
ich existing models are unlikely to handle. We identify additional tasks where E
mu2's in-context learning can further improve and discuss its broader societal i
mpact. Our code and models will be made publicly available to facilitate future
research.

Synergistic Global-space Camera and Human Reconstruction from Videos
Yizhou Zhao, Tuanfeng Yang Wang, Bhiksha Raj, Min Xu, Jimei Yang, Chun-Hao Paul
Huang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Rec
ognition (CVPR), 2024, pp. 1216-1226
Remarkable strides have been made in reconstructing static scenes or human bodie
s from monocular videos. Yet the two problems have largely been approached indep
endently without much synergy. Most visual SLAM methods can only reconstruct cam
era trajectories and scene structures up to scale while most HMR methods reconst
ruct human meshes in metric scale but fall short in reasoning with cameras and s
cenes. This work introduces Synergistic Camera and Human Reconstruction (SynCHMR
) to marry the best of both worlds. Specifically we design Human-aware Metric SL
AM to reconstruct metric-scale camera poses and scene point clouds using camera-
frame HMR as a strong prior addressing depth scale and dynamic ambiguities. Cond
itioning on the dense scene recovered we further learn a Scene-aware SMPL Denois
er to enhance world-frame HMR by incorporating spatiotemporal coherency and dyna
mic scene constraints. Together they lead to consistent reconstructions of camer
a trajectories human meshes and dense scene point clouds in a common world frame

Hierarchical Intra-modal Correlation Learning for Label-free 3D Semantic Segment
ation
Xin Kang, Lei Chu, Jiahao Li, Xuejin Chen, Yan Lu; Proceedings of the IEEE/CVF C
onference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 28244-282
53
Recent methods for label-free 3D semantic segmentation aim to assist 3D model tr
aining by leveraging the open-world recognition ability of pre-trained vision la
nguage models. However these methods usually suffer from inconsistent and noisy
pseudo-labels provided by the vision language models. To address this issue we p
resent a hierarchical intra-modal correlation learning framework that captures v
isual and geometric correlations in 3D scenes at three levels: intra-set intra-s
cene and inter-scene to help learn more compact 3D representations. We refine ps
eudo-labels using intra-set correlations within each geometric consistency set a
nd align features of visually and geometrically similar points using intra-scene

and inter-scene correlation learning. We also introduce a feedback mechanism to distill the correlation learning capability into the 3D model. Experiments on both indoor and outdoor datasets show the superiority of our method. We achieve a state-of-the-art 36.6% mIoU on the ScanNet dataset and a 23.0% mIoU on the nuScenes dataset with improvements of 7.8% mIoU and 2.2% mIoU compared with previous SOTA. We also provide theoretical analysis and qualitative visualization results to discuss the mechanism and conduct thorough ablation studies to support the effectiveness of our framework.

Feature Re-Embedding: Towards Foundation Model-Level Performance in Computational Pathology
Wenhao Tang, Fengtao Zhou, Sheng Huang, Xiang Zhu, Yi Zhang, Bo Liu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 11343-11352
Multiple instance learning (MIL) is the most widely used framework in computational pathology encompassing sub-typing diagnosis prognosis and more. However the existing MIL paradigm typically requires an offline instance feature extractor such as a pre-trained ResNet or a foundation model. This approach lacks the capability for feature fine-tuning within the specific downstream tasks limiting its adaptability and performance. To address this issue we propose a Re-embedded Regional Transformer (RRT) for re-embedding the instance features online which captures fine-grained local features and establishes connections across different regions. Unlike existing works that focus on pre-training powerful feature extractor or designing sophisticated instance aggregator RRT is tailored to re-embed instance features online. It serves as a portable module that can seamlessly integrate into mainstream MIL models. Extensive experimental results on common computational pathology tasks validate that: 1) feature re-embedding improves the performance of MIL models based on ResNet-50 features to the level of foundation model features and further enhances the performance of foundation model features; 2) the RRT can introduce more significant performance improvements to various MIL models; 3) RRT-MIL as an RRT-enhanced AB-MIL outperforms other latest methods by a large margin. The code is available at: https://github.com/DearCaat/RRT-MIL.

DiffSal: Joint Audio and Video Learning for Diffusion Saliency Prediction
Junwen Xiong, Peng Zhang, Tao You, Chuanyue Li, Wei Huang, Yufei Zha; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 27273-27283
Audio-visual saliency prediction can draw support from diverse modality complements but further performance enhancement is still challenged by customized architectures as well as task-specific loss functions. In recent studies denoising diffusion models have shown more promising in unifying task frameworks owing to their inherent ability of generalization. Following this motivation a novel Diffusion architecture for generalized audio-visual Saliency prediction (DiffSal) is proposed in this work which formulates the prediction problem as a conditional generative task of the saliency map by utilizing input audio and video as the conditions. Based on the spatio-temporal audio-visual features an extra network Saliency-UNet is designed to perform multi-modal attention modulation for progressive refinement of the ground-truth saliency map from the noisy map. Extensive experiments demonstrate that the proposed DiffSal can achieve excellent performance across six challenging audio-visual benchmarks with an average relative improvement of 6.3% over the previous state-of-the-art results by six metrics.

Revisiting Single Image Reflection Removal In the Wild
Yurui Zhu, Xueyang Fu, Peng-Tao Jiang, Hao Zhang, Qibin Sun, Jinwei Chen, Zheng-Jun Zha, Bo Li; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 25468-25478
This research focuses on the issue of single-image reflection removal (SIRR) in real-world conditions examining it from two angles: the collection pipeline of real reflection pairs and the perception of real reflection locations. We devise an advanced reflection collection pipeline that is highly adaptable to a wide ra

nge of real-world reflection scenarios and incurs reduced costs in collecting la
rge-scale aligned reflection pairs. In the process we develop a large-scale high
-quality reflection dataset named Reflection Removal in the Wild (RRW). RRW cont
ains over 14950 high-resolution real-world reflection pairs a dataset forty-five
 times larger than its predecessors. Regarding perception of reflection location
s we identify that numerous virtual reflection objects visible in reflection ima
ges are not present in the corresponding ground-truth images. This observation d
rawn from the aligned pairs leads us to conceive the Maximum Reflection Filter (
MaxRF). The MaxRF could accurately and explicitly characterize reflection locati
ons from pairs of images. Building upon this we design a reflection location-awa
re cascaded framework specifically tailored for SIRR. Powered by these innovativ
e techniques our solution achieves superior performance than current leading met
hods across multiple real-world benchmarks. Codes and datasets are available at
\href https://github.com/zhuyr97/Reflection_RemoVal_CVPR2024 \color blue here

3D Face Reconstruction with the Geometric Guidance of Facial Part Segmentation
Zidu Wang, Xiangyu Zhu, Tianshuo Zhang, Baiqin Wang, Zhen Lei; Proceedings of th
e IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, p
p. 1672-1682
3D Morphable Models (3DMMs) provide promising 3D face reconstructions in various
 applications. However existing methods struggle to reconstruct faces with extre
me expressions due to deficiencies in supervisory signals such as sparse or inac
curate landmarks. Segmentation information contains effective geometric contexts
 for face reconstruction. Certain attempts intuitively depend on differentiable
renderers to compare the rendered silhouettes of reconstruction with segmentatio
n which is prone to issues like local optima and gradient instability. In this p
aper we fully utilize the facial part segmentation geometry by introducing Part
Re-projection Distance Loss (PRDL). Specifically PRDL transforms facial part seg
mentation into 2D points and re-projects the reconstruction onto the image plane
. Subsequently by introducing grid anchors and computing different statistical d
istances from these anchors to the point sets PRDL establishes geometry descript
ors to optimize the distribution of the point sets for face reconstruction. PRDL
 exhibits a clear gradient compared to the renderer-based methods and presents s
tate-of-the-art reconstruction performance in extensive quantitative and qualita
tive experiments. Our project is available at https://github.com/wang-zidu/3DDFA
-V3.

FreeU: Free Lunch in Diffusion U-Net
Chenyang Si, Ziqi Huang, Yuming Jiang, Ziwei Liu; Proceedings of the IEEE/CVF Co
nference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 4733-4743
In this paper we uncover the untapped potential of diffusion U-Net which serves
as a "free lunch" that substantially improves the generation quality on the fly.
 We initially investigate the key contributions of the U-Net architecture to the
 denoising process and identify that its main backbone primarily contributes to
denoising whereas its skip connections mainly introduce high-frequency features
into the decoder module causing the potential neglect of crucial functions intri
nsic to the backbone network. Capitalizing on this discovery we propose a simple
 yet effective method termed "FreeU" which enhances generation quality without a
dditional training or finetuning. Our key insight is to strategically re-weight
the contributions sourced from the U-Net's skip connections and backbone feature
 maps to leverage the strengths of both components of the U-Net architecture. Pr
omising results on image and video generation tasks demonstrate that our FreeU c
an be readily integrated to existing diffusion models e.g. Stable Diffusion Drea
mBooth and ControlNet to improve the generation quality with only a few lines of
 code. All you need is to adjust two scaling factors during inference.

Text Prompt with Normality Guidance for Weakly Supervised Video Anomaly Detectio
n
Zhiwei Yang, Jing Liu, Peng Wu; Proceedings of the IEEE/CVF Conference on Comput

er Vision and Pattern Recognition (CVPR), 2024, pp. 18899-18908
Weakly supervised video anomaly detection (WSVAD) is a challenging task. Generat
ing fine-grained pseudo-labels based on weak-label and then self-training a clas
sifier is currently a promising solution. However since the existing methods use
 only RGB visual modality and the utilization of category text information is ne
glected thus limiting the generation of more accurate pseudo-labels and affectin
g the performance of self-training. Inspired by the manual labeling process base
d on the event description in this paper we propose a novel pseudo-label generat
ion and self-training framework based on Text Prompt with Normality Guidance (TP
WNG) for WSVAD. Our idea is to transfer the rich language-visual knowledge of th
e contrastive language-image pre-training (CLIP) model for aligning the video ev
ent description text and corresponding video frames to generate pseudo-labels. S
pecifically We first fine-tune the CLIP for domain adaptation by designing two r
anking losses and a distributional inconsistency loss. Further we propose a lear
nable text prompt mechanism with the assist of a normality visual prompt to furt
her improve the matching accuracy of video event description text and video fram
es. Then we design a pseudo-label generation module based on the normality guida
nce to infer reliable frame-level pseudo-labels. Finally we introduce a temporal
 context self-adaptive learning module to learn the temporal dependencies of dif
ferent video events more flexibly and accurately. Extensive experiments show tha
t our method achieves state-of-the-art performance on two benchmark datasets UCF
-Crime and XD-Violence demonstrating the effectiveness of our proposed method.

SparseOcc: Rethinking Sparse Latent Representation for Vision-Based Semantic Occ
upancy Prediction
Pin Tang, Zhongdao Wang, Guoqing Wang, Jilai Zheng, Xiangxuan Ren, Bailan Feng,
Chao Ma; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern R
ecognition (CVPR), 2024, pp. 15035-15044
Vision-based perception for autonomous driving requires an explicit modeling of
a 3D space where 2D latent representations are mapped and subsequent 3D operator
s are applied. However operating on dense latent spaces introduces a cubic time
and space complexity which limits scalability in terms of perception range or sp
atial resolution. Existing approaches compress the dense representation using pr
ojections like Bird's Eye View (BEV) or Tri-Perspective View (TPV). Although eff
icient these projections result in information loss especially for tasks like se
mantic occupancy prediction. To address this we propose SparseOcc an efficient o
ccupancy network inspired by sparse point cloud processing. It utilizes a lossle
ss sparse latent representation with three key innovations. Firstly a 3D sparse
diffuser performs latent completion using spatially decomposed 3D sparse convolu
tional kernels. Secondly a feature pyramid and sparse interpolation enhance scal
es with information from others. Finally the transformer head is redesigned as a
 sparse variant. SparseOcc achieves a remarkable 74.9% reduction on FLOPs over t
he dense baseline. Interestingly it also improves accuracy from 12.8% to 14.1% m
IOU which in part can be attributed to the sparse representation's ability to av
oid hallucinations on empty voxels.

SinSR: Diffusion-Based Image Super-Resolution in a Single Step
Yufei Wang, Wenhan Yang, Xinyuan Chen, Yaohui Wang, Lanqing Guo, Lap-Pui Chau, Z
iwei Liu, Yu Qiao, Alex C. Kot, Bihan Wen; Proceedings of the IEEE/CVF Conferenc
e on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 25796-25805
While super-resolution (SR) methods based on diffusion models exhibit promising
results their practical application is hindered by the substantial number of req
uired inference steps. Recent methods utilize the degraded images in the initial
 state thereby shortening the Markov chain. Nevertheless these solutions either
rely on a precise formulation of the degradation process or still necessitate a
relatively lengthy generation path (e.g. 15 iterations). To enhance inference sp
eed we propose a simple yet effective method for achieving single-step SR genera
tion named SinSR. Specifically we first derive a deterministic sampling process
from the most recent state-of-the-art (SOTA) method for accelerating diffusion-b
ased SR. This allows the mapping between the input random noise and the generate

d high-resolution image to be obtained in a reduced and acceptable number of inference steps during training. We show that this deterministic mapping can be distilled into a student model that performs SR within only one inference step. Additionally we propose a novel consistency-preserving loss to simultaneously leverage the ground-truth image during the distillation process ensuring that the performance of the student model is not solely bound by the feature manifold of the teacher model resulting in further performance improvement. Extensive experiments conducted on synthetic and real-world datasets demonstrate that the proposed method can achieve comparable or even superior performance compared to both previous SOTA methods and the teacher model in just one sampling step resulting in a remarkable up to x10 speedup for inference. Our code will be released at https://github.com/wyf0912/SinSR/.

Frequency Decoupling for Motion Magnification via Multi-Level Isomorphic Architecture
Fei Wang, Dan Guo, Kun Li, Zhun Zhong, Meng Wang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 18984-18994
Video Motion Magnification (VMM) aims to reveal subtle and imperceptible motion information of objects in the macroscopic world. Prior methods directly model the motion field from the Eulerian perspective by Representation Learning that separates shape and texture or Multi-domain Learning from phase fluctuations. Inspired by the frequency spectrum we observe that the low-frequency components with stable energy always possess spatial structure and less noise making them suitable for modeling the subtle motion field. To this end we present FD4MM a new paradigm of Frequency Decoupling for Motion Magnification with a Multi-level Isomorphic Architecture to capture multi-level high-frequency details and a stable low-frequency structure (motion field) in video space. Since high-frequency details and subtle motions are susceptible to information degradation due to their inherent subtlety and unavoidable external interference from noise we carefully design Sparse High/Low-pass Filters to enhance the integrity of details and motion structures and a Sparse Frequency Mixer to promote seamless recoupling. Besides we innovatively design a contrastive regularization for this task to strengthen the model's ability to discriminate irrelevant features reducing undesired motion magnification. Extensive experiments on both Real-world and Synthetic Datasets show that our FD4MM outperforms SOTA methods. Meanwhile FD4MM reduces FLOPs by 1.63xand boosts inference speed by 1.68xthan the latest method. Our code is available at https://github.com/Jiafei127/FD4MM.

Systematic Comparison of Semi-supervised and Self-supervised Learning for Medical Image Classification
Zhe Huang, Ruijie Jiang, Shuchin Aeron, Michael C. Hughes; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 22282-22293
In typical medical image classification problems labeled data is scarce while unlabeled data is more available. Semi-supervised learning and self-supervised learning are two different research directions that can improve accuracy by learning from extra unlabeled data. Recent methods from both directions have reported significant gains on traditional benchmarks. Yet past benchmarks do not focus on medical tasks and rarely compare self- and semi- methods together on an equal footing. Furthermore past benchmarks often handle hyperparameter tuning suboptimally. First they may not tune hyperparameters at all leading to underfitting. Second when tuning does occur it often unrealistically uses a labeled validation set that is much larger than the training set. Therefore currently published rankings might not always corroborate with their practical utility This study contributes a systematic evaluation of self- and semi- methods with a unified experimental protocol intended to guide a practitioner with scarce overall labeled data and a limited compute budget. We answer two key questions: Can hyperparameter tuning be effective with realistic-sized validation sets? If so when all methods are tuned well which self- or semi-supervised methods achieve the best accuracy? Ou

r study compares 13 representative semi- and self-supervised methods to strong l abeled-set-only baselines on 4 medical datasets. From 20000+ GPU hours of comput ation we provide valuable best practices to resource-constrained practitioners: hyperparameter tuning is effective and the semi-supervised method known as MixMa tch delivers the most reliable gains across 4 datasets.

ViewDiff: 3D-Consistent Image Generation with Text-to-Image Models
Lukas Höllein, Aljaž Boži?, Norman Müller, David Novotny, Hung-Yu Tseng, Christi an Richardt, Michael Zollhöfer, Matthias Nießner; Proceedings of the IEEE/CVF Co nference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 5043-5052
3D asset generation is getting massive amounts of attention inspired by the rece nt success on text-guided 2D content creation. Existing text-to-3D methods use p retrained text-to-image diffusion models in an optimization problem or fine-tune them on synthetic data which often results in non-photorealistic 3D objects wit hout backgrounds. In this paper we present a method that leverages pretrained te xt-to-image models as a prior and learn to generate multi-view images in a singl e denoising process from real-world data. Concretely we propose to integrate 3D volume-rendering and cross-frame-attention layers into each block of the existin g U-Net network of the text-to-image model. Moreover we design an autoregressive generation that renders more 3D-consistent images at any viewpoint. We train ou r model on real-world datasets of objects and showcase its capabilities to gener ate instances with a variety of high-quality shapes and textures in authentic su rroundings. Compared to the existing methods the results generated by our method are consistent and have favorable visual quality (-30% FID -37% KID).
****
Hyperbolic Learning with Synthetic Captions for Open-World Detection
Fanjie Kong, Yanbei Chen, Jiarui Cai, Davide Modolo; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 16762-1 6771
Open-world detection poses significant challenges as it requires the detection o f any object using either object class labels or free-form texts. Existing relat ed works often use large-scale manual annotated caption datasets for training wh ich are extremely expensive to collect. Instead we propose to transfer knowledge from vision-language models (VLMs) to enrich the open-vocabulary descriptions a utomatically. Specifically we bootstrap dense synthetic captions using pre-train ed VLMs to provide rich descriptions on different regions in images and incorpor ate these captions to train a novel detector that generalizes to novel concepts. To mitigate the noise caused by hallucination in synthetic captions we also pro pose a novel hyperbolic vision-language learning approach to impose a hierarchy between visual and caption embeddings. We call our detector "HyperLearner". We c onduct extensive experiments on a wide variety of open-world detection benchmark s (COCO LVIS Object Detection in the Wild RefCOCO) and our results show that our model consistently outperforms existing state-of-the-art methods such as GLIP G LIPv2 and Grounding DINO when using the same backbone.
****
Diffusion Models Without Attention
Jing Nathan Yan, Jiatao Gu, Alexander M. Rush; Proceedings of the IEEE/CVF Confe rence on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 8239-8249
In recent advancements in high-fidelity image generation Denoising Diffusion Pro babilistic Models (DDPMs) have emerged as a key player. However their applicatio n at high resolutions presents significant computational challenges. Current met hods such as patchifying expedite processes in UNet and Transformer architecture s but at the expense of representational capacity. Addressing this we introduce the Diffusion State Space Model (DiffuSSM) an architecture that supplants attent ion mechanisms with a more scalable state space model backbone. This approach ef fectively handles higher resolutions without resorting to global compression thu s preserving detailed image representation throughout the diffusion process. Our focus on FLOP-efficient architectures in diffusion training marks a significant step forward. Comprehensive evaluations on both ImageNet and LSUN datasets at t wo resolutions demonstrate that DiffuSSMs are on par or even outperform existing

diffusion models with attention modules in FID and Inception Score metrics whil
e significantly reducing total FLOP usage.

Interpretable Measures of Conceptual Similarity by Complexity-Constrained Descri
ptive Auto-Encoding
Alessandro Achille, Greg Ver Steeg, Tian Yu Liu, Matthew Trager, Carson Klingenb
erg, Stefano Soatto; Proceedings of the IEEE/CVF Conference on Computer Vision a
nd Pattern Recognition (CVPR), 2024, pp. 11062-11071
Quantifying the degree of similarity between images is a key copyright issue for
 image-based machine learning. In legal doctrine however determining the degree
of similarity between works requires subjective analysis and fact-finders (judge
s and juries) can demonstrate considerable variability in these subjective judge
ment calls. Images that are structurally similar can be deemed dissimilar wherea
s images of completely different scenes can be deemed similar enough to support
a claim of copying. We seek to define and compute a notion of "conceptual simila
rity" among images that captures high-level relations even among images that do
not share repeated elements or visually similar components. The idea is to use a
 base multi-modal model to generate "explanations" (captions) of visual data at
increasing levels of complexity. Then similarity can be measured by the length o
f the caption needed to discriminate between the two images: Two highly dissimil
ar images can be discriminated early in their description whereas conceptually d
issimilar ones will need more detail to be distinguished. We operationalize this
 definition and show that it correlates with subjective (averaged human evaluati
on) assessment and beats existing baselines on both image-to-image and text-to-t
ext similarity benchmarks. Beyond just providing a number our method also offers
 interpretability by pointing to the specific level of granularity of the descri
ption where the source data is differentiated.

Emotional Speech-driven 3D Body Animation via Disentangled Latent Diffusion
Kiran Chhatre, Radek Dan??ek, Nikos Athanasiou, Giorgio Becherini, Christopher P
eters, Michael J. Black, Timo Bolkart; Proceedings of the IEEE/CVF Conference on
 Computer Vision and Pattern Recognition (CVPR), 2024, pp. 1942-1953
Existing methods for synthesizing 3D human gestures from speech have shown promi
sing results but they do not explicitly model the impact of emotions on the gene
rated gestures. Instead these methods directly output animations from speech wit
hout control over the expressed emotion. To address this limitation we present A
MUSE an emotional speech-driven body animation model based on latent diffusion.
Our observation is that content (i.e. gestures related to speech rhythm and word
 utterances) emotion and personal style are separable. To account for this AMUSE
 maps the driving audio to three disentangled latent vectors: one for content on
e for emotion and one for personal style. A latent diffusion model trained to ge
nerate gesture motion sequences is then conditioned on these latent vectors. Onc
e trained AMUSE synthesizes 3D human gestures directly from speech with control
over the expressed emotions and style by combining the content from the driving
speech with the emotion and style of another speech sequence. Randomly sampling
the noise of the diffusion model further generates variations of the gesture wit
h the same emotional expressivity. Qualitative quantitative and perceptual evalu
ations demonstrate that AMUSE outputs realistic gesture sequences. Compared to t
he state of the art the generated gestures are better synchronized with the spee
ch content and better represent the emotion expressed by the input speech. Our c
ode is available at amuse.is.tue.mpg.de.

3D Feature Tracking via Event Camera
Siqi Li, Zhikuan Zhou, Zhou Xue, Yipeng Li, Shaoyi Du, Yue Gao; Proceedings of t
he IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024,
pp. 18974-18983
This paper presents the first 3D feature tracking method with the corresponding
dataset. Our proposed method takes event streams from stereo event cameras as in
put to predict 3D trajectories of the target features with high-speed motion. To
 achieve this our method leverages a joint framework to predict the 2D feature m

otion offsets and the 3D feature spatial position simultaneously. A motion compe
nsation module is leveraged to overcome the feature deformation. A patch matchin
g module based on bi-polarity hypergraph modeling is proposed to robustly estima
te the feature spatial position. Meanwhile we collect the first 3D feature track
ing dataset with high-speed moving objects and ground truth 3D feature trajector
ies at 250 FPS named E-3DTrack which can be used as the first high-speed 3D feat
ure tracking benchmark. Our code and dataset could be found at: https://github.c
om/lisiqi19971013/E-3DTrack.

Retrieval-Augmented Layout Transformer for Content-Aware Layout Generation
Daichi Horita, Naoto Inoue, Kotaro Kikuchi, Kota Yamaguchi, Kiyoharu Aizawa; Pro
ceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (
CVPR), 2024, pp. 67-76
Content-aware graphic layout generation aims to automatically arrange visual ele
ments along with a given content such as an e-commerce product image. In this pa
per we argue that the current layout generation approaches suffer from the limit
ed training data for the high-dimensional layout structure. We show that a simpl
e retrieval augmentation can significantly improve the generation quality. Our m
odel which is named Retrieval-Augmented Layout Transformer (RALF) retrieves near
est neighbor layout examples based on an input image and feeds these results int
o an autoregressive generator. Our model can apply retrieval augmentation to var
ious controllable generation tasks and yield high-quality layouts within a unifi
ed architecture. Our extensive experiments show that RALF successfully generates
 content-aware layouts in both constrained and unconstrained settings and signif
icantly outperforms the baselines.

MSU-4S - The Michigan State University Four Seasons Dataset
Daniel Kent, Mohammed Alyaqoub, Xiaohu Lu, Hamed Khatounabadi, Kookjin Sung, Col
e Scheller, Alexander Dalat, Asma bin Thabit, Roberto Whitley, Hayder Radha; Pro
ceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (
CVPR), 2024, pp. 22658-22667
Public datasets such as KITTI nuScenes and Waymo have played a key role in the r
esearch and development of autonomous vehicles and advanced driver assistance sy
stems. However many of these datasets fail to incorporate a full range of drivin
g conditions; some datasets only contain clear-weather conditions underrepresent
ing or entirely missing colder weather conditions such as snow or autumn scenes
with bright colorful foliage. In this paper we present the Michigan State Univer
sity Four Seasons (MSU-4S) Dataset which contains real-world collections of auto
nomous vehicle data from varied types of driving scenarios. These scenarios were
 recorded throughout a full range of seasons and capture clear rainy snowy and f
all weather conditions at varying times of day. MSU-4S contains more than 100000
 two- and three-dimensional frames for camera lidar and radar data as well as Gl
obal Navigation Satellite System (GNSS) wheel speed and steering data all annota
ted with weather time-of-day and time-of-year. Our data includes cluttered scene
s that have large numbers of vehicles and pedestrians; and it also captures indu
strial scenes busy traffic thoroughfare with traffic lights and numerous signs a
nd scenes with dense foliage. While providing a diverse set of scenes our data i
ncorporate an important feature: virtually every scene and its corresponding lid
ar camera and radar frames were captured in four different seasons enabling unpa
ralleled object detection analysis and testing of the domain shift problem acros
s weather conditions. In that context we present detailed analyses for 3D and 2D
 object detection showing a strong domain shift effect among MSU-4S data segment
s collected across different conditions. MSU-4S will also enable advanced multim
odal fusion research including different combinations of camera-lidar-radar fusi
on which continues to be of strong interest for the computer vision autonomous d
riving and ADAS development communities. The MSU-4S dataset is available online
at https://egr.msu.edu/waves/msu4s.

Improving Plasticity in Online Continual Learning via Collaborative Learning
Maorong Wang, Nicolas Michel, Ling Xiao, Toshihiko Yamasaki; Proceedings of the

IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 23460-23469
Online Continual Learning (CL) solves the problem of learning the ever-emerging new classification tasks from a continuous data stream. Unlike its offline counterpart in online CL the training data can only be seen once. Most existing online CL research regards catastrophic forgetting (i.e. model stability) as almost the only challenge. In this paper we argue that the model's capability to acquire new knowledge (i.e. model plasticity) is another challenge in online CL. While replay-based strategies have been shown to be effective in alleviating catastrophic forgetting there is a notable gap in research attention toward improving model plasticity. To this end we propose Collaborative Continual Learning (CCL) a collaborative learning based strategy to improve the model's capability in acquiring new concepts. Additionally we introduce Distillation Chain (DC) a collaborative learning scheme to boost the training of the models. We adapt CCL-DC to existing representative online CL works. Extensive experiments demonstrate that even if the learners are well-trained with state-of-the-art online CL methods our strategy can still improve model plasticity dramatically and thereby improve the overall performance by a large margin. The source code of our work is available at https://github.com/maorong-wang/CCL-DC.

InstantBooth: Personalized Text-to-Image Generation without Test-Time Finetuning
Jing Shi, Wei Xiong, Zhe Lin, Hyun Joon Jung; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 8543-8552
Recent advances in personalized image generation have enabled pre-trained text-to-image models to learn new concepts from specific image sets. However these methods often necessitate extensive test-time finetuning for each new concept leading to inefficiencies in both time and scalability. To address this challenge we introduce InstantBooth an innovative approach leveraging existing text-to-image models for instantaneous text-guided image personalization eliminating the need for test-time finetuning. This efficiency is achieved through two primary innovations. Firstly we utilize an image encoder that transforms input images into a global embedding to grasp the general concept. Secondly we integrate new adapter layers into the pre-trained model enhancing its ability to capture intricate identity details while maintaining language coherence. Significantly our model is trained exclusively on text-image pairs without reliance on concept-specific paired images. When benchmarked against existing finetuning-based personalization techniques like DreamBooth and Textual-Inversion InstantBooth not only shows comparable proficiency in aligning language with image maintaining image quality and preserving identity but also boasts a 100-fold increase in processing speed.
****
MaxQ: Multi-Axis Query for N:M Sparsity Network
Jingyang Xiang, Siqi Li, Junhao Chen, Zhuangzhi Chen, Tianxin Huang, Linpeng Peng, Yong Liu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 15845-15854
N:M sparsity has received increasing attention due to its remarkable performance and latency trade-off compared with structured and unstructured sparsity. However existing N:M sparsity methods do not differentiate the relative importance of weights among blocks and leave important weights underappreciated. Besides they directly apply N:M sparsity to the whole network which will cause severe information loss. Thus they are still sub-optimal. In this paper we propose an efficient and effective Multi-Axis Query methodology dubbed as MaxQ to rectify these problems. During the training MaxQ employs a dynamic approach to generate soft N:M masks considering the weight importance across multiple axes. This method enhances the weights with more importance and ensures more effective updates. Meanwhile a sparsity strategy that gradually increases the percentage of N:M weight blocks is applied which allows the network to heal from the pruning-induced damage progressively. During the runtime the N:M soft masks can be precomputed as constants and folded into weights without causing any distortion to the sparse pattern and incurring additional computational overhead. Comprehensive experiments demonstrate that MaxQ achieves consistent improvements across diverse CNN architect

ures in various computer vision tasks including image classification object detection and instance segmentation. For ResNet50 with 1:16 sparse pattern MaxQ can achieve 74.6% top-1 accuracy on ImageNet and improve by over 2.8% over the state-of-the-art. Codes and checkpoints are available at https://github.com/JingyangXiang/MaxQ.

Part-aware Unified Representation of Language and Skeleton for Zero-shot Action Recognition
Anqi Zhu, Qiuhong Ke, Mingming Gong, James Bailey; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 18761-18770
While remarkable progress has been made on supervised skeleton-based action recognition the challenge of zero-shot recognition remains relatively unexplored. In this paper we argue that relying solely on aligning label-level semantics and global skeleton features is insufficient to effectively transfer locally consistent visual knowledge from seen to unseen classes. To address this limitation we introduce Part-aware Unified Representation between Language and Skeleton (PURLS) to explore visual-semantic alignment at both local and global scales. PURLS introduces a new prompting module and a novel partitioning module to generate aligned textual and visual representations across different levels. The former leverages a pre-trained GPT-3 to infer refined descriptions of the global and local (body-part-based and temporal-interval-based) movements from the original action labels. The latter employs an adaptive sampling strategy to group visual features from all body joint movements that are semantically relevant to a given description. Our approach is evaluated on various skeleton/language backbones and three large-scale datasets i.e. NTU-RGB+D 60 NTU-RGB+D 120 and a newly curated dataset Kinetics-skeleton 200. The results showcase the universality and superior performance of PURLS surpassing prior skeleton-based solutions and standard baselines from other domains. The source codes can be accessed at https://github.com/azzh1/PURLS.

SD2Event:Self-supervised Learning of Dynamic Detectors and Contextual Descriptors for Event Cameras
Yuan Gao, Yuqing Zhu, Xinjun Li, Yimin Du, Tianzhu Zhang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 3055-3064
Event cameras offer many advantages over traditional frame-based cameras such as high dynamic range and low latency. Therefore event cameras are widely applied in diverse computer vision applications where event-based keypoint detection is a fundamental task. However achieving robust event-based keypoint detection remains challenging because the ground truth of event keypoints is difficult to obtain descriptors extracted by CNN usually lack discriminative ability in the presence of intense noise and fixed keypoint detectors are limited in detecting varied keypoint patterns. To address these challenges a novel event-based keypoint detection method is proposed by learning dynamic detectors and contextual descriptors in a self-supervised manner (SD2Event) including a contextual feature descriptor learning (CFDL) module and a dynamic keypoint detector learning (DKDL) module. The proposed SD2Event enjoys several merits. First the proposed CFDL module can model long-range contexts efficiently and effectively. Second the DKDL module generates dynamic keypoint detectors which can detect keypoints with diverse patterns across various event streams. Third the proposed self-supervised signals can guide the model's adaptation to event data. Extensive experimental results on three challenging benchmarks show that our proposed method significantly outperforms stateof-the-art event-based keypoint detection methods.

Composing Object Relations and Attributes for Image-Text Matching
Khoi Pham, Chuong Huynh, Ser-Nam Lim, Abhinav Shrivastava; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 14354-14363
We study the visual semantic embedding problem for image-text matching. Most exi

sting work utilizes a tailored cross-attention mechanism to perform local alignm
ent across the two image and text modalities. This is computationally expensive
even though it is more powerful than the unimodal dual-encoder approach. This wo
rk introduces a dual-encoder image-text matching model leveraging a scene graph
to represent captions with nodes for objects and attributes interconnected by re
lational edges. Utilizing a graph attention network our model efficiently encode
s object-attribute and object-object semantic relations resulting in a robust an
d fast-performing system. Representing caption as a scene graph offers the abili
ty to utilize the strong relational inductive bias of graph neural networks to l
earn object-attribute and object-object relations effectively. To train the mode
l we propose losses that align the image and caption both at the holistic level
(image-caption) and the local level (image-object entity) which we show is key t
o the success of the model. Our model is termed Composition model for Object Rel
ations and Attributes CORA. Experimental results on two prominent image-text ret
rieval benchmarks Flickr30K and MS-COCO demonstrate that CORA outperforms existi
ng state-of-the-art computationally expensive cross-attention methods regarding
recall score while achieving fast computation speed of the dual encoder. Our cod
e is available at https://github.com/vkhoi/cora_cvpr24

Spectral and Polarization Vision: Spectro-polarimetric Real-world Dataset
Yujin Jeon, Eunsue Choi, Youngchan Kim, Yunseong Moon, Khalid Omer, Felix Heide, Seung-Hwan Baek; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 22098-22108
Image datasets are essential not only in validating existing methods in computer vision but also in developing new methods. Many image datasets exist consisting of trichromatic intensity images taken with RGB cameras which are designed to replicate human vision. However polarization and spectrum the wave properties of light that animals in harsh environments and with limited brain capacity often rely on remain underrepresented in existing datasets. Although there are previous spectro-polarimetric datasets they have insufficient object diversity limited illumination conditions linear-only polarization data and inadequate image count. Here we introduce two spectro-polarimetric datasets consisting of trichromatic Stokes images and hyperspectral Stokes images. These datasets encompass both linear and circular polarization; they introduce multiple spectral channels; and they feature a broad selection of real-world scenes. With our dataset in hand we analyze the spectro-polarimetric image statistics develop efficient representations of such high-dimensional data and evaluate spectral dependency of shape-from-polarization methods. As such the proposed dataset promises a foundation for data-driven spectro-polarimetric imaging and vision research.

Learning by Correction: Efficient Tuning Task for Zero-Shot Generative Vision-Language Reasoning
Rongjie Li, Yu Wu, Xuming He; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 13428-13437
Generative vision-language models (VLMs) have shown impressive performance in zero-shot vision-language tasks like image captioning and visual question answering.However improving their zero-shot reasoning typically requires second-stage instruction tuning which relies heavily on human-labeled or large language model-generated annotation incurring high labeling costs. To tackle this challenge we introduce Image-Conditioned Caption Correction (ICCC) a novel pre-training task designed to enhance VLMs' zero-shot performance without the need for labeled task-aware data. The ICCC task compels VLMs to rectify mismatches between visual and language concepts thereby enhancing instruction following and text generation conditioned on visual inputs. Leveraging language structure and a lightweight dependency parser we construct data samples of ICCC task from image-text datasets with low labeling and computation costs. Experimental results on BLIP-2 and InstructBLIP demonstrate significant improvements in zero-shot image-text generation-based VL tasks through ICCC instruction tuning.
****
Supervised Anomaly Detection for Complex Industrial Images
Aimira Baitieva, David Hurych, Victor Besnier, Olivier Bernard; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 17754-17762
Automating visual inspection in industrial production lines is essential for increasing product quality across various industries. Anomaly detection (AD) methods serve as robust tools for this purpose. However existing public datasets prima

rily consist of images without anomalies limiting the practical application of AD methods in production settings. To address this challenge we present (1) the Valeo Anomaly Dataset (VAD) a novel real-world industrial dataset comprising 5000 images including 2000 instances of challenging real defects across more than 20 subclasses. Acknowledging that traditional AD methods struggle with this dataset we introduce (2) Segmentation-based Anomaly Detector (SegAD). First SegAD leverages anomaly maps as well as segmentation maps to compute local statistics. Next SegAD uses these statistics and an optional supervised classifier score as input features for a Boosted Random Forest (BRF) classifier yielding the final anomaly score. Our SegAD achieves state-of-the-art performance on both VAD (+2.1% AUROC) and the VisA dataset (+0.4% AUROC). The code and the models are publicly available.

Open3DSG: Open-Vocabulary 3D Scene Graphs from Point Clouds with Queryable Objects and Open-Set Relationships
Sebastian Koch, Narunas Vaskevicius, Mirco Colosi, Pedro Hermosilla, Timo Ropinski; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 14183-14193
Current approaches for 3D scene graph prediction rely on labeled datasets to train models for a fixed set of known object classes and relationship categories. We present Open3DSG an alternative approach to learn 3D scene graph prediction in an open world without requiring labeled scene graph data. We co-embed the features from a 3D scene graph prediction backbone with the feature space of powerful open world 2D vision language foundation models. This enables us to predict 3D scene graphs from 3D point clouds in a zero-shot manner by querying object classes from an open vocabulary and predicting the inter-object relationships from a grounded LLM with scene graph features and queried object classes as context. Open3DSG is the first 3D point cloud method to predict not only explicit open-vocabulary object classes but also open-set relationships that are not limited to a predefined label set making it possible to express rare as well as specific objects and relationships in the predicted 3D scene graph. Our experiments show that Open3DSG is effective at predicting arbitrary object classes as well as their complex inter-object relationships describing spatial supportive semantic and comparative relationships.

SURE: SUrvey REcipes for building reliable and robust deep networks
Yuting Li, Yingyi Chen, Xuanlong Yu, Dexiong Chen, Xi Shen; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 17500-17510
In this paper we revisit techniques for uncertainty estimation within deep neural networks and consolidate a suite of techniques to enhance their reliability. Our investigation reveals that an integrated application of diverse techniques--spanning model regularization classifier and optimization--substantially improves the accuracy of uncertainty predictions in image classification tasks. The synergistic effect of these techniques culminates in our novel SURE approach. We rigorously evaluate SURE against the benchmark of failure prediction a critical testbed for uncertainty estimation efficacy. Our results showcase a consistently better performance than models that individually deploy each technique across various datasets and model architectures. When applied to real-world challenges such as data corruption label noise and long-tailed class distribution SURE exhibits remarkable robustness delivering results that are superior or on par with current state-of-the-art specialized methods. Particularly on Animal-10N and Food-101N for learning with noisy labels SURE achieves state-of-the-art performance without any task-specific adjustments. This work not only sets a new benchmark for robust uncertainty estimation but also paves the way for its application in diverse real-world scenarios where reliability is paramount. Our code is available at https://yutingli0606.github.io/SURE/.

PolarRec: Improving Radio Interferometric Data Reconstruction Using Polar Coordinates

Ruoqi Wang, Zhuoyang Chen, Jiayi Zhu, Qiong Luo, Feng Wang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 12841-12850

In radio astronomy visibility data which are measurements of wave signals from radio telescopes are transformed into images for observation of distant celestial objects. However these resultant images usually contain both real sources and artifacts due to signal sparsity and other factors. One way to obtain cleaner images is to reconstruct samples into dense forms before imaging. Unfortunately existing reconstruction methods often miss some components of visibility in frequency domain so blurred object edges and persistent artifacts remain in the images. Furthermore the computation overhead is high on irregular visibility samples due to the data skew. To address these problems we propose PolarRec a transformer-encoder-conditioned reconstruction pipeline with visibility samples converted into the polar coordinate system. This coordinate system matches the way in which radio telescopes observe a celestial area as the Earth rotates. As a result visibility samples distribute in the polar system more uniformly than in the Cartesian space. Therefore we propose to use radial distance in the loss function to help reconstruct complete visibility effectively. Also we group visibility samples by their polar angles and propose a group-based encoding scheme to improve the efficiency. Our experiments demonstrate that PolarRec markedly improves imaging results by faithfully reconstructing all frequency components in the visibility domain while significantly reducing the computation cost in visibility data encoding. The code is available at https://github.com/RapidsAtHKUST/PolarRec.

Affine Equivariant Networks Based on Differential Invariants

Yikang Li, Yeqing Qiu, Yuxuan Chen, Lingshen He, Zhouchen Lin; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 5546-5556

Convolutional neural networks benefit from translation equivariance achieving tremendous success. Equivariant networks further extend this property to other transformation groups. However most existing methods require discretization or sampling of groups leading to increased model sizes for larger groups such as the affine group. In this paper we build affine equivariant networks based on differential invariants from the viewpoint of symmetric PDEs without discretizing or sampling the group. To address the division-by-zero issue arising from fractional differential invariants of the affine group we construct a new kind of affine invariants by normalizing polynomial relative differential invariants to replace classical differential invariants. For further flexibility we design an equivariant layer which can be directly integrated into convolutional networks of various architectures. Moreover our framework for the affine group is also applicable to its continuous subgroups. We implement equivariant networks for the scale group the rotation-scale group and the affine group. Numerical experiments demonstrate the outstanding performance of our framework across classification tasks involving transformations of these groups. Remarkably under the out-of-distribution setting our model achieves a 3.37% improvement in accuracy over the main counterpart affConv on the affNIST dataset.

Selectively Informative Description can Reduce Undesired Embedding Entanglements in Text-to-Image Personalization

Jimyeong Kim, Jungwon Park, Wonjong Rhee; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 8312-8322

In text-to-image personalization a timely and crucial challenge is the tendency of generated images overfitting to the biases present in the reference images. We initiate our study with a comprehensive categorization of the biases into background nearby-object tied-object substance (in style re-contextualization) and pose biases. These biases manifest in the generated images due to their entanglement into the subject embedding. This undesired embedding entanglement not only results in the reflection of biases from the reference images into the generated images but also notably diminishes the alignment of the generated images with the given generation prompt. To address this challenge we propose SID (Selectively

Informative Description) a text description strategy that deviates from the prevalent approach of only characterizing the subject's class identification. SID is generated utilizing multimodal GPT-4 and can be seamlessly integrated into optimization-based models. We present comprehensive experimental results along with analyses of cross-attention maps subject-alignment non-subject-disentanglement and text-alignment.

Summarize the Past to Predict the Future: Natural Language Descriptions of Context Boost Multimodal Object Interaction Anticipation
Razvan-George Pasca, Alexey Gavryushin, Muhammad Hamza, Yen-Ling Kuo, Kaichun Mo, Luc Van Gool, Otmar Hilliges, Xi Wang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 18286-18296
We study object interaction anticipation in egocentric videos. This task requires an understanding of the spatio-temporal context formed by past actions on objects coined "action context". We propose TransFusion a multimodal transformer-based architecture for short-term object interaction anticipation. Our method exploits the representational power of language by summarizing the action context textually after leveraging pre-trained vision-language foundation models to extract the action context from past video frames. The summarized action context and the last observed video frame are processed by the multimodal fusion module to forecast the next object interaction. Experiments on the Ego4D next active object interaction dataset show the effectiveness of our multimodal fusion model and highlight the benefits of using the power of foundation models and language-based context summaries in a task where vision may appear to suffice. Our novel approach outperforms all state-of-the-art methods on both versions of the Ego4D dataset.
****
Transfer CLIP for Generalizable Image Denoising
Jun Cheng, Dong Liang, Shan Tan; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 25974-25984
Image denoising is a fundamental task in computer vision. While prevailing deep learning-based supervised and self-supervised methods have excelled in eliminating in-distribution noise their susceptibility to out-of-distribution (OOD) noise remains a significant challenge. The recent emergence of contrastive language-image pre-training (CLIP) model has showcased exceptional capabilities in open-world image recognition and segmentation. Yet the potential for leveraging CLIP to enhance the robustness of low-level tasks remains largely unexplored. This paper uncovers that certain dense features extracted from the frozen ResNet image encoder of CLIP exhibit distortion-invariant and content-related properties which are highly desirable for generalizable denoising. Leveraging these properties we devise an asymmetrical encoder-decoder denoising network which incorporates dense features including the noisy image and its multi-scale features from the frozen ResNet encoder of CLIP into a learnable image decoder to achieve generalizable denoising. The progressive feature augmentation strategy is further proposed to mitigate feature overfitting and improve the robustness of the learnable decoder. Extensive experiments and comparisons conducted across diverse OOD noises including synthetic noise real-world sRGB noise and low-dose CT image noise demonstrate the superior generalization ability of our method.

Smooth Diffusion: Crafting Smooth Latent Spaces in Diffusion Models
Jiayi Guo, Xingqian Xu, Yifan Pu, Zanlin Ni, Chaofei Wang, Manushree Vasu, Shiji Song, Gao Huang, Humphrey Shi; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 7548-7558
Recently diffusion models have made remarkable progress in text-to-image (T2I) generation synthesizing images with high fidelity and diverse contents. Despite this advancement latent space smoothness within diffusion models remains largely unexplored. Smooth latent spaces ensure that a perturbation on an input latent corresponds to a steady change in the output image. This property proves beneficial in downstream tasks including image interpolation inversion and editing. In this work we expose the non-smoothness of diffusion latent spaces by observing no

ticeable visual fluctuations resulting from minor latent variations. To tackle this issue we propose Smooth Diffusion a new category of diffusion models that can be simultaneously high-performing and smooth. Specifically we introduce Step-wise Variation Regularization to enforce the proportion between the variations of an arbitrary input latent and that of the output image is a constant at any diffusion training step. In addition we devise an interpolation standard deviation (ISTD) metric to effectively assess the latent space smoothness of a diffusion model. Extensive quantitative and qualitative experiments demonstrate that Smooth Diffusion stands out as a more desirable solution not only in T2I generation but also across various downstream tasks. Smooth Diffusion is implemented as a plug-and-play Smooth-LoRA to work with various community models. Code is available at https://github.com/SHI-Labs/Smooth-Diffusion.

Towards CLIP-driven Language-free 3D Visual Grounding via 2D-3D Relational Enhancement and Consistency
Yuqi Zhang, Han Luo, Yinjie Lei; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 13063-13072
3D visual grounding plays a crucial role in scene understanding with extensive applications in AR/VR. Despite the significant progress made in recent methods the requirement of dense textual descriptions for each individual object which is time-consuming and costly hinders their scalability. To mitigate reliance on text annotations during training researchers have explored language-free training paradigms in the 2D field via explicit text generation or implicit feature substitution. Nevertheless unlike 2D images the complexity of spatial relations in 3D coupled with the absence of robust 3D visual language pre-trained models makes it challenging to directly transfer previous strategies. To tackle the above issues in this paper we introduce a language-free training framework for 3D visual grounding. By utilizing the visual-language joint embedding in 2D large cross-modality model as a bridge we can expediently produce the pseudo-language features by leveraging the features of 2D images which are equivalent to that of real textual descriptions. We further develop a relation injection scheme with a Neighboring Relation-aware Modeling module and a Cross-modality Relation Consistency module aiming to enhance and preserve the complex relationships between the 2D and 3D embedding space. Extensive experiments demonstrate that our proposed language-free 3D visual grounding approach can obtain promising performance across three widely used datasets --ScanRefer Nr3D and Sr3D. Our codes are available at https://github.com/xibi777/3DLFVG

Optimal Transport Aggregation for Visual Place Recognition
Sergio Izquierdo, Javier Civera; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 17658-17668
The task of Visual Place Recognition (VPR) aims to match a query image against references from an extensive database of images from different places relying solely on visual cues. State-of-the-art pipelines focus on the aggregation of features extracted from a deep backbone in order to form a global descriptor for each image. In this context we introduce SALAD (Sinkhorn Algorithm for Locally Aggregated Descriptors) which reformulates NetVLAD's soft-assignment of local features to clusters as an optimal transport problem. In SALAD we consider both feature-to-cluster and cluster-to-feature relations and we also introduce a dustbin cluster designed to selectively discard features deemed non-informative enhancing the overall descriptor quality. Additionally we leverage and fine-tune DINOv2 as a backbone which provides enhanced description power for the local features and dramatically reduces the required training time. As a result our single-stage method not only surpasses single-stage baselines in public VPR datasets but also surpasses two-stage methods that add a re-ranking with significantly higher cost.

FlowIE: Efficient Image Enhancement via Rectified Flow
Yixuan Zhu, Wenliang Zhao, Ao Li, Yansong Tang, Jie Zhou, Jiwen Lu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 13-22

Image enhancement holds extensive applications in real-world scenarios due to complex environments and limitations of imaging devices. Conventional methods are often constrained by their tailored models resulting in diminished robustness when confronted with challenging degradation conditions. In response we propose FlowIE a simple yet highly effective flow-based image enhancement framework that estimates straight-line paths from an elementary distribution to high-quality images. Unlike previous diffusion-based methods that suffer from long-time inference FlowIE constructs a linear many-to-one transport mapping via conditioned rectified flow. The rectification straightens the trajectories of probability transfer accelerating inference by an order of magnitude. This design enables our FlowIE to fully exploit rich knowledge in the pre-trained diffusion model rendering it well-suited for various real-world applications. Moreover we devise a faster inference algorithm inspired by Lagrange's Mean Value Theorem harnessing midpoint tangent direction to optimize path estimation ultimately yielding visually superior results. Thanks to these designs our FlowIE adeptly manages a diverse range of enhancement tasks within a concise sequence of fewer than 5 steps. Our contributions are rigorously validated through comprehensive experiments on synthetic and real-world datasets unveiling the compelling efficacy and efficiency of our proposed FlowIE.

Aligning and Prompting Everything All at Once for Universal Visual Perception

Yunhang Shen, Chaoyou Fu, Peixian Chen, Mengdan Zhang, Ke Li, Xing Sun, Yunsheng Wu, Shaohui Lin, Rongrong Ji; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 13193-13203

Vision foundation models have been explored recently to build general-purpose vision systems. However predominant paradigms driven by casting instance-level tasks as an object-word alignment bring heavy cross-modality interaction which is not effective in prompting object detection and visual grounding. Another line of work that focuses on pixel-level tasks often encounters a large annotation gap of things and stuff and suffers from mutual interference between foreground-object and background-class segmentation. In stark contrast to the prevailing methods we present APE a universal visual perception model for aligning and prompting everything all at once in an image to perform diverse tasks i.e. detection segmentation and grounding as an instance-level sentence-object matching paradigm. Specifically APE advances the convergence of detection and grounding by reformulating language-guided grounding as open-vocabulary detection which efficiently scales up model prompting to thousands of category vocabularies and region descriptions while maintaining the effectiveness of cross-modality fusion. To bridge the granularity gap of different pixel-level tasks APE equalizes semantic and panoptic segmentation to proxy instance learning by considering any isolated regions as individual instances. APE aligns vision and language representation on broad data with natural and challenging characteristics all at once without task-specific fine-tuning. The extensive experiments on over 160 datasets demonstrate that with only one-suit of weights APE outperforms (or is on par with) the state-of-the-art models proving that an effective yet universal perception for anything aligning and prompting is indeed feasible. Codes and trained models are released at https://github.com/shenyunhang/APE.

Correlation-Decoupled Knowledge Distillation for Multimodal Sentiment Analysis with Incomplete Modalities

Mingcheng Li, Dingkang Yang, Xiao Zhao, Shuaibing Wang, Yan Wang, Kun Yang, Mingyang Sun, Dongliang Kou, Ziyun Qian, Lihua Zhang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 12458-12468

Multimodal sentiment analysis (MSA) aims to understand human sentiment through multimodal data. Most MSA efforts are based on the assumption of modality completeness. However in real-world applications some practical factors cause uncertain modality missingness which drastically degrades the model's performance. To this end we propose a Correlation-decoupled Knowledge Distillation (CorrKD) framework for the MSA task under uncertain missing modalities. Specifically we present

a sample-level contrastive distillation mechanism that transfers comprehensive knowledge containing cross-sample correlations to reconstruct missing semantics. Moreover a category-guided prototype distillation mechanism is introduced to capture cross-category correlations using category prototypes to align feature distributions and generate favorable joint representations. Eventually we design a response-disentangled consistency distillation strategy to optimize the sentiment decision boundaries of the student network through response disentanglement and mutual information maximization. Comprehensive experiments on three datasets indicate that our framework can achieve favorable improvements compared with several baselines.

Revisiting Adversarial Training at Scale
Zeyu Wang, Xianhang Li, Hongru Zhu, Cihang Xie; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 24675-24685
The machine learning community has witnessed a drastic change in the training pipeline pivoted by those "foundation models" with unprecedented scales. However the field of adversarial training is lagging behind predominantly centered around small model sizes like ResNet-50 and tiny and low-resolution datasets like CIFAR-10. To bridge this transformation gap this paper provides a modern re-examination with adversarial training investigating its potential benefits when applied at scale. Additionally we introduce an efficient and effective training strategy to enable adversarial training with giant models and web-scale data at an affordable computing cost. We denote this newly introduced framework as AdvXL. Empirical results demonstrate that AdvXL establishes new state-of-the-art robust accuracy records under AutoAttack on ImageNet-1K. For example by training on DataComp-1B dataset our AdvXL empowers a vanilla ViT-g model to substantially surpass the previous records of l_ infinity - l_ 2 - and l_ 1 -robust accuracy by margins of 11.4% 14.2% and 12.9% respectively. This achievement posits AdvXL as a pioneering approach charting a new trajectory for the efficient training of robust visual representations at significantly larger scales. Our code is available at https://github.com/UCSC-VLAA/AdvXL.
****
Towards Fairness-Aware Adversarial Learning
Yanghao Zhang, Tianle Zhang, Ronghui Mu, Xiaowei Huang, Wenjie Ruan; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 24746-24755
Although adversarial training (AT) has proven effective in enhancing the model's robustness the recently revealed issue of fairness in robustness has not been well addressed i.e. the robust accuracy varies significantly among different categories. In this paper instead of uniformly evaluating the model's average class performance we delve into the issue of robust fairness by considering the worst-case distribution across various classes. We propose a novel learning paradigm named Fairness-Aware Adversarial Learning (FAAL). As a generalization of conventional AT we re-define the problem of adversarial training as a min-max-max framework to ensure both robustness and fairness of the trained model. Specifically by taking advantage of distributional robust optimization our method aims to find the worst distribution among different categories and the solution is guaranteed to obtain the upper bound performance with high probability. In particular FAAL can fine-tune an unfair robust model to be fair within only two epochs without compromising the overall clean and robust accuracies. Extensive experiments on various image datasets validate the superior performance and efficiency of the proposed FAAL compared to other state-of-the-art methods.
****
LoSh: Long-Short Text Joint Prediction Network for Referring Video Object Segmentation
Linfeng Yuan, Miaojing Shi, Zijie Yue, Qijun Chen; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 14001-14010
Referring video object segmentation (RVOS) aims to segment the target instance referred by a given text expression in a video clip. The text expression normally

contains sophisticated description of the instance's appearance action and relation with others. It is therefore rather difficult for a RVOS model to capture all these attributes correspondingly in the video; in fact the model often favours more on the action- and relation-related visual attributes of the instance. This can end up with partial or even incorrect mask prediction of the target instance. We tackle this problem by taking a subject-centric short text expression from the original long text expression. The short one retains only the appearance-related information of the target instance so that we can use it to focus the model's attention on the instance's appearance. We let the model make joint predictions using both long and short text expressions; and insert a long-short cross-attention module to interact the joint features and a long-short predictions intersection loss to regulate the joint predictions. Besides the improvement on the linguistic part we also introduce a forward-backward visual consistency loss which utilizes optical flows to warp visual features between the annotated frames and their temporal neighbors for consistency. We build our method on top of two state of the art pipelines. Extensive experiments on A2D-Sentences Refer-YouTube-VOS JHMDB-Sentences and Refer-DAVIS17 show impressive improvements of our method. Code is available here.

MirageRoom: 3D Scene Segmentation with 2D Pre-trained Models by Mirage Projection
Haowen Sun, Yueqi Duan, Juncheng Yan, Yifan Liu, Jiwen Lu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 20237-20246
Nowadays leveraging 2D images and pre-trained models to guide 3D point cloud feature representation has shown a remarkable potential to boost the performance of 3D fundamental models. While some works rely on additional data such as 2D real-world images and their corresponding camera poses recent studies target at using point cloud exclusively by designing 3D-to-2D projection. However in the indoor scene scenario existing 3D-to-2D projection strategies suffer from severe occlusions and incoherence which fail to contain sufficient information for fine-grained point cloud segmentation task. In this paper we argue that the crux of the matter resides in the basic premise of existing projection strategies that the medium is homogeneous thereby projection rays propagate along straight lines and behind objects are occluded by front ones. Inspired by the phenomenon of mirage where the occluded objects are exposed by distorted light rays due to heterogeneous medium refraction rate we propose MirageRoom by designing parametric mirage projection with heterogeneous medium to obtain series of projected images with various distorted degrees. We further develop a masked reprojection module across 2D and 3D latent space to bridge the gap between pre-trained 2D backbone and 3D point-wise features. Both quantitative and qualitative experimental results on S3DIS and ScanNet V2 demonstrate the effectiveness of our method.

In2SET: Intra-Inter Similarity Exploiting Transformer for Dual-Camera Compressive Hyperspectral Imaging
Xin Wang, Lizhi Wang, Xiangtian Ma, Maoqing Zhang, Lin Zhu, Hua Huang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 24881-24891
Dual-camera compressive hyperspectral imaging (DCCHI) offers the capability to reconstruct 3D hyperspectral image (HSI) by fusing compressive and panchromatic (PAN) image which has shown great potential for snapshot hyperspectral imaging in practice. In this paper we introduce a novel DCCHI reconstruction network intra-inter similarity exploiting Transformer (In2SET). Our key insight is to make full use of the PAN image to assist the reconstruction. To this end we propose to use the intra-similarity within the PAN image as a proxy for approximating the intra-similarity in the original HSI thereby offering an enhanced content prior for more accurate HSI reconstruction. Furthermore we propose to use the inter-similarity to align the features between HSI and PAN images thereby maintaining semantic consistency between the two modalities during the reconstruction process. By integrating In2SET into a PAN-guided deep unrolling (PGDU) framework our meth

od substantially enhances the spatial-spectral fidelity and detail of the recons
tructed images providing a more comprehensive and accurate depiction of the scen
e. Experiments conducted on both real and simulated datasets demonstrate that ou
r approach consistently outperforms existing state-of-the-art methods in terms o
f reconstruction quality and computational complexity. The code is available at
https://github.com/2JONAS/In2SET.

Dual Prototype Attention for Unsupervised Video Object Segmentation
Suhwan Cho, Minhyeok Lee, Seunghoon Lee, Dogyoon Lee, Heeseung Choi, Ig-Jae Kim,
 Sangyoun Lee; Proceedings of the IEEE/CVF Conference on Computer Vision and Pat
tern Recognition (CVPR), 2024, pp. 19238-19247
Unsupervised video object segmentation (VOS) aims to detect and segment the most
 salient object in videos. The primary techniques used in unsupervised VOS are 1
) the collaboration of appearance and motion information; and 2) temporal fusion
 between different frames. This paper proposes two novel prototype-based attenti
on mechanisms inter-modality attention (IMA) and inter-frame attention (IFA) to
incorporate these techniques via dense propagation across different modalities a
nd frames. IMA densely integrates context information from different modalities
based on a mutual refinement. IFA injects global context of a video to the query
 frame enabling a full utilization of useful properties from multiple frames. Ex
perimental results on public benchmark datasets demonstrate that our proposed ap
proach outperforms all existing methods by a substantial margin. The proposed tw
o components are also thoroughly validated via ablative study.

Look-Up Table Compression for Efficient Image Restoration
Yinglong Li, Jiacheng Li, Zhiwei Xiong; Proceedings of the IEEE/CVF Conference o
n Computer Vision and Pattern Recognition (CVPR), 2024, pp. 26016-26025
Look-Up Table (LUT) has recently gained increasing attention for restoring High-
Quality (HQ) images from Low-Quality (LQ) observations thanks to its high comput
ational efficiency achieved through a "space for time" strategy of caching learn
ed LQ-HQ pairs. However incorporating multiple LUTs for improved performance com
es at the cost of a rapidly growing storage size which is ultimately restricted
by the allocatable on-device cache size. In this work we propose a novel LUT com
pression framework to achieve a better trade-off between storage size and perfor
mance for LUT-based image restoration models. Based on the observation that most
 cached LQ image patches are distributed along the diagonal of a LUT we devise a
 Diagonal-First Compression (DFC) framework where diagonal LQ-HQ pairs are prese
rved and carefully re-indexed to maintain the representation capacity while non-
diagonal pairs are aggressively subsampled to save storage. Extensive experiment
s on representative image restoration tasks demonstrate that our DFC framework s
ignificantly reduces the storage size of LUT-based models (including our new des
ign) while maintaining their performance. For instance DFC saves up to 90% of st
orage at a negligible performance drop for x4 super-resolution. The source code
is available on GitHub: https://github.com/leenas233/DFC.

TextNeRF: A Novel Scene-Text Image Synthesis Method based on Neural Radiance Fie
lds
Jialei Cui, Jianwei Du, Wenzhuo Liu, Zhouhui Lian; Proceedings of the IEEE/CVF C
onference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 22272-222
81
Acquiring large-scale well-annotated datasets is essential for training robust s
cene text detectors yet the process is often resource-intensive and time-consumi
ng. While some efforts have been made to explore the synthesis of scene text ima
ges a notable gap remains between synthetic and authentic data. In this paper we
 introduce a novel method that utilizes Neural Radiance Fields (NeRF) to model r
eal-world scenes and emulate the data collection process by rendering images fro
m diverse camera perspectives enriching the variability and realism of the synth
esized data. A semi-supervised learning framework is proposed to categorize sema
ntic regions within 3D scenes ensuring consistent labeling of text regions acros
s various viewpoints. Our method also models the pose and view-dependent appeara

nce of text regions thereby offering precise control over camera poses and significantly improving the realism of text insertion and editing within scenes. Employing our technique on real-world scenes has led to the creation of a novel scene text image dataset. Compared to other existing benchmarks the proposed dataset is distinctive in providing not only standard annotations such as bounding boxes and transcriptions but also the information of 3D pose attributes for text regions enabling a more detailed evaluation of the robustness of text detection algorithms. Through extensive experiments we demonstrate the effectiveness of our proposed method in enhancing the performance of scene text detectors.

Dr.Hair: Reconstructing Scalp-Connected Hair Strands without Pre-Training via Differentiable Rendering of Line Segments
Yusuke Takimoto, Hikari Takehara, Hiroyuki Sato, Zihao Zhu, Bo Zheng; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 20601-20611
In the film and gaming industries achieving a realistic hair appearance typically involves the use of strands originating from the scalp. However reconstructing these strands from observed surface images of hair presents significant challenges. The difficulty in acquiring Ground Truth (GT) data has led state-of-the-art learning-based methods to rely on pre-training with manually prepared synthetic CG data. This process is not only labor-intensive and costly but also introduces complications due to the domain gap when compared to real-world data. In this study we propose an optimization-based approach that eliminates the need for pre-training. Our method represents hair strands as line segments growing from the scalp and optimizes them using a novel differentiable rendering algorithm. To robustly optimize a substantial number of slender explicit geometries we introduce 3D orientation estimation utilizing global optimization strand initialization based on Laplace's equation and reparameterization that leverages geometric connectivity and spatial proximity. Unlike existing optimization-based methods our method is capable of reconstructing internal hair flow in an absolute direction. Our method exhibits robust and accurate inverse rendering surpassing the quality of existing methods and significantly improving processing speed.

Improving Training Efficiency of Diffusion Models via Multi-Stage Framework and Tailored Multi-Decoder Architecture
Huijie Zhang, Yifu Lu, Ismail Alkhouri, Saiprasad Ravishankar, Dogyoon Song, Qing Qu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 7372-7381
Diffusion models emerging as powerful deep generative tools excel in various applications. They operate through a two-steps process: introducing noise into training samples and then employing a model to convert random noise into new samples (e.g. images). However their remarkable generative performance is hindered by slow training and sampling. This is due to the necessity of tracking extensive forward and reverse diffusion trajectories and employing a large model with numerous parameters across multiple timesteps (i.e. noise levels). To tackle these challenges we present a multi-stage framework inspired by our empirical findings. These observations indicate the advantages of employing distinct parameters tailored to each timestep while retaining universal parameters shared across all time steps. Our approach involves segmenting the time interval into multiple stages where we employ custom multi-decoder U-net architecture that blends time-dependent models with a universally shared encoder. Our framework enables the efficient distribution of computational resources and mitigates inter-stage interference which substantially improves training efficiency. Extensive numerical experiments affirm the effectiveness of our framework showcasing significant training and sampling efficiency enhancements on three state-of-the-art diffusion models including large-scale latent diffusion models. Furthermore our ablation studies illustrate the impact of two important components in our framework: (i) a novel timestep clustering algorithm for stage division and (ii) an innovative multi-decoder U-net architecture seamlessly integrating universal and customized hyperparameters.

****
In-Context Matting
He Guo, Zixuan Ye, Zhiguo Cao, Hao Lu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 3711-3720
We introduce in-context matting a novel task setting of image matting. Given a reference image of a certain foreground and guided priors such as points scribbles and masks in-context matting enables automatic alpha estimation on a batch of target images of the same foreground category without additional auxiliary input. This setting marries good performance in auxiliary input-based matting and ease of use in automatic matting which finds a good trade-off between customization and automation. To overcome the key challenge of accurate foreground matching we introduce IconMatting an in-context matting model built upon a pre-trained text-to-image diffusion model. Conditioned on inter- and intra-similarity matching IconMatting can make full use of reference context to generate accurate target alpha mattes. To benchmark the task we also introduce a novel testing dataset ICM-57 covering 57 groups of real-world images. Quantitative and qualitative results on the ICM-57 testing set show that IconMatting rivals the accuracy of trimap-based matting while retaining the automation level akin to automatic matting. Code is available at https://github.com/tiny-smart/in-context-matting.

Navigate Beyond Shortcuts: Debiased Learning Through the Lens of Neural Collapse
Yining Wang, Junjie Sun, Chenyue Wang, Mi Zhang, Min Yang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 12322-12331
Recent studies have noted an intriguing phenomenon termed Neural Collapse that is when the neural networks establish the right correlation between feature spaces and the training targets their last-layer features together with the classifier weights will collapse into a stable and symmetric structure. In this paper we extend the investigation of Neural Collapse to the biased datasets with imbalanced attributes. We observe that models will easily fall into the pitfall of shortcut learning and form a biased non-collapsed feature space at the early period of training which is hard to reverse and limits the generalization capability. To tackle the root cause of biased classification we follow the recent inspiration of prime training and propose an avoid-shortcut learning framework without additional training complexity. With well-designed shortcut primes based on Neural Collapse structure the models are encouraged to skip the pursuit of simple shortcuts and naturally capture the intrinsic correlations. Experimental results demonstrate that our method induces a better convergence property during training and achieves state-of-the-art generalization performance on both synthetic and real-world biased datasets.

A Subspace-Constrained Tyler's Estimator and its Applications to Structure from Motion
Feng Yu, Teng Zhang, Gilad Lerman; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 14575-14584
We present the subspace-constrained Tyler's estimator (STE) designed for recovering a low-dimensional subspace within a dataset that may be highly corrupted with outliers. STE is a fusion of the Tyler's M-estimator (TME) and a variant of the fast median subspace. Our theoretical analysis suggests that under a common inlier-outlier model STE can effectively recover the underlying subspace even when it contains a smaller fraction of inliers relative to other methods in the field of robust subspace recovery. We apply STE in the context of Structure from Motion (SfM) in two ways: for robust estimation of the fundamental matrix and for the removal of outlying cameras enhancing the robustness of the SfM pipeline. Numerical experiments confirm the state-of-the-art performance of our method in these applications. This research makes significant contributions to the field of robust subspace recovery particularly in the context of computer vision and 3D reconstruction.
****
FSC: Few-point Shape Completion
Xianzu Wu, Xianfeng Wu, Tianyu Luan, Yajing Bai, Zhongyuan Lai, Junsong Yuan; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 26077-26087
While previous studies have demonstrated successful 3D object shape completion with a sufficient number of points they often fail in scenarios when a few points e.g. tens of points are observed. Surprisingly via entropy analysis we find that even a few points e.g. 64 points could retain substantial information to help recover the 3D shape of the object. To address the challenge of shape completion with very sparse point clouds we then propose Few-point Shape Completion (FSC) model which contains a novel dual-branch feature extractor for handling extremely sparse inputs coupled with an extensive branch for maximal point utilization with a saliency branch for dynamic importance assignment. This model is further bolstered by a two-stage revision network that refines both the extracted features and the decoder output enhancing the detail and authenticity of the completed point cloud. Our experiments demonstrate the feasibility of recovering 3D shapes from a few points. The proposed Few-point Shape Completion (FSC) model outperforms previous methods on both few-point inputs and many-point inputs and shows good generalizability to different object categories.
****
CAD: Photorealistic 3D Generation via Adversarial Distillation
Ziyu Wan, Despoina Paschalidou, Ian Huang, Hongyu Liu, Bokui Shen, Xiaoyu Xiang, Jing Liao, Leonidas Guibas; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 10194-10207
The increased demand for 3D data in AR/VR robotics and gaming applications gave rise to powerful generative pipelines capable of synthesizing high-quality 3D objects. Most of these models rely on the Score Distillation Sampling (SDS) algorithm to optimize a 3D representation such that the rendered image maintains a high likelihood as evaluated by a pre-trained diffusion model. However this distillation process involves finding a correct mode in the high-dimensional and large-variance distribution produced by the diffusion model. This task is challenging and often leads to issues such as over-saturation over-smoothing and Janus-like artifacts in the 3D generation. In this paper we propose a novel learning paradigm for 3D synthesis that utilizes pre-trained diffusion models. Instead of focusing on mode-seeking our method directly models the distribution discrepancy between multi-view renderings and diffusion priors in an adversarial manner which unlocks the generation of high-fidelity and photorealistic 3D content conditioned on a single image and prompt. Moreover by harnessing the latent space of GANs and expressive diffusion model priors our method enables a wide variety of 3D applications including single-view reconstruction high diversity generation and continuous 3D interpolation in open domain. Our experiments demonstrate the superior

ity of our pipeline compared to previous works in terms of generation quality an
d diversity.

Enhancing Vision-Language Pre-training with Rich Supervisions
Yuan Gao, Kunyu Shi, Pengkai Zhu, Edouard Belval, Oren Nuriel, Srikar Appalaraju
, Shabnam Ghadar, Zhuowen Tu, Vijay Mahadevan, Stefano Soatto; Proceedings of th
e IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, p
p. 13480-13491
We propose Strongly Supervised pre-training with ScreenShots (S4) - a novel pre-
training paradigm for Vision-Language Models using data from large-scale web scr
eenshot rendering. Using web screenshots unlocks a treasure trove of visual and
textual cues that are not present in using image-text pairs. In S4 we leverage t
he inherent tree-structured hierarchy of HTML elements and the spatial localizat
ion to carefully design 10 pre-training tasks with large scale annotated data. T
hese tasks resemble downstream tasks across different domains and the annotation
s are cheap to obtain. We demonstrate that compared to current screenshot pre-tr
aining objectives our innovative pre-training method significantly enhances perf
ormance of image-to-text model in nine varied and popular downstream tasks - up
to 76.1% improvements on Table Detection and at least 1% on Widget Captioning.
****
T-VSL: Text-Guided Visual Sound Source Localization in Mixtures
Tanvir Mahmud, Yapeng Tian, Diana Marculescu; Proceedings of the IEEE/CVF Confer
ence on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 26742-26751
Visual sound source localization poses a significant challenge in identifying th
e semantic region of each sounding source within a video. Existing self-supervis
ed and weakly supervised source localization methods struggle to accurately dist
inguish the semantic regions of each sounding object particularly in multi-sourc
e mixtures. These methods often rely on audio-visual correspondence as guidance
which can lead to substantial performance drops in complex multi-source localiza
tion scenarios. The lack of access to individual source sounds in multi-source m
ixtures during training exacerbates the difficulty of learning effective audio-v
isual correspondence for localization. To address this limitation in this paper
we propose incorporating the text modality as an intermediate feature guide usin
g tri-modal joint embedding models (e.g. AudioCLIP) to disentangle the semantic
audio-visual source correspondence in multi-source mixtures. Our framework dubbe
d T-VSL begins by predicting the class of sounding entities in mixtures. Subsequ
ently the textual representation of each sounding source is employed as guidance
 to disentangle fine-grained audio-visual source correspondence from multi-sourc
e mixtures leveraging the tri-modal AudioCLIP embedding. This approach enables o
ur framework to handle a flexible number of sources and exhibits promising zero-
shot transferability to unseen classes during test time. Extensive experiments c
onducted on the MUSIC VGGSound and VGGSound-Instruments datasets demonstrate sig
nificant performance improvements over state-of-the-art methods. Code is release
d at https://github.com/enyac-group/T-VSL/tree/main.

DemoCaricature: Democratising Caricature Generation with a Rough Sketch
Dar-Yen Chen, Ayan Kumar Bhunia, Subhadeep Koley, Aneeshan Sain, Pinaki Nath Cho
wdhury, Yi-Zhe Song; Proceedings of the IEEE/CVF Conference on Computer Vision a
nd Pattern Recognition (CVPR), 2024, pp. 8629-8639
In this paper we democratise caricature generation empowering individuals to eff
ortlessly craft personalised caricatures with just a photo and a conceptual sket
ch. Our objective is to strike a delicate balance between abstraction and identi
ty while preserving the creativity and subjectivity inherent in a sketch. To ach
ieve this we present Explicit Rank-1 Model Editing alongside single-image person
alisation selectively applying nuanced edits to cross-attention layers for a sea
mless merge of identity and style. Additionally we propose Random Mask Reconstru
ction to enhance robustness directing the model to focus on distinctive identity
 and style features. Crucially our aim is not to replace artists but to eliminat
e accessibility barriers allowing enthusiasts to engage in the artistry.

CapHuman: Capture Your Moments in Parallel Universes
Chao Liang, Fan Ma, Linchao Zhu, Yingying Deng, Yi Yang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 6400-6409
We concentrate on a novel human-centric image synthesis task that is given only one reference facial photograph it is expected to generate specific individual images with diverse head positions poses facial expressions and illuminations in different contexts. To accomplish this goal we argue that our generative model should be capable of the following favorable characteristics: (1) a strong visual and semantic understanding of our world and human society for basic object and human image generation. (2) generalizable identity preservation ability. (3) flexible and fine-grained head control. Recently large pre-trained text-to-image diffusion models have shown remarkable results serving as a powerful generative foundation. As a basis we aim to unleash the above two capabilities of the pre-trained model. In this work we present a new framework named CapHuman. We embrace the "encode then learn to align" paradigm which enables generalizable identity preservation for new individuals without cumbersome tuning at inference. CapHuman encodes identity features and then learns to align them into the latent space. Moreover we introduce the 3D facial prior to equip our model with control over the human head in a flexible and 3D-consistent manner. Extensive qualitative and quantitative analyses demonstrate our CapHuman can produce well-identity-preserved photo-realistic and high-fidelity portraits with content-rich representations and various head renditions superior to established baselines. Code and checkpoint will be released at https://github.com/VamosC/CapHuman.

SDPose: Tokenized Pose Estimation via Circulation-Guide Self-Distillation
Sichen Chen, Yingyi Zhang, Siming Huang, Ran Yi, Ke Fan, Ruixin Zhang, Peixian Chen, Jun Wang, Shouhong Ding, Lizhuang Ma; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 1082-1090
Recently transformer-based methods have achieved state-of-the-art prediction quality on human pose estimation(HPE). Nonetheless most of these top-performing transformer-based models are too computation-consuming and storage-demanding to deploy on edge computing platforms. Those transformer-based models that require fewer resources are prone to under-fitting due to their smaller scale and thus perform notably worse than their larger counterparts. Given this conundrum we introduce SDPose a new self-distillation method for improving the performance of small transformer-based models. To mitigate the problem of under-fitting we design a transformer module named Multi-Cycled Transformer(MCT) based on multiple-cycled forwards to more fully exploit the potential of small model parameters. Further in order to prevent the additional inference compute-consuming brought by MCT we introduce a self-distillation scheme extracting the knowledge from the MCT module to a naive forward model. Specifically on the MSCOCO validation dataset SDPose-T obtains 69.7% mAP with 4.4M parameters and 1.8 GFLOPs. Furthermore SDPose-S-V2 obtains 73.5% mAP on the MSCOCO validation dataset with 6.2M parameters and 4.7 GFLOPs achieving a new state-of-the-art among predominant tiny neural network methods.

Authentic Hand Avatar from a Phone Scan via Universal Hand Model
Gyeongsik Moon, Weipeng Xu, Rohan Joshi, Chenglei Wu, Takaaki Shiratori; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 2029-2038
The authentic 3D hand avatar with every identifiable information such as hand shapes and textures is necessary for immersive experiences in AR/VR. In this paper we present a universal hand model (UHM) which 1) can universally represent high-fidelity 3D hand meshes of arbitrary identities (IDs) and 2) can be adapted to each person with a short phone scan for the authentic hand avatar. For effective universal hand modeling we perform tracking and modeling at the same time while previous 3D hand models perform them separately. The conventional separate pipeline suffers from the accumulated errors from the tracking stage which cannot be recovered in the modeling stage. On the other hand ours does not suffer from th

e accumulated errors while having a much more concise overall pipeline. We additionally introduce a novel image matching loss function to address a skin sliding during the tracking and modeling while existing works have not focused on it much. Finally using learned priors from our UHM we effectively adapt our UHM to each person's short phone scan for the authentic hand avatar.

VCoder: Versatile Vision Encoders for Multimodal Large Language Models
Jitesh Jain, Jianwei Yang, Humphrey Shi; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 27992-28002
Humans possess the remarkable skill of Visual Perception the ability to see and understand the seen helping them make sense of the visual world and in turn reason. Multimodal Large Language Models (MLLM) have recently achieved impressive performance on vision-language tasks ranging from visual question-answering and image captioning to visual reasoning and image generation. However when prompted to identify or count (perceive) the entities in a given image existing MLLM systems fail. Working towards developing an accurate MLLM system for perception and reasoning we propose using Versatile vision enCoders (VCoder) as perception eyes for Multimodal LLMs. We feed the VCoder with perception modalities such as segmentation or depth maps improving the MLLM's perception abilities. Secondly we leverage the images from COCO and outputs from off-the-shelf vision perception models to create our COCO Segmentation Text (COST) dataset for training and evaluating MLLMs on the object perception task. Thirdly we introduce metrics to assess the object perception abilities in MLLMs on our COST dataset. Lastly we provide extensive experimental evidence proving the VCoder's improved object-level perception skills over existing Multimodal LLMs including GPT-4V. We open-source our dataset code and models to promote research.

Event-based Visible and Infrared Fusion via Multi-task Collaboration
Mengyue Geng, Lin Zhu, Lizhi Wang, Wei Zhang, Ruiqin Xiong, Yonghong Tian; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 26929-26939
Visible and Infrared image Fusion (VIF) offers a comprehensive scene description by combining thermal infrared images with the rich textures from visible cameras. However conventional VIF systems may capture over/under exposure or blurry images in extreme lighting and high dynamic motion scenarios leading to degraded fusion results. To address these problems we propose a novel Event-based Visible and Infrared Fusion (EVIF) system that employs a visible event camera as an alternative to traditional frame-based cameras for the VIF task. With extremely low latency and high dynamic range event cameras can effectively address blurriness and are robust against diverse luminous ranges. To produce high-quality fused images we develop a multi-task collaborative framework that simultaneously performs event-based visible texture reconstruction event-guided infrared image deblurring and visible-infrared fusion. Rather than independently learning these tasks our framework capitalizes on their synergy leveraging cross-task event enhancement for efficient deblurring and bi-level min-max mutual information optimization to achieve higher fusion quality. Experiments on both synthetic and real data show that EVIF achieves remarkable performance in dealing with extreme lighting conditions and high-dynamic scenes ensuring high-quality fused images across a broad range of practical scenarios.

Open-World Semantic Segmentation Including Class Similarity
Matteo Sodano, Federico Magistri, Lucas Nunes, Jens Behley, Cyrill Stachniss; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 3184-3194
Interpreting camera data is key for autonomously acting systems such as autonomous vehicles. Vision systems that operate in real-world environments must be able to understand their surroundings and need the ability to deal with novel situations. This paper tackles open-world semantic segmentation i.e. the variant of interpreting image data in which objects occur that have not been seen during training. We propose a novel approach that performs accurate closed-world semantic s

egmentation and at the same time can identify new categories without requiring any additional training data. Our approach additionally provides a similarity measure for every newly discovered class in an image to a known category which can be useful information in downstream tasks such as planning or mapping. Through extensive experiments we show that our model achieves state-of-the-art results on classes known from training data as well as for anomaly segmentation and can distinguish between different unknown classes.
****
RegionPLC: Regional Point-Language Contrastive Learning for Open-World 3D Scene Understanding
Jihan Yang, Runyu Ding, Weipeng Deng, Zhe Wang, Xiaojuan Qi; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 19823-19832
We propose a lightweight and scalable Regional Point-Language Contrastive learning framework namely RegionPLC for open-world 3D scene understanding aiming to identify and recognize open-set objects and categories. Specifically based on our empirical studies we introduce a 3D-aware SFusion strategy that fuses 3D vision-language pairs derived from multiple 2D foundation models yielding high-quality dense region-level language descriptions without human 3D annotations. Subsequently we devise a region-aware point-discriminative contrastive learning objective to enable robust and effective 3D learning from dense regional language supervision. We carry out extensive experiments on ScanNet ScanNet200 and nuScenes datasets and our model outperforms prior 3D open-world scene understanding approaches by an average of 17.2% and 9.1% for semantic and instance segmentation respectively while maintaining greater scalability and lower resource demands. Furthermore our method has the flexibility to be effortlessly integrated with language models to enable open-ended grounded 3D reasoning without extra task-specific training. Code will be released.
****
Adaptive VIO: Deep Visual-Inertial Odometry with Online Continual Learning
Youqi Pan, Wugen Zhou, Yingdian Cao, Hongbin Zha; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 18019-18028
Visual-inertial odometry (VIO) has demonstrated remarkable success due to its low-cost and complementary sensors. However existing VIO methods lack the generalization ability to adjust to different environments and sensor attributes. In this paper we propose Adaptive VIO a new monocular visual-inertial odometry that combines online continual learning with traditional nonlinear optimization. Adaptive VIO comprises two networks to predict visual correspondence and IMU bias. Unlike end-to-end approaches that use networks to fuse the features from two modalities (camera and IMU) and predict poses directly we combine neural networks with visual-inertial bundle adjustment in our VIO system. The optimized estimates will be fed back to the visual and IMU bias networks refining the networks in a self-supervised manner. Such a learning-optimization-combined framework and feedback mechanism enable the system to perform online continual learning. Experiments demonstrate that our Adaptive VIO manifests adaptive capability on EuRoC and TUM-VI datasets. The overall performance exceeds the currently known learning-based VIO methods and is comparable to the state-of-the-art optimization-based methods.
****
Towards Memorization-Free Diffusion Models
Chen Chen, Daochang Liu, Chang Xu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 8425-8434
Pretrained diffusion models and their outputs are widely accessible due to their exceptional capacity for synthesizing high-quality images and their open-source nature. The users however may face litigation risks owing to the models' tendency to memorize and regurgitate training data during inference. To address this we introduce Anti-Memorization Guidance (AMG) a novel framework employing three targeted guidance strategies for the main causes of memorization: image and caption duplication and highly specific user prompts. Consequently AMG ensures memori

zation-free outputs while maintaining high image quality and text alignment leveraging the synergy of its guidance methods each indispensable in its own right. AMG also features an innovative automatic detection system for potential memorization during each step of inference process allows selective application of guidance strategies minimally interfering with the original sampling process to preserve output utility. We applied AMG to pretrained Denoising Diffusion Probabilistic Models (DDPM) and Stable Diffusion across various generation tasks. The results demonstrate that AMG is the first approach to successfully eradicates all instances of memorization with no or marginal impacts on image quality and text-alignment as evidenced by FID and CLIP scores.

Generalized Large-Scale Data Condensation via Various Backbone and Statistical Matching
Shitong Shao, Zeyuan Yin, Muxin Zhou, Xindong Zhang, Zhiqiang Shen; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 16709-16718
The lightweight "local-match-global" matching introduced by SRe2L successfully creates a distilled dataset with comprehensive information on the full 224x224 ImageNet-1k. However this one-sided approach is limited to a particular backbone layer and statistics which limits the improvement of the generalization of a distilled dataset. We suggest that sufficient and various "local-match-global" matching are more precise and effective than a single one and has the ability to create a distilled dataset with richer information and better generalization. We call this perspective "generalized matching" and propose Generalized Various Backbone and Statistical Matching (G-VBSM) in this work which aims to create a synthetic dataset with densities ensuring consistency with the complete dataset across various backbones layers and statistics. As experimentally demonstrated G-VBSM is the first algorithm to obtain strong performance across both small-scale and large-scale datasets. Specifically G-VBSM achieves a performance of 38.7% on CIFAR-100 with 128-width ConvNet 47.6% on Tiny-ImageNet with ResNet18 and 31.4% on the full 224x224 ImageNet-1k with ResNet18 under images per class (IPC) 10 50 and 10 respectively. These results surpass all SOTA methods by margins of 3.9% 6.5% and 10.1% respectively.

Three Pillars Improving Vision Foundation Model Distillation for Lidar
Gilles Puy, Spyros Gidaris, Alexandre Boulch, Oriane Siméoni, Corentin Sautier, Patrick Pérez, Andrei Bursuc, Renaud Marlet; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 21519-21529
Self-supervised image backbones can be used to address complex 2D tasks (e.g. semantic segmentation object discovery) very efficiently and with little or no downstream supervision. Ideally 3D backbones for lidar should be able to inherit these properties after distillation of these powerful 2D features. The most recent methods for image-to-lidar distillation on autonomous driving data show promising results obtained thanks to distillation methods that keep improving. Yet we still notice a large performance gap when measuring by linear probing the quality of distilled vs fully supervised features. In this work instead of focusing only on the distillation method we study the effect of three pillars for distillation: the 3D backbone the pretrained 2D backbone and the pretraining 2D+3D dataset. In particular thanks to our scalable distillation method named ScaLR we show that scaling the 2D and 3D backbones and pretraining on diverse datasets leads to a substantial improvement of the feature quality. This allows us to significantly reduce the gap between the quality of distilled and fully-supervised 3D features and to improve the robustness of the pretrained backbones to domain gaps and perturbations.

On Train-Test Class Overlap and Detection for Image Retrieval
Chull Hwan Song, Jooyoung Yoon, Taebaek Hwang, Shunghyun Choi, Yeong Hyeon Gu, Yannis Avrithis; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 17375-17384
How important is it for training and evaluation sets to not have class overlap i

n image retrieval? We revisit Google Landmarks v2 clean the most popular training set by identifying and removing class overlap with Revisited Oxford and Paris the most popular training set. By comparing the original and the new RGLDv2-clean on a benchmark of reproduced state-of-the-art methods our findings are striking. Not only is there a dramatic drop in performance but it is inconsistent across methods changing the ranking. What does it take to focus on objects or interest and ignore background clutter when indexing? Do we need to analyze the evaluation set? Do we need to train an object detector and the representation separately? Do we need location supervision? We introduce Single-stage Detect-to-Retrieve (CiDeR) an end-to-end single-stage pipeline to detect objects of interest and extract a global image representation. We outperform previous state-of-the-art on both existing training sets and the new RGLDv2-clean.
****
AttriHuman-3D: Editable 3D Human Avatar Generation with Attribute Decomposition and Indexing
Fan Yang, Tianyi Chen, Xiaosheng He, Zhongang Cai, Lei Yang, Si Wu, Guosheng Lin; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 10596-10605
Editable 3D-aware generation which supports user-interacted editing has witnessed rapid development recently. However existing editable 3D GANs either fail to achieve high-accuracy local editing or suffer from huge computational costs. We propose AttriHuman-3D an editable 3D human generation model which address the aforementioned problems with attribute decomposition and indexing. The core idea of the proposed model is to generate all attributes (e.g. human body hair clothes and so on) in an overall attribute space with six feature planes which are then decomposed and manipulated with different attribute indexes. To precisely extract features of different attributes from the generated feature planes we propose a novel attribute indexing method as well as an orthogonal projection regularization to enhance the disentanglement. We also introduce a hyper-latent training strategy and an attribute-specific sampling strategy to avoid style entanglement and misleading punishment from the discriminator. Our method allows users to interactively edit selected attributes in the generated 3D human avatars while keeping others fixed. Both qualitative and quantitative experiments demonstrate that our model provides a strong disentanglement between different attributes allows fine-grained image editing and generates high-quality 3D human avatars.

IQ-VFI: Implicit Quadratic Motion Estimation for Video Frame Interpolation
Mengshun Hu, Kui Jiang, Zhihang Zhong, Zheng Wang, Yinqiang Zheng; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 6410-6419
Advanced video frame interpolation (VFI) algorithms approximate intermediate motions between two input frames to synthesize intermediate frame. However they struggle to handle complex scenarios with curvilinear motions since they overlook the latent acceleration information between the input frames. Moreover the supervision of predicted motions is tricky because ground-truth motions are not available. To this end we propose a novel framework for implicit quadratic video frame interpolation (IQ-VFI) which explores latent acceleration information and accurate intermediate motions via knowledge distillation. Specifically the proposed IQ-VFI consists of an implicit acceleration estimation network (IANet) and a VFI backbone the former fully leverages spatio-temporal information to explore latent acceleration priors between two input frames which is then used to progressively modulate linear motions from the latter into quadratic motions in coarse-to-fine manner. Furthermore to encourage both components to distill more acceleration and motion cues oriented towards VFI we propose a knowledge distillation strategy in which implicit acceleration distillation loss and implicit motion distillation loss are employed to adaptively guide latent acceleration priors and intermediate motions learning respectively. Extensive experiments show that our proposed IQ-VFI can achieve state-of-the-art performances on various benchmark datasets.

KeyPoint Relative Position Encoding for Face Recognition
Minchul Kim, Yiyang Su, Feng Liu, Anil Jain, Xiaoming Liu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 244-255
In this paper we address the challenge of making ViT models more robust to unseen affine transformations. Such robustness becomes useful in various recognition tasks such as face recognition when image alignment failures occur. We propose a novel method called KP-RPE which leverages key points (e.g.facial landmarks) to make ViT more resilient to scale translation and pose variations. We begin with the observation that Relative Position Encoding (RPE) is a good way to bring affine transform generalization to ViTs. RPE however can only inject the model with prior knowledge that nearby pixels are more important than far pixels. Keypoint RPE (KP-RPE) is an extension of this principle where the significance of pixels is not solely dictated by their proximity but also by their relative positions to specific keypoints within the image. By anchoring the significance of pixels around keypoints the model can more effectively retain spatial relationships even when those relationships are disrupted by affine transformations. We show the merit of KP-RPE in face and gait recognition. The experimental results demonstrate the effectiveness in improving face recognition performance from low-quality images particularly where alignment is prone to failure. Code and pre-trained models are available.

Hyper-MD: Mesh Denoising with Customized Parameters Aware of Noise Intensity and Geometric Characteristics
Xingtao Wang, Hongliang Wei, Xiaopeng Fan, Debin Zhao; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 4651-4660
Mesh denoising (MD) is a critical task in geometry processing as meshes from scanning or AIGC techniques are susceptible to noise contamination. The challenge of MD lies in the diverse nature of mesh facets in terms of geometric characteristics and noise distributions. Despite recent advancements in deep learning-based MD methods existing MD networks typically neglect the consideration of geometric characteristics and noise distributions. In this paper we propose Hyper-MD a hyper-network-based approach that addresses this limitation by dynamically customizing denoising parameters for each facet based on its noise intensity and geometric characteristics. Specifically Hyper-MD is composed of a hyper-network and an MD network. For each noisy facet the hyper-network takes two angles as input to customize parameters for the MD network. These two angles are specially defined to reveal the noise intensity and geometric characteristics of the current facet respectively. The MD network receives a facet patch as input and outputs the denoised normal using the customized parameters. Experimental results on synthetic and real-scanned meshes demonstrate that Hyper-MD outperforms state-of-the-art mesh denoising methods.

Learning Object State Changes in Videos: An Open-World Perspective
Zihui Xue, Kumar Ashutosh, Kristen Grauman; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 18493-18503
Object State Changes (OSCs) are pivotal for video understanding. While humans can effortlessly generalize OSC understanding from familiar to unknown objects current approaches are confined to a closed vocabulary. Addressing this gap we introduce a novel open-world formulation for the video OSC problem. The goal is to temporally localize the three stages of an OSC---the object's initial state its transitioning state and its end state---whether or not the object has been observed during training. Towards this end we develop VidOSC a holistic learning approach that: (1) leverages text and vision-language models for supervisory signals to obviate manually labeling OSC training data and (2) abstracts fine-grained shared state representations from objects to enhance generalization. Furthermore we present HowToChange the first open-world benchmark for video OSC localization which offers an order of magnitude increase in the label space and annotation volume compared to the best existing benchmark. Experimental results demonstrate t

he efficacy of our approach in both traditional closed-world and open-world scenarios.

Beyond First-Order Tweedie: Solving Inverse Problems using Latent Diffusion
Litu Rout, Yujia Chen, Abhishek Kumar, Constantine Caramanis, Sanjay Shakkottai, Wen-Sheng Chu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 9472-9481
Sampling from the posterior distribution in latent diffusion models for inverse problems is computationally challenging. Existing methods often rely on Tweedie's first-order moments that tend to induce biased results. Second-order approximations are computationally prohibitive making standard reverse diffusion processes intractable for posterior sampling. This paper presents Second-order Tweedie sampler from Surrogate Loss (STSL) a novel sampler offering efficiency comparable to first-order Tweedie while enabling tractable reverse processes using second-order approximation. Theoretical results reveal that our approach utilizing for the trace of the Hessian with only O(1) compute establishes a lower bound through a surrogate loss and enables a tractable reverse process. We show STSL outperforms SoTA solvers PSLD and P2L by reducing neural function evaluations by 4X and 8X respectively while enhancing sampling quality on FFHQ ImageNet and COCO benchmarks. Moreover STSL extends to text guided image editing and mitigates residual distortions in corrupted images. To our best knowledge this is the first work to offer an efficient second order approximation for solving inverse problems using latent diffusion and editing real world images with corruptions.

Rethinking the Objectives of Vector-Quantized Tokenizers for Image Synthesis
Yuchao Gu, Xintao Wang, Yixiao Ge, Ying Shan, Mike Zheng Shou; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 7631-7640
Vector-Quantized (VQ-based) generative models usually consist of two basic components i.e. VQ tokenizers and generative transformers. Prior research focuses on improving the reconstruction fidelity of VQ tokenizers but rarely examines how the improvement in reconstruction affects the generation ability of generative transformers. In this paper we find that improving the reconstruction fidelity of VQ tokenizers does not necessarily improve the generation. Instead learning to compress semantic features within VQ tokenizers significantly improves generative transformers' ability to capture textures and structures. We thus highlight two competing objectives of VQ tokenizers for image synthesis: semantic compression and details preservation. Different from previous work that prioritizes better details preservation we propose Semantic-Quantized GAN (SeQ-GAN) with two learning phases to balance the two objectives. In the first phase we propose a semantic-enhanced perceptual loss for better semantic compression. In the second phase we fix the encoder and codebook but finetune the decoder to achieve better details preservation. Our proposed SeQ-GAN significantly improves VQ-based generative models for both unconditional and conditional image generation. Specifically SeQ-GAN achieves a Frechet Inception Distance (FID) of 6.25 and Inception Score (IS) of 140.9 on 256x256 ImageNet generation a remarkable improvement over VIT-VQGAN which obtains 11.2 FID and 97.2 IS.

ShapeWalk: Compositional Shape Editing Through Language-Guided Chains
Habib Slim, Mohamed Elhoseiny; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 22574-22583
Editing 3D shapes through natural language instructions is a challenging task that requires the comprehension of both language semantics and fine-grained geometric details. To bridge this gap we introduce ShapeWalk a carefully designed synthetic dataset designed to advance the field of language-guided shape editing. The dataset consists of 158K unique shapes connected through 26K edit chains with an average length of 14 chained shapes. Each consecutive pair of shapes is associated with precise language instructions describing the applied edits. We synthesize edit chains by reconstructing and interpolating shapes sampled from a realistic CAD-designed 3D dataset in the parameter space of the GeoCode shape program

. We leverage rule-based methods and language models to generate accurate and re
alistic natural language prompts corresponding to each edit. To illustrate the p
racticality of our contribution we train neural editor modules in the latent spa
ce of shape autoencoders and demonstrate the ability of our dataset to enable a
variety of language-guided shape edits. Finally we introduce multi-step editing
metrics to benchmark the capacity of our models to perform recursive shape edits
. We hope that our work will enable further study of compositional language-guid
ed shape editing and finds application in 3D CAD design and interactive modeling
.

MESA: Matching Everything by Segmenting Anything
Yesheng Zhang, Xu Zhao; Proceedings of the IEEE/CVF Conference on Computer Visio
n and Pattern Recognition (CVPR), 2024, pp. 20217-20226
Feature matching is a crucial task in the field of computer vision which involve
s finding correspondences between images. Previous studies achieve remarkable pe
rformance using learning-based feature comparison. However the pervasive presenc
e of matching redundancy between images gives rise to unnecessary and error-pron
e computations in these methods imposing limitations on their accuracy. To addre
ss this issue we propose MESA a novel approach to establish precise area (or reg
ion) matches for efficient matching redundancy reduction. MESA first leverages t
he advanced image understanding capability of SAM a state-of-the-art foundation
model for image segmentation to obtain image areas with implicit semantic. Then
a multi-relational graph is proposed to model the spatial structure of these are
as and construct their scale hierarchy. Based on graphical models derived from t
he graph the area matching is reformulated as an energy minimization task and ef
fectively resolved. Extensive experiments demonstrate that MESA yields substanti
al precision improvement for multiple point matchers in indoor and outdoor downs
tream tasks e.g. +13.61% for DKM in indoor pose estimation.

Learning Degradation-Independent Representations for Camera ISP Pipelines
Yanhui Guo, Fangzhou Luo, Xiaolin Wu; Proceedings of the IEEE/CVF Conference on
Computer Vision and Pattern Recognition (CVPR), 2024, pp. 25774-25783
Image signal processing (ISP) pipeline plays a fundamental role in digital camer
as which converts raw Bayer sensor data to RGB images. However ISP-generated ima
ges usually suffer from imperfections due to the compounded degradations that st
em from sensor noises demosaicing noises compression artifacts and possibly adve
rse effects of erroneous ISP hyperparameter settings such as ISO and gamma value
s. In a general sense these ISP imperfections can be considered as degradations.
The highly complex mechanisms of ISP degradations some of which are even unknow
n pose great challenges to the generalization capability of deep neural networks
(DNN) for image restoration and to their adaptability to downstream tasks. To t
ackle the issues we propose a novel DNN approach to learn degradation-independen
t representations (DiR) through the refinement of a self-supervised learned base
line representation. The proposed DiR learning technique has remarkable domain g
eneralization capability and consequently it outperforms state-of-the-art method
s across various downstream tasks including blind image restoration object detec
tion and instance segmentation as verified in our experiments.

Continuous Pose for Monocular Cameras in Neural Implicit Representation
Qi Ma, Danda Pani Paudel, Ajad Chhatkuli, Luc Van Gool; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 5291-5301
In this paper we showcase the effectiveness of optimizing monocular camera poses as a continuous function of time. The camera poses are represented using an implicit neural function which maps the given time to the corresponding camera pose. The mapped camera poses are then used for the downstream tasks where joint camera pose optimization is also required. While doing so the network parameters - that implicitly represent camera poses - are optimized. We exploit the proposed method in four diverse experimental settings namely (1) NeRF from noisy poses; (2) NeRF from asynchronous Events; (3) Visual Simultaneous Localization and Mapping (vSLAM); and (4) vSLAM with IMUs. In all four settings the proposed method performs significantly better than the compared baselines and the state-of-the-art methods. Additionally using the assumption of continuous motion changes in pose may actually live in a manifold that has lower than 6 degrees of freedom (DOF) is also realized. We call this low DOF motion representation as the intrinsic motion and use the approach in vSLAM settings show ing impressive camera tracking performance.

OmniGlue: Generalizable Feature Matching with Foundation Model Guidance
Hanwen Jiang, Arjun Karpur, Bingyi Cao, Qixing Huang, André Araujo; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 19865-19875
The image matching field has been witnessing a continuous emergence of novel learnable feature matching techniques with ever-improving performance on conventional benchmarks. However our investigation shows that despite these gains their potential for real-world applications is restricted by their limited generalization capabilities to novel image domains. In this paper we introduce OmniGlue the first learnable image matcher that is designed with generalization as a core principle. OmniGlue leverages broad knowledge from a vision foundation model to guide the feature matching process boosting generalization to domains not seen at training time. Additionally we propose a novel keypoint position-guided attention mechanism which disentangles spatial and appearance information leading to enhanced matching descriptors. We perform comprehensive experiments on a suite of 6 datasets with varied image domains including scene-level object-centric and aerial images. OmniGlue's novel components lead to relative gains on unseen domains of 20.9% with respect to a directly comparable reference model while also outperforming the recent LightGlue method by 9.5% relatively. Code and model can be found at https://hwjiang1510.github.io/OmniGlue.

D^4: Dataset Distillation via Disentangled Diffusion Model
Duo Su, Junjie Hou, Weizhi Gao, Yingjie Tian, Bowen Tang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 5809-5818
Dataset distillation offers a lightweight synthetic dataset for fast network training with promising test accuracy. To imitate the performance of the original dataset most approaches employ bi-level optimization and the distillation space relies on the matching architecture. Nevertheless these approaches either suffer significant computational costs on large-scale datasets or experience performance decline on cross-architectures. We advocate for designing an economical dataset distillation framework that is independent of the matching architectures.With

empirical observations we argue that constraining the consistency of the real and synthetic image spaces will enhance the cross-architecture generalization. Motivated by this we introduce Dataset Distillation via Disentangled Diffusion Model (D^4M) an efficient framework for dataset distillation. Compared to architecture-dependent methods D^4M employs latent diffusion model to guarantee consistency and incorporates label information into category prototypes. The distilled datasets are versatile eliminating the need for repeated generation of distinct datasets for various architectures. Through comprehensive experiments D^4M demonstrates superior performance and robust generalization surpassing the SOTA methods across most aspects.

OmniSDF: Scene Reconstruction using Omnidirectional Signed Distance Functions and Adaptive Binoctrees
Hakyeong Kim, Andreas Meuleman, Hyeonjoong Jang, James Tompkin, Min H. Kim; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 20227-20236
We present a method to reconstruct indoor and outdoor static scene geometry and appearance from an omnidirectional video moving in a small circular sweep. This setting is challenging because of the small baseline and large depth ranges making it difficult to find ray crossings. To better constrain the optimization we estimate geometry as a signed distance field within a spherical binoctree data structure and use a complementary efficient tree traversal strategy based on a breadth-first search for sampling. Unlike regular grids or trees the shape of this structure well-matches the camera setting creating a better memory-quality trade-off. From an initial depth estimate the binoctree is adaptively subdivided throughout the optimization; previous methods use a fixed depth that leaves the scene undersampled. In comparison with three neural optimization methods and two non-neural methods ours shows decreased geometry error on average especially in a detailed scene while significantly reducing the required number of voxels to represent such details.

Generating Content for HDR Deghosting from Frequency View
Tao Hu, Qingsen Yan, Yuankai Qi, Yanning Zhang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 25732-25741
Recovering ghost-free High Dynamic Range (HDR) images from multiple Low Dynamic Range (LDR) images becomes challenging when the LDR images exhibit saturation and significant motion. Recent Diffusion Models (DMs) have been introduced in HDR imaging field demonstrating promising performance particularly in achieving visually perceptible results compared to previous DNN-based methods. However DMs require extensive iterations with large models to estimate entire images resulting in inefficiency that hinders their practical application. To address this challenge we propose the Low-Frequency aware Diffusion (LF-Diff) model for ghost-free HDR imaging. The key idea of LF-Diff is implementing the DMs in a highly compacted latent space and integrating it into a regression-based model to enhance the details of reconstructed images. Specifically as low-frequency information is closely related to human visual perception we propose to utilize DMs to create compact low-frequency priors for the reconstruction process. In addition to take full advantage of the above low-frequency priors the Dynamic HDR Reconstruction Network (DHRNet) is carried out in a regression-based manner to obtain final HDR images. Extensive experiments conducted on synthetic and real-world benchmark datasets demonstrate that our LF-Diff performs favorably against several state-of-the-art methods and is 10x faster than previous DM-based methods.

Iterated Learning Improves Compositionality in Large Vision-Language Models
Chenhao Zheng, Jieyu Zhang, Aniruddha Kembhavi, Ranjay Krishna; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 13785-13795
A fundamental characteristic common to both human vision and natural language is their compositional nature. Yet despite the performance gains contributed by large vision and language pretraining recent investigations find that most--if not

all--our state-of-the-art vision-language models struggle at compositionality. They are unable to distinguish between images of "a girl in white facing a man in black" and "a girl in black facing a man in white". Moreover prior work suggests that compositionality doesn't arise with scale: larger model sizes or training data don't help. This paper develops a new iterated training algorithm that incentivizes compositionality. We draw on decades of cognitive science research that identifies cultural transmission--the need to teach a new generation--as a necessary inductive prior that incentivizes humans to develop compositional languages. Specifically we reframe vision-language contrastive learning as the Lewis Signaling Game between a vision agent and a language agent and operationalize cultural transmission by iteratively resetting one of the agent's weights during training. After every iteration this training paradigm induces representations that become "easier to learn" a property of compositional languages: e.g. our model trained on CC3M and CC12M improves standard CLIP by 4.7% 4.0% respectfully in the SugarCrepe benchmark.

Event Stream-based Visual Object Tracking: A High-Resolution Benchmark Dataset and A Novel Baseline

Xiao Wang, Shiao Wang, Chuanming Tang, Lin Zhu, Bo Jiang, Yonghong Tian, Jin Tang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 19248-19257

Tracking with bio-inspired event cameras has garnered increasing interest in recent years. Existing works either utilize aligned RGB and event data for accurate tracking or directly learn an event-based tracker. The former incurs higher inference costs while the latter may be susceptible to the impact of noisy events or sparse spatial resolution. In this paper we propose a novel hierarchical knowledge distillation framework that can fully utilize multi-modal / multi-view information during training to facilitate knowledge transfer enabling us to achieve high-speed and low-latency visual tracking during testing by using only event signals. Specifically a teacher Transformer-based multi-modal tracking framework is first trained by feeding the RGB frame and event stream simultaneously. Then we design a new hierarchical knowledge distillation strategy which includes pairwise similarity feature representation and response maps-based knowledge distillation to guide the learning of the student Transformer network. In particular since existing event-based tracking datasets are all low-resolution (346 * 260) we propose the first large-scale high-resolution (1280 * 720) dataset named EventVOT. It contains 1141 videos and covers a wide range of categories such as pedestrians vehicles UAVs ping pong etc. Extensive experiments on both low-resolution (FE240hz VisEvent COESOT) and our newly proposed high-resolution EventVOT dataset fully validated the effectiveness of our proposed method. The dataset evaluation toolkit and source code will be released.

LiDAR-Net: A Real-scanned 3D Point Cloud Dataset for Indoor Scenes

Yanwen Guo, Yuanqi Li, Dayong Ren, Xiaohong Zhang, Jiawei Li, Liang Pu, Changfeng Ma, Xiaoyu Zhan, Jie Guo, Mingqiang Wei, Yan Zhang, Piaopiao Yu, Shuangyu Yang, Donghao Ji, Huisheng Ye, Hao Sun, Yansong Liu, Yinuo Chen, Jiaqi Zhu, Hongyu Liu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 21989-21999

In this paper we present LiDAR-Net a new real-scanned indoor point cloud dataset containing nearly 3.6 billion precisely point-level annotated points covering an expansive area of 30000m^2. It encompasses three prevalent daily environments including learning scenes working scenes and living scenes. LiDAR-Net is characterized by its non-uniform point distribution e.g. scanning holes and scanning lines. Additionally it meticulously records and annotates scanning anomalies including reflection noise and ghost. These anomalies stem from specular reflections on glass or metal as well as distortions due to moving persons. LiDAR-Net's realistic representation of non-uniform distribution and anomalies significantly enhances the training of deep learning models leading to improved generalization in practical applications. We thoroughly evaluate the performance of state-of-the-art algorithms on LiDAR-Net and provide a detailed analysis of the results. Cruc

ially our research identifies several fundamental challenges in understanding in door point clouds contributing essential insights to future explorations in this field. Our dataset can be found online: http://lidar-net.njumeta.com

Dual DETRs for Multi-Label Temporal Action Detection
Yuhan Zhu, Guozhen Zhang, Jing Tan, Gangshan Wu, Limin Wang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 18559-18569
Temporal Action Detection (TAD) aims to identify the action boundaries and the corresponding category within untrimmed videos. Inspired by the success of DETR in object detection several methods have adapted the query-based framework to the TAD task. However these approaches primarily followed DETR to predict actions at the instance level (i.e. identify each action by its center point) leading to sub-optimal boundary localization. To address this issue we propose a new Dual-level query-based TAD framework namely DualDETR to detect actions from both instance-level and boundary-level. Decoding at different levels requires semantics of different granularity therefore we introduce a two-branch decoding structure. This structure builds distinctive decoding processes for different levels facilitating explicit capture of temporal cues and semantics at each level. On top of the two-branch design we present a joint query initialization strategy to align queries from both levels. Specifically we leverage encoder proposals to match queries from each level in a one-to-one manner. Then the matched queries are initialized using position and content prior from the matched action proposal. The aligned dual-level queries can refine the matched proposal with complementary cues during subsequent decoding. We evaluate DualDETR on three challenging multi-label TAD benchmarks. The experimental results demonstrate the superior performance of DualDETR to the existing state-of-the-art methods achieving a substantial improvement under det-mAP and delivering impressive results under seg-mAP.

Rich Human Feedback for Text-to-Image Generation
Youwei Liang, Junfeng He, Gang Li, Peizhao Li, Arseniy Klimovskiy, Nicholas Carolan, Jiao Sun, Jordi Pont-Tuset, Sarah Young, Feng Yang, Junjie Ke, Krishnamurthy Dj Dvijotham, Katherine M. Collins, Yiwen Luo, Yang Li, Kai J Kohlhoff, Deepak Ramachandran, Vidhya Navalpakkam; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 19401-19411
Recent Text-to-Image (T2I) generation models such as Stable Diffusion and Imagen have made significant progress in generating high-resolution images based on text descriptions. However many generated images still suffer from issues such as artifacts/implausibility misalignment with text descriptions and low aesthetic quality. Inspired by the success of Reinforcement Learning with Human Feedback (RLHF) for large language models prior works collected human-provided scores as feedback on generated images and trained a reward model to improve the T2I generation. In this paper we enrich the feedback signal by (i) marking image regions that are implausible or misaligned with the text and (ii) annotating which words in the text prompt are misrepresented or missing on the image. We collect such rich human feedback on 18K generated images (RichHF-18K) and train a multimodal transformer to predict the rich feedback automatically. We show that the predicted rich human feedback can be leveraged to improve image generation for example by selecting high-quality training data to finetune and improve the generative models or by creating masks with predicted heatmaps to inpaint the problematic regions. Notably the improvements generalize to models (Muse) beyond those used to generate the images on which human feedback data were collected (Stable Diffusion variants). The RichHF-18K data set will be released in our GitHub repository: https://github.com/google-research/google-research/tree/master/richhf_18k.

360DVD: Controllable Panorama Video Generation with 360-Degree Video Diffusion Model
Qian Wang, Weiqi Li, Chong Mou, Xinhua Cheng, Jian Zhang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 6913-6923

Panorama video recently attracts more interest in both study and application cou
rtesy of its immersive experience. Due to the expensive cost of capturing 360-de
gree panoramic videos generating desirable panorama videos by prompts is urgentl
y required. Lately the emerging text-to-video (T2V) diffusion methods demonstrat
e notable effectiveness in standard video generation. However due to the signifi
cant gap in content and motion patterns between panoramic and standard videos th
ese methods encounter challenges in yielding satisfactory 360-degree panoramic v
ideos. In this paper we propose a pipeline named 360-Degree Video Diffusion mode
l (360DVD) for generating 360-degree panoramic videos based on the given prompts
 and motion conditions. Specifically we introduce a lightweight 360-Adapter acco
mpanied by 360 Enhancement Techniques to transform pre-trained T2V models for pa
norama video generation. We further propose a new panorama dataset named WEB360
consisting of panoramic video-text pairs for training 360DVD addressing the abse
nce of captioned panoramic video datasets. Extensive experiments demonstrate the
 superiority and effectiveness of 360DVD for panorama video generation.

Map-Relative Pose Regression for Visual Re-Localization
Shuai Chen, Tommaso Cavallari, Victor Adrian Prisacariu, Eric Brachmann; Proceed
ings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR
), 2024, pp. 20665-20674
Pose regression networks predict the camera pose of a query image relative to a
known environment. Within this family of methods absolute pose regression (APR)
has recently shown promising accuracy in the range of a few centimeters in posit
ion error. APR networks encode the scene geometry implicitly in their weights. T
o achieve high accuracy they require vast amounts of training data that realisti
cally can only be created using novel view synthesis in a days-long process. Thi
s process has to be repeated for each new scene again and again. We present a ne
w approach to pose regression map-relative pose regression (marepo) that satisfi
es the data hunger of the pose regression network in a scene-agnostic fashion. W
e condition the pose regressor on a scene-specific map representation such that
its pose predictions are relative to the scene map. This allows us to train the
pose regressor across hundreds of scenes to learn the generic relation between a
 scene-specific map representation and the camera pose. Our map-relative pose re
gressor can be applied to new map representations immediately or after mere minu
tes of fine-tuning for the highest accuracy. Our approach outperforms previous p
ose regression methods by far on two public datasets indoor and outdoor. Code is
 available: https://nianticlabs.github.io/marepo.

Implicit Event-RGBD Neural SLAM
Delin Qu, Chi Yan, Dong Wang, Jie Yin, Qizhi Chen, Dan Xu, Yiting Zhang, Bin Zha
o, Xuelong Li; Proceedings of the IEEE/CVF Conference on Computer Vision and Pat
tern Recognition (CVPR), 2024, pp. 19584-19594
Implicit neural SLAM has achieved remarkable progress recently. Nevertheless exi
sting methods face significant challenges in non-ideal scenarios such as motion
blur or lighting variation which often leads to issues like convergence failures
 localization drifts and distorted mapping. To address these challenges we propo
se EN-SLAM the first event-RGBD implicit neural SLAM framework which effectively
 leverages the high rate and high dynamic range advantages of event data for tra
cking and mapping. Specifically EN-SLAM proposes a differentiable CRF (Camera Re
sponse Function) rendering technique to generate distinct RGB and event camera d
ata via a shared radiance field which is optimized by learning a unified implici
t representation with the captured event and RGBD supervision. Moreover based on
 the temporal difference property of events we propose a temporal aggregating op
timization strategy for the event joint tracking and global bundle adjustment ca
pitalizing on the consecutive difference constraints of events significantly enh
ancing tracking accuracy and robustness. Finally we construct the simulated data
set DEV-Indoors and real captured dataset DEV-Reals containing 6 scenes 17 seque
nces with practical motion blur and lighting changes for evaluations. Experiment
al results show that our method outperforms the SOTA methods in both tracking AT
E and mapping ACC with a real-time 17 FPS in various challenging environments. P

roject page: https://delinqu.github.io/EN-SLAM.

Virtual Immunohistochemistry Staining for Histological Images Assisted by Weakly-supervised Learning
Jiahan Li, Jiuyang Dong, Shenjin Huang, Xi Li, Junjun Jiang, Xiaopeng Fan, Yongbing Zhang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 11259-11268
Recently virtual staining technology has greatly promoted the advancement of histopathology. Despite the practical successes achieved the outstanding performance of most virtual staining methods relies on hard-to-obtain paired images in training. In this paper we propose a method for virtual immunohistochemistry (IHC) staining named confusion-GAN which does not require paired images and can achieve comparable performance to supervised algorithms. Specifically we propose a multi-branch discriminator which judges if the features of generated images can be embedded into the feature pool of target domain images to improve the visual quality of generated images. Meanwhile we also propose a novel patch-level pathology information extractor which is assisted by multiple instance learning to ensure pathological consistency during virtual staining. Extensive experiments were conducted on three types of IHC images including a high-resolution hepatocellular carcinoma immunohistochemical dataset proposed by us. The results demonstrated that our proposed confusion-GAN can generate highly realistic images that are capable of deceiving even experienced pathologists. Furthermore compared to using H&E images directly the downstream diagnosis achieved higher accuracy when using images generated by confusion-GAN. Our dataset and codes will be available at https://github.com/jiahanli2022/confusion-GAN.

DeCoTR: Enhancing Depth Completion with 2D and 3D Attentions
Yunxiao Shi, Manish Kumar Singh, Hong Cai, Fatih Porikli; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 10736-10746
In this paper we introduce a novel approach that harnesses both 2D and 3D attentions to enable highly accurate depth completion without requiring iterative spatial propagations. Specifically we first enhance a baseline convolutional depth completion model by applying attention to 2D features in the bottleneck and skip connections. This effectively improves the performance of this simple network and sets it on par with the latest complex transformer-based models. Leveraging the initial depths and features from this network we uplift the 2D features to form a 3D point cloud and construct a 3D point transformer to process it allowing the model to explicitly learn and exploit 3D geometric features. In addition we propose normalization techniques to process the point cloud which improves learning and leads to better accuracy than directly using point transformers off the shelf. Furthermore we incorporate global attention on downsampled point cloud features which enables long-range context while still being computationally feasible. We evaluate our method DeCoTR on established depth completion benchmarks including NYU Depth V2 and KITTI showcasing that it sets new state-of-the-art performance. We further conduct zero-shot evaluations on ScanNet and DDAD benchmarks and demonstrate that DeCoTR has superior generalizability compared to existing approaches.
****
Utility-Fairness Trade-Offs and How to Find Them
Sepehr Dehdashtian, Bashir Sadeghi, Vishnu Naresh Boddeti; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 12037-12046
When building classification systems with demographic fairness considerations there are two objectives to satisfy: 1) maximizing utility for the specific task and 2) ensuring fairness w.r.t. a known demographic attribute. These objectives often compete so optimizing both can lead to a trade-off between utility and fairness. While existing works acknowledge the trade-offs and study their limits two questions remain unanswered: 1) What are the optimal tradeoffs between utility and fairness? and 2) How can we numerically quantify these trade-offs from data

for a desired prediction task and demographic attribute of interest? This paper addresses these questions. We introduce two utility-fairness trade-offs: the Data-Space and Label-Space Trade-off. The trade-offs reveal three regions within the utility-fairness plane delineating what is fully and partially possible and impossible. We propose U-FaTE a method to numerically quantify the trade-offs for a given prediction task and group fairness definition from data samples. Based on the trade-offs we introduce a new scheme for evaluating representations. An extensive evaluation of fair representation learning methods and representations from over 1000 pre-trained models revealed that most current approaches are far from the estimated and achievable fairness-utility trade-offs across multiple datasets and prediction tasks.

Domain-Specific Block Selection and Paired-View Pseudo-Labeling for Online Test-Time Adaptation
Yeonguk Yu, Sungho Shin, Seunghyeok Back, Mihwan Ko, Sangjun Noh, Kyoobin Lee; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 22723-22732
Test-time adaptation (TTA) aims to adapt a pre-trained model to a new test domain without access to source data after deployment. Existing approaches typically rely on self-training with pseudo-labels since ground-truth cannot be obtained from test data. Although the quality of pseudo labels is important for stable and accurate long-term adaptation it has not been previously addressed. In this work we propose DPLOT a simple yet effective TTA framework that consists of two components: (1) domain-specific block selection and (2) pseudo-label generation using paired-view images. Specifically we select blocks that involve domain-specific feature extraction and train these blocks by entropy minimization. After blocks are adjusted for current test domain we generate pseudo-labels by averaging given test images and corresponding flipped counterparts. By simply using flip augmentation we prevent a decrease in the quality of the pseudo-labels which can be caused by the domain gap resulting from strong augmentation. Our experimental results demonstrate that DPLOT outperforms previous TTA methods in CIFAR10-C CIFAR100-C and ImageNet-C benchmarks reducing error by up to 5.4% 9.1% and 2.9% respectively. Also we provide an extensive analysis to demonstrate effectiveness of our framework. Code is available at https://github.com/gist-ailab/domain-specific-block-selection-and-paired-view-pseudo-labeling-for-online-TTA.

Aerial Lifting: Neural Urban Semantic and Building Instance Lifting from Aerial Imagery
Yuqi Zhang, Guanying Chen, Jiaxing Chen, Shuguang Cui; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 21092-21103
We present a neural radiance field method for urban-scale semantic and building-level instance segmentation from aerial images by lifting noisy 2D labels to 3D. This is a challenging problem due to two primary reasons. Firstly objects in urban aerial images exhibit substantial variations in size including buildings cars and roads which pose a significant challenge for accurate 2D segmentation. Secondly the 2D labels generated by existing segmentation methods suffer from the multi-view inconsistency problem especially in the case of aerial images where each image captures only a small portion of the entire scene. To overcome these limitations we first introduce a scale-adaptive semantic label fusion strategy that enhances the segmentation of objects of varying sizes by combining labels predicted from different altitudes harnessing the novel-view synthesis capabilities of NeRF. We then introduce a novel cross-view instance label grouping strategy based on the 3D scene representation to mitigate the multi-view inconsistency problem in the 2D instance labels. Furthermore we exploit multi-view reconstructed depth priors to improve the geometric quality of the reconstructed radiance field resulting in enhanced segmentation results. Experiments on multiple real-world urban-scale datasets demonstrate that our approach outperforms existing methods highlighting its effectiveness. The source code is available at https://github.com/zyqz97/Aerial_lifting.

****
SAOR: Single-View Articulated Object Reconstruction
Mehmet Aygun, Oisin Mac Aodha; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 10382-10391
We introduce SAOR a novel approach for estimating the 3D shape texture and viewpoint of an articulated object from a single image captured in the wild. Unlike prior approaches that rely on pre-defined category-specific 3D templates or tailored 3D skeletons SAOR learns to articulate shapes from single-view image collections with a skeleton-free part-based model without requiring any 3D object shape priors. To prevent ill-posed solutions we propose a cross-instance consistency loss that exploits disentangled object shape deformation and articulation. This is helped by a new silhouette-based sampling mechanism to enhance viewpoint diversity during training. Our method only requires estimated object silhouettes and relative depth maps from off-the-shelf pre-trained networks during training. At inference time given a single-view image it efficiently outputs an explicit mesh representation. We obtain improved qualitative and quantitative results on challenging quadruped animals compared to relevant existing work.
****
A Theory of Joint Light and Heat Transport for Lambertian Scenes
Mani Ramanagopal, Sriram Narayanan, Aswin C. Sankaranarayanan, Srinivasa G. Narasimhan; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 11924-11933
We present a novel theory that establishes the relationship between light transport in visible and thermal infrared and heat transport in solids. We show that heat generated due to light absorption can be estimated by modeling heat transport using a thermal camera. For situations where heat conduction is negligible we analytically solve the heat transport equation to derive a simple expression relating the change in thermal image intensity to the absorbed light intensity and heat capacity of the material. Next we prove that intrinsic image decomposition for Lambertian scenes becomes a well-posed problem if one has access to the absorbed light. Our theory generalizes to arbitrary shapes and unstructured illumination. Our theory is based on applying energy conservation principle at each pixel independently. We validate our theory using real-world experiments on diffuse objects made of different materials that exhibit both direct and global components (inter-reflections) of light transport under unknown complex lighting.

iKUN: Speak to Trackers without Retraining
Yunhao Du, Cheng Lei, Zhicheng Zhao, Fei Su; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 19135-19144
Referring multi-object tracking (RMOT) aims to track multiple objects based on input textual descriptions. Previous works realize it by simply integrating an extra textual module into the multi-object tracker. However they typically need to retrain the entire framework and have difficulties in optimization. In this work we propose an insertable Knowledge Unification Network termed iKUN to enable communication with off-the-shelf trackers in a plug-and-play manner. Concretely a knowledge unification module (KUM) is designed to adaptively extract visual features based on textual guidance. Meanwhile to improve the localization accuracy we present a neural version of Kalman filter (NKF) to dynamically adjust process noise and observation noise based on the current motion status. Moreover to address the problem of open-set long-tail distribution of textual descriptions a test-time similarity calibration method is proposed to refine the confidence score with pseudo frequency. Extensive experiments on Refer-KITTI dataset verify the effectiveness of our framework. Finally to speed up the development of RMOT we also contribute a more challenging dataset Refer-Dance by extending public DanceTrack dataset with motion and dressing descriptions. The codes and dataset are available at https://github.com/dyhBUPT/iKUN.

RankMatch: Exploring the Better Consistency Regularization for Semi-supervised Semantic Segmentation
Huayu Mai, Rui Sun, Tianzhu Zhang, Feng Wu; Proceedings of the IEEE/CVF Conferen

ce on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 3391-3401
The key lie in semi-supervised semantic segmentation is how to fully exploit substantial unlabeled data to improve the model's generalization performance by resorting to constructing effective supervision signals. Most methods tend to directly apply contrastive learning to seek additional supervision to complement independent regular pixel-wise consistency regularization. However these methods tend not to be preferred ascribed to their complicated designs heavy memory footprints and susceptibility to confirmation bias. In this paper we analyze the bottlenecks exist in contrastive learning-based methods and offer a fresh perspective on inter-pixel correlations to construct more safe and effective supervision signals which is in line with the nature of semantic segmentation. To this end we develop a coherent RankMatch network including the construction of representative agents to model inter-pixel correlation beyond regular individual pixel-wise consistency and further unlock the potential of agents by modeling inter-agent relationships in pursuit of rank-aware correlation consistency. Extensive experimental results on multiple benchmarks including mitochondria segmentation demonstrate that RankMatch performs favorably against state-of-the-art methods. Particularly in the low-data regimes RankMatch achieves significant improvements.
****
Facial Identity Anonymization via Intrinsic and Extrinsic Attention Distraction
Zhenzhong Kuang, Xiaochen Yang, Yingjie Shen, Chao Hu, Jun Yu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 12406-12415
The unprecedented capture and application of face images raise increasing concerns on anonymization to fight against privacy disclosure. Most existing methods may suffer from the problem of excessive change of the identity-independent information or insufficient identity protection. In this paper we present a new face anonymization approach by distracting the intrinsic and extrinsic identity attentions. On the one hand we anonymize the identity information in the feature space by distracting the intrinsic identity attention. On the other we anonymize the visual clues (i.e. appearance and geometry structure) by distracting the extrinsic identity attention. Our approach allows for flexible and intuitive manipulation of face appearance and geometry structure to produce diverse results and it can also be used to instruct users to perform personalized anonymization. We conduct extensive experiments on multiple datasets and demonstrate that our approach outperforms state-of-the-art methods.
****
3D-SceneDreamer: Text-Driven 3D-Consistent Scene Generation
Songchun Zhang, Yibo Zhang, Quan Zheng, Rui Ma, Wei Hua, Hujun Bao, Weiwei Xu, Changqing Zou; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 10170-10180
Text-driven 3D scene generation techniques have made rapid progress in recent years. Their success is mainly attributed to using existing generative models to iteratively perform image warping and inpainting to generate 3D scenes. However these methods heavily rely on the outputs of existing models leading to error accumulation in geometry and appearance that prevent the models from being used in various scenarios (e.g. outdoor and unreal scenarios). To address this limitation we generatively refine the newly generated local views by querying and aggregating global 3D information and then progressively generate the 3D scene. Specifically we employ a tri-plane features-based NeRF as a unified representation of the 3D scene to constrain global 3D consistency and propose a generative refinement network to synthesize new contents with higher quality by exploiting the natural image prior from 2D diffusion model as well as the global 3D information of the current scene. Our extensive experiments demonstrate that in comparison to previous methods our approach supports wide variety of scene generation and arbitrary camera trajectories with improved visual quality and 3D consistency.

VMINer: Versatile Multi-view Inverse Rendering with Near- and Far-field Light Sources
Fan Fei, Jiajun Tang, Ping Tan, Boxin Shi; Proceedings of the IEEE/CVF Conferenc

e on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 11800-11809
This paper introduces a versatile multi-view inverse rendering framework with near- and far-field light sources. Tackling the fundamental challenge of inherent ambiguity in inverse rendering our framework adopts a lightweight yet inclusive lighting model for different near- and far-field lights thus is able to make use of input images under varied lighting conditions available during capture. It leverages observations under each lighting to disentangle the intrinsic geometry and material from the external lighting using both neural radiance field rendering and physically-based surface rendering on the 3D implicit fields. After training the reconstructed scene is extracted to a textured triangle mesh for seamless integration into industrial rendering software for various applications. Quantitatively and qualitatively tested on synthetic and real-world scenes our method shows superiority to state-of-the-art multi-view inverse rendering methods in both speed and quality.

RoHM: Robust Human Motion Reconstruction via Diffusion
Siwei Zhang, Bharat Lal Bhatnagar, Yuanlu Xu, Alexander Winkler, Petr Kadlecek, Siyu Tang, Federica Bogo; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 14606-14617
We propose RoHM an approach for robust 3D human motion reconstruction from monocular RGB(-D) videos in the presence of noise and occlusions. Most previous approaches either train neural networks to directly regress motion in 3D or learn data-driven motion priors and combine them with optimization at test time. RoHM is a novel diffusion-based motion model that conditioned on noisy and occluded input data reconstructs complete plausible motions in consistent global coordinates. Given the complexity of the problem -- requiring one to address different tasks (denoising and infilling) in different solution spaces (local and global motion) -- we decompose it into two sub-tasks and learn two models one for global trajectory and one for local motion. To capture the correlations between the two we then introduce a novel conditioning module combining it with an iterative inference scheme. We apply RoHM to a variety of tasks -- from motion reconstruction and denoising to spatial and temporal infilling. Extensive experiments on three popular datasets show that our method outperforms state-of-the-art approaches qualitatively and quantitatively while being faster at test time. The code is available at https://sanweiliti.github.io/ROHM/ROHM.html.

Do You Remember? Dense Video Captioning with Cross-Modal Memory Retrieval
Minkuk Kim, Hyeon Bae Kim, Jinyoung Moon, Jinwoo Choi, Seong Tae Kim; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 13894-13904
There has been significant attention to the research on dense video captioning which aims to automatically localize and caption all events within untrimmed video. Several studies introduce methods by designing dense video captioning as a multitasking problem of event localization and event captioning to consider inter-task relations. However addressing both tasks using only visual input is challenging due to the lack of semantic content. In this study we address this by proposing a novel framework inspired by the cognitive information processing of humans. Our model utilizes external memory to incorporate prior knowledge. The memory retrieval method is proposed with cross-modal video-to-text matching. To effectively incorporate retrieved text features the versatile encoder and the decoder with visual and textual cross-attention modules are designed. Comparative experiments have been conducted to show the effectiveness of the proposed method on ActivityNet Captions and YouCook2 datasets. Experimental results show promising performance of our model without extensive pretraining from a large video dataset. Our code is available at https://github.com/ailab-kyunghee/CM2_DVC.

DuPL: Dual Student with Trustworthy Progressive Learning for Robust Weakly Supervised Semantic Segmentation
Yuanchen Wu, Xichen Ye, Kequan Yang, Jide Li, Xiaoqiang Li; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp.

3534-3543
Recently One-stage Weakly Supervised Semantic Segmentation (WSSS) with image-lev
el labels has gained increasing interest due to simplification over its cumberso
me multi-stage counterpart. Limited by the inherent ambiguity of Class Activatio
n Map (CAM) we observe that one-stage pipelines often encounter confirmation bia
s caused by incorrect CAM pseudo-labels impairing their final segmentation perfo
rmance. Although recent works discard many unreliable pseudo-labels to implicitl
y alleviate this issue they fail to exploit sufficient supervision for their mod
els. To this end we propose a dual student framework with trustworthy progressiv
e learning (DuPL). Specifically we propose a dual student network with a discrep
ancy loss to yield diverse CAMs for each sub-net. The two sub-nets generate supe
rvision for each other mitigating the confirmation bias caused by learning their
 own incorrect pseudo-labels. In this process we progressively introduce more tr
ustworthy pseudo-labels to be involved in the supervision through dynamic thresh
old adjustment with an adaptive noise filtering strategy. Moreover we believe th
at every pixel even discarded from supervision due to its unreliability is impor
tant for WSSS. Thus we develop consistency regularization on these discarded reg
ions providing supervision of every pixel. Experiment results demonstrate the su
periority of the proposed DuPL over the recent state-of-the-art alternatives on
PASCAL VOC 2012 and MS COCO datasets. Code is available at https://github.com/Wu
0409/DuPL.

Learning with Structural Labels for Learning with Noisy Labels
Noo-ri Kim, Jin-Seop Lee, Jee-Hyong Lee; Proceedings of the IEEE/CVF Conference
on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 27610-27620
Deep Neural Networks (DNNs) have demonstrated remarkable performance across dive
rse domains and tasks with large-scale datasets. To reduce labeling costs for la
rge-scale datasets semi-automated and crowdsourcing labeling methods are develop
ed but their labels are inevitably noisy. Learning with Noisy Labels (LNL) appro
aches aim to train DNNs despite the presence of noisy labels. These approaches u
tilize the memorization effect to select correct labels and refine noisy ones wh
ich are then used for subsequent training. However these methods encounter a sig
nificant decrease in the model's generalization performance due to the inevitabl
y existing noise labels. To overcome this limitation we propose a new approach t
o enhance learning with noisy labels by incorporating additional distribution in
formation--structural labels. In order to leverage additional distribution infor
mation for generalization we employ a reverse k-NN which helps the model in achi
eving a better feature manifold and mitigating overfitting to noisy labels. The
proposed method shows outperformed performance in multiple benchmark datasets wi
th IDN and real-world noisy datasets.
****
SurMo: Surface-based 4D Motion Modeling for Dynamic Human Rendering
Tao Hu, Fangzhou Hong, Ziwei Liu; Proceedings of the IEEE/CVF Conference on Comp
uter Vision and Pattern Recognition (CVPR), 2024, pp. 6550-6560
Dynamic human rendering from video sequences has achieved remarkable progress by
 formulating the rendering as a mapping from static poses to human images. Howev
er existing methods focus on the human appearance reconstruction of every single
 frame while the temporal motion relations are not fully explored. In this paper
 we propose a new 4D motion modeling paradigm SurMo that jointly models the temp
oral dynamics and human appearances in a unified framework with three key design
s: 1) Surface-based motion encoding that models 4D human motions with an efficie
nt compact surface-based triplane. It encodes both spatial and temporal motion r
elations on the dense surface manifold of a statistical body template which inhe
rits body topology priors for generalizable novel view synthesis with sparse tra
ining observations. 2) Physical motion decoding that is designed to encourage ph
ysical motion learning by decoding the motion triplane features at timestep t to
 predict both spatial derivatives and temporal derivatives at the next timestep
t+1 in the training stage. 3) 4D appearance decoding that renders the motion tri
planes into images by an efficient volumetric surface-conditioned renderer that
focuses on the rendering of body surfaces with motion learning conditioning. Ext

ensive experiments validate the state-of-the-art performance of our new paradigm and illustrate the expressiveness of surface-based motion triplanes for rendering high-fidelity view-consistent humans with fast motions and even motion-dependent shadows. Our project page is at: https://taohuumd.github.io/projects/SurMo.

SPAD: Spatially Aware Multi-View Diffusers
Yash Kant, Aliaksandr Siarohin, Ziyi Wu, Michael Vasilkovsky, Guocheng Qian, Jian Ren, Riza Alp Guler, Bernard Ghanem, Sergey Tulyakov, Igor Gilitschenski; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 10026-10038
We present SPAD a novel approach for creating consistent multi-view images from text prompts or single images. To enable multi-view generation we repurpose a pretrained 2D diffusion model by extending its self-attention layers with cross-view interactions and fine-tune it on a high quality subset of Objaverse. We find that a naive extension of the self-attention proposed in prior work (e.g. MVDream) leads to content copying between views. Therefore we explicitly constrain the cross-view attention based on epipolar geometry. To further enhance 3D consistency we utilize Pl ?ucker coordinates derived from camera rays and inject them as positional encoding. This enables SPAD to reason over spatial proximity in 3D well. Compared to concurrent works that can only generate views at fixed azimuth and elevation (e.g. MVDream SyncDreamer) SPAD offers full camera control and achieves state-of-the-art results in novel view synthesis on unseen objects from the Objaverse and Google Scanned Objects datasets. Finally we demonstrate that text-to-3D generation using SPAD prevents the multi-face Janus issue.

Gradient Reweighting: Towards Imbalanced Class-Incremental Learning
Jiangpeng He; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 16668-16677
Class-Incremental Learning (CIL) trains a model to continually recognize new classes from non-stationary data while retaining learned knowledge. A major challenge of CIL arises when applying to real-world data characterized by non-uniform distribution which introduces a dual imbalance problem involving (i) disparities between stored exemplars of old tasks and new class data (inter-phase imbalance) and (ii) severe class imbalances within each individual task (intra-phase imbalance). We show that this dual imbalance issue causes skewed gradient updates with biased weights in FC layers thus inducing over/under-fitting and catastrophic forgetting in CIL. Our method addresses it by reweighting the gradients towards balanced optimization and unbiased classifier learning. Additionally we observe imbalanced forgetting where paradoxically the instance-rich classes suffer higher performance degradation during CIL due to a larger amount of training data becoming unavailable in subsequent learning phases. To tackle this we further introduce a distribution-aware knowledge distillation loss to mitigate forgetting by aligning output logits proportionally with the distribution of lost training data. We validate our method on CIFAR-100 ImageNetSubset and Food101 across various evaluation protocols and demonstrate consistent improvements compared to existing works showing great potential to apply CIL in real-world scenarios with enhanced robustness and effectiveness.

Hierarchical Spatio-temporal Decoupling for Text-to-Video Generation
Zhiwu Qing, Shiwei Zhang, Jiayu Wang, Xiang Wang, Yujie Wei, Yingya Zhang, Changxin Gao, Nong Sang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 6635-6645
Despite diffusion models having shown powerful abilities to generate photorealistic images generating videos that are realistic and diverse still remains in its infancy. One of the key reasons is that current methods intertwine spatial content and temporal dynamics together leading to a notably increased complexity of text-to-video generation (T2V). In this work we propose HiGen a diffusion model-based method that improves performance by decoupling the spatial and temporal factors of videos from two perspectives i.e. structure level and content level. At the structure level we decompose the T2V task into two steps including spatial

reasoning and temporal reasoning using a unified denoiser. Specifically we generate spatially coherent priors using text during spatial reasoning and then generate temporally coherent motions from these priors during temporal reasoning. At the content level we extract two subtle cues from the content of the input video that can express motion and appearance changes respectively. These two cues then guide the model's training for generating videos enabling flexible content variations and enhancing temporal stability. Through the decoupled paradigm HiGen can effectively reduce the complexity of this task and generate realistic videos with semantics accuracy and motion stability. Extensive experiments demonstrate the superior performance of HiGen over the state-of-the-art T2V methods. We have released our source code and models.

PLACE: Adaptive Layout-Semantic Fusion for Semantic Image Synthesis
Zhengyao Lv, Yuxiang Wei, Wangmeng Zuo, Kwan-Yee K. Wong; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 9264-9274
Recent advancements in large-scale pre-trained text-to-image models have led to remarkable progress in semantic image synthesis. Nevertheless synthesizing high-quality images with consistent semantics and layout remains a challenge. In this paper we propose the adaPtive LAyout-semantiC fusion modulE (PLACE) that harnesses pre-trained models to alleviate the aforementioned issues. Specifically we first employ the layout control map to faithfully represent layouts in the feature space. Subsequently we combine the layout and semantic features in a timestep-adaptive manner to synthesize images with realistic details. During fine-tuning we propose the Semantic Alignment (SA) loss to further enhance layout alignment. Additionally we introduce the Layout-Free Prior Preservation (LFP) loss which leverages unlabeled data to maintain the priors of pre-trained models thereby improving the visual quality and semantic consistency of synthesized images. Extensive experiments demonstrate that our approach performs favorably in terms of visual quality semantic consistency and layout alignment. The source code and model are available at \href https://github.com/cszy98/PLACE/tree/main PLACE .

Exploring Efficient Asymmetric Blind-Spots for Self-Supervised Denoising in Real-World Scenarios
Shiyan Chen, Jiyuan Zhang, Zhaofei Yu, Tiejun Huang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 2814-2823
Self-supervised denoising has attracted widespread attention due to its ability to train without clean images. However noise in real-world scenarios is often spatially correlated which causes many self-supervised algorithms that assume pixel-wise independent noise to perform poorly. Recent works have attempted to break noise correlation with downsampling or neighborhood masking. However denoising on downsampled subgraphs can lead to aliasing effects and loss of details due to a lower sampling rate. Furthermore the neighborhood masking methods either come with high computational complexity or do not consider local spatial preservation during inference. Through the analysis of existing methods we point out that the key to obtaining high-quality and texture-rich results in real-world self-supervised denoising tasks is to train at the original input resolution structure and use asymmetric operations during training and inference. Based on this we propose Asymmetric Tunable Blind-Spot Network (AT-BSN) where the blind-spot size can be freely adjusted thus better balancing noise correlation suppression and image local spatial destruction during training and inference. In addition we regard the pre-trained AT-BSN as a meta-teacher network capable of generating various teacher networks by sampling different blind-spots. We propose a blind-spot based multi-teacher distillation strategy to distill a lightweight network significantly improving performance. Experimental results on multiple datasets prove that our method achieves state-of-the-art and is superior to other self-supervised algorithms in terms of computational overhead and visual effects.

Gaussian Splatting SLAM

Hidenobu Matsuki, Riku Murai, Paul H.J. Kelly, Andrew J. Davison; Proceedings of
 the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024
, pp. 18039-18048
We present the first application of 3D Gaussian Splatting in monocular SLAM the
most fundamental but the hardest setup for Visual SLAM. Our method which runs li
ve at 3fps utilises Gaussians as the only 3D representation unifying the require
d representation for accurate efficient tracking mapping and high-quality render
ing. Designed for challenging monocular settings our approach is seamlessly exte
ndable to RGB-D SLAM when an external depth sensor is available. Several innovat
ions are required to continuously reconstruct 3D scenes with high fidelity from
a live camera. First to move beyond the original 3DGS algorithm which requires a
ccurate poses from an offline Structure from Motion (SfM) system we formulate ca
mera tracking for 3DGS using direct optimisation against the 3D Gaussians and sh
ow that this enables fast and robust tracking with a wide basin of convergence.
Second by utilising the explicit nature of the Gaussians we introduce geometric
verification and regularisation to handle the ambiguities occurring in increment
al 3D dense reconstruction. Finally we introduce a full SLAM system which not on
ly achieves state-of-the-art results in novel view synthesis and trajectory esti
mation but also reconstruction of tiny and even transparent objects.

Not All Classes Stand on Same Embeddings: Calibrating a Semantic Distance with M
etric Tensor
Jae Hyeon Park, Gyoomin Lee, Seunggi Park, Sung In Cho; Proceedings of the IEEE/
CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 1772
2-17731
The consistency training (CT)-based semi-supervised learning (SSL) bites state-o
f-the-art performance on SSL-based image classification. However the existing CT
-based SSL methods do not highlight the non-Euclidean characteristics and class-
wise varieties of embedding spaces in an SSL model thus they cannot fully utiliz
e the effectiveness of CT. Thus we propose a metric tensor-based consistency reg
ularization exploiting the class-variant geometrical structure of embeddings on
the high-dimensional feature space. The proposed method not only minimizes the p
rediction discrepancy between different views of a given image but also estimate
s the intrinsic geometric curvature of embedding spaces by employing the global
and local metric tensors. The global metric tensor is used to globally estimate
the class-invariant embeddings from the whole data distribution while the local
metric tensor is exploited to estimate the class-variant embeddings of each clus
ter. The two metric tensors are optimized by the consistency regularization base
d on the weak and strong augmentation strategy. The proposed method provides the
 highest classification accuracy on average compared to the existing state-of-th
e-art SSL methods on conventional datasets.

A Simple Recipe for Contrastively Pre-training Video-First Encoders Beyond 16 Fr
ames
Pinelopi Papalampidi, Skanda Koppula, Shreya Pathak, Justin Chiu, Joe Heyward, V
iorica Patraucean, Jiajun Shen, Antoine Miech, Andrew Zisserman, Aida Nematzdeh;
 Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recogniti
on (CVPR), 2024, pp. 14386-14397
Understanding long real-world videos requires modeling of long-range visual depe
ndencies. To this end we explore video-first architectures building on the commo
n paradigm of transferring large-scale image--text models to video via shallow t
emporal fusion. However we expose two limitations to the approach: (1) decreased
 spatial capabilities likely due to poor video--language alignment in standard v
ideo datasets and (2) higher memory consumption bottlenecking the number of fram
es that can be processed. To mitigate the memory bottleneck we systematically an
alyze the memory/accuracy trade-off of various efficient methods: factorized att
ention parameter-efficient image-to-video adaptation input masking and multi-res
olution patchification. Surprisingly simply masking large portions of the video
(up to 75%) during contrastive pre-training proves to be one of the most robust
ways to scale encoders to videos up to 4.3 minutes at 1 FPS. Our simple approach

for training long video-to-text models which scales to 1B parameters does not add new architectural complexity and is able to outperform the popular paradigm of using much larger LLMs as an information aggregator over segment-based information on benchmarks with long-range temporal dependencies (YouCook2 EgoSchema).
****
DeMatch: Deep Decomposition of Motion Field for Two-View Correspondence Learning
Shihua Zhang, Zizhuo Li, Yuan Gao, Jiayi Ma; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 20278-20287
Two-view correspondence learning has recently focused on considering the coherence and smoothness of the motion field between an image pair. Dominant schemes include controlling the complexity of the field function with regularization or smoothing the field with local filters but the former suffers from heavy computational burden and the latter fails to accommodate discontinuities in the case of large scene disparities. In this paper inspired by Fourier expansion we propose a novel network called DeMatch which decomposes the motion field to retain its main "low-frequency" and smooth part. This achieves implicit regularization with lower computational cost and generates piecewise smoothness naturally. Specifically we first decompose the rough motion field that is contaminated by false matches into several different sub-fields which are highly smooth and contain the main energy of the original field. Then with these smooth sub-fields we recover a cleaner motion field from which correct motion vectors are subsequently derived. We also design a special masked decomposition strategy to further mitigate the negative influence of false matches. All the mentioned processes are finally implemented in a discrete and learnable manner avoiding the difficulty of calculating real dense fields. Extensive experiments reveal that DeMatch outperforms state-of-the-art methods in multiple tasks and shows promising low computational usage and piecewise smoothness property. The code and trained models are publicly available at https://github.com/SuhZhang/DeMatch.

Hierarchical Diffusion Policy for Kinematics-Aware Multi-Task Robotic Manipulation
Xiao Ma, Sumit Patidar, Iain Haughton, Stephen James; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 18081-18090
This paper introduces Hierarchical Diffusion Policy (HDP) a hierarchical agent for multi-task robotic manipulation. HDP factorises a manipulation policy into a hierarchical structure: a high-level task-planning agent which predicts a distant next-best end-effector pose (NBP) and a low-level goal-conditioned diffusion policy which generates optimal motion trajectories. The factorised policy representation allows HDP to tackle both long-horizon task planning while generating fine-grained low-level actions. To generate context-aware motion trajectories while satisfying robot kinematics constraints we present a novel kinematics-aware goal-conditioned control agent Robot Kinematics Diffuser (RK-Diffuser). Specifically RK-Diffuser learns to generate both the end-effector pose and joint position trajectories and distill the accurate but kinematics-unaware end-effector pose diffuser to the kinematics-aware but less accurate joint position diffuser via differentiable kinematics. Empirically we show that HDP achieves a significantly higher success rate than the state-of-the-art methods in both simulation and real-world.

Efficient Multi-scale Network with Learnable Discrete Wavelet Transform for Blind Motion Deblurring
Xin Gao, Tianheng Qiu, Xinyu Zhang, Hanlin Bai, Kang Liu, Xuan Huang, Hu Wei, Guoying Zhang, Huaping Liu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 2733-2742
Coarse-to-fine schemes are widely used in traditional single-image motion deblur; however in the context of deep learning existing multi-scale algorithms not only require the use of complex modules for feature fusion of low-scale RGB images and deep semantics but also manually generate low-resolution pairs of images that do not have sufficient confidence. In this work we propose a multi-scale netw

ork based on single-input and multiple-outputs(SIMO) for motion deblurring. This simplifies the complexity of algorithms based on a coarse-to-fine scheme. To alleviate restoration defects impacting detail information brought about by using a multi-scale architecture we combine the characteristics of real-world blurring trajectories with a learnable wavelet transform module to focus on the directional continuity and frequency features of the step-by-step transitions between blurred images to sharp images. In conclusion we propose a multi-scale network with a learnable discrete wavelet transform (MLWNet) which exhibits state-of-the-art performance on multiple real-world deblurred datasets in terms of both subjective and objective quality as well as computational efficiency.

MaskPLAN: Masked Generative Layout Planning from Partial Input
Hang Zhang, Anton Savov, Benjamin Dillenburger; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 8964-8973
Layout planning spanning from architecture to interior design is a slow iterative exploration of ill-defined problems adopting a "I'll know it when I see it" approach to potential solutions. Recent advances in generative models promise automating layout generation yet often overlook the crucial role of user-guided iteration cannot generate full solutions from incomplete design ideas and do not learn for the inter-dependency of layout attributes. To address these limitations we propose MaskPLAN a novel generative model based on Graph-structured Dynamic Masked Autoencoders (GDMAE) featuring five transformers generating a blend of graph-based and image-based layout attributes. MaskPLAN lets users generate and adjust layouts with partial attribute definitions create alternatives for preferences and practice new composition-driven or functionality-driven workflows. Through cross-attribute learning and the user input as a global conditional prior we ensure that design synthesis is calibrated at every intermediate stage maintaining its feasibility and practicality. Extensive evaluations show MaskPLAN's superior performance over existing methods across multiple metrics.

Benchmarking the Robustness of Temporal Action Detection Models Against Temporal Corruptions
Runhao Zeng, Xiaoyong Chen, Jiaming Liang, Huisi Wu, Guangzhong Cao, Yong Guo; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 18263-18274
Temporal action detection (TAD) aims to locate action positions and recognize action categories in long-term untrimmed videos. Although many methods have achieved promising results their robustness has not been thoroughly studied. In practice we observe that temporal information in videos can be occasionally corrupted such as missing or blurred frames. Interestingly existing methods often incur a significant performance drop even if only one frame is affected. To formally evaluate the robustness we establish two temporal corruption robustness benchmarks namely THUMOS14-C and ActivityNet-v1.3-C. In this paper we extensively analyze the robustness of seven leading TAD methods and obtain some interesting findings: 1) Existing methods are particularly vulnerable to temporal corruptions and end-to-end methods are often more susceptible than those with a pre-trained feature extractor; 2) Vulnerability mainly comes from localization error rather than classification error; 3) When corruptions occur in the middle of an action instance TAD models tend to yield the largest performance drop. Besides building a benchmark we further develop a simple but effective robust training method to defend against temporal corruptions through the FrameDrop augmentation and Temporal-Robust Consistency loss. Remarkably our approach not only improves robustness but also yields promising improvements on clean data. We believe that this study will serve as a benchmark for future research in robust video analysis. Source code and models are available at https://github.com/Alvin-Zeng/temporal-robustness-benchmark.

Open-World Human-Object Interaction Detection via Multi-modal Prompts
Jie Yang, Bingliang Li, Ailing Zeng, Lei Zhang, Ruimao Zhang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp

. 16954-16964
In this paper we develop MP-HOI a powerful Multi-modal Prompt-based HOI detector designed to leverage both textual descriptions for open-set generalization and visual exemplars for handling high ambiguity in descriptions realizing HOI detection in the open world. Specifically it integrates visual prompts into existing language-guided-only HOI detectors to handle situations where textual descriptions face difficulties in generalization and to address complex scenarios with high interaction ambiguity. To facilitate MP-HOI training we build a large-scale HOI dataset named Magic-HOI which gathers six existing datasets into a unified label space forming over 186K images with 2.4K objects 1.2K actions and 20K HOI interactions. Furthermore to tackle the long-tail issue within the Magic-HOI dataset we introduce an automated pipeline for generating realistically annotated HOI images and present SynHOI a high-quality synthetic HOI dataset containing 100K images. Leveraging these two datasets MP-HOI optimizes the HOI task as a similarity learning process between multi-modal prompts and objects/interactions via a unified contrastive loss to learn generalizable and transferable objects/interactions representations from large-scale data. MP-HOI could serve as a generalist HOI detector surpassing the HOI vocabulary of existing expert models by more than 30 times. Concurrently our results demonstrate that MP-HOI exhibits remarkable zero-shot capability in real-world scenarios and consistently achieves a new state-of-the-art performance across various benchmarks. Our project homepage is available at https://MP-HOI.github.io/.

HMD-Poser: On-Device Real-time Human Motion Tracking from Scalable Sparse Observations
Peng Dai, Yang Zhang, Tao Liu, Zhen Fan, Tianyuan Du, Zhuo Su, Xiaozheng Zheng, Zeming Li; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 874-884
It is especially challenging to achieve real-time human motion tracking on a standalone VR Head-Mounted Display (HMD) such as Meta Quest and PICO. In this paper we propose HMD-Poser the first unified approach to recover full-body motions using scalable sparse observations from HMD and body-worn IMUs. In particular it can support a variety of input scenarios such as HMD HMD+2IMUs HMD+3IMUs etc. The scalability of inputs may accommodate users' choices for both high tracking accuracy and easy-to-wear. A lightweight temporal-spatial feature learning network is proposed in HMD-Poser to guarantee that the model runs in real-time on HMDs. Furthermore HMD-Poser presents online body shape estimation to improve the position accuracy of body joints. Extensive experimental results on the challenging AMASS dataset show that HMD-Poser achieves new state-of-the-art results in both accuracy and real-time performance. We also build a new free-dancing motion dataset to evaluate HMD-Poser's on-device performance and investigate the performance gap between synthetic data and real-captured sensor data. Finally we demonstrate our HMD-Poser with a real-time Avatar-driving application on a commercial HMD. Our code and free-dancing motion dataset are available \href https://pico-ai-team.github.io/hmd-poser here .

UniMODE: Unified Monocular 3D Object Detection
Zhuoling Li, Xiaogang Xu, SerNam Lim, Hengshuang Zhao; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 16561-16570
Realizing unified monocular 3D object detection including both indoor and outdoor scenes holds great importance in applications like robot navigation. However involving various scenarios of data to train models poses challenges due to their significantly different characteristics e.g. diverse geometry properties and heterogeneous domain distributions. To address these challenges we build a detector based on the bird's-eye-view (BEV) detection paradigm where the explicit feature projection is beneficial to addressing the geometry learning ambiguity when employing multiple scenarios of data to train detectors. Then we split the classical BEV detection architecture into two stages and propose an uneven BEV grid design to handle the convergence instability caused by the aforementioned challeng

es. Moreover we develop a sparse BEV feature projection strategy to reduce computational cost and a unified domain alignment method to handle heterogeneous domains. Combining these techniques a unified detector UniMODE is derived which surpasses the previous state-of-the-art on the challenging Omni3D dataset (a large-scale dataset including both indoor and outdoor scenes) by 4.9% \rm AP_ 3D revealing the first successful generalization of a BEV detector to unified 3D object detection.
****
Sherpa3D: Boosting High-Fidelity Text-to-3D Generation via Coarse 3D Prior
Fangfu Liu, Diankun Wu, Yi Wei, Yongming Rao, Yueqi Duan; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 20763-20774
Recently 3D content creation from text prompts has demonstrated remarkable progress by utilizing 2D and 3D diffusion models. While 3D diffusion models ensure great multi-view consistency their ability to generate high-quality and diverse 3D assets is hindered by the limited 3D data. In contrast 2D diffusion models find a distillation approach that achieves excellent generalization and rich details without any 3D data. However 2D lifting methods suffer from inherent view-agnostic ambiguity thereby leading to serious multi-face Janus issues where text prompts fail to provide sufficient guidance to learn coherent 3D results. Instead of retraining a costly viewpoint-aware model we study how to fully exploit easily accessible coarse 3D knowledge to enhance the prompts and guide 2D lifting optimization for refinement. In this paper we propose Sherpa3D a new text-to-3D framework that achieves high-fidelity generalizability and geometric consistency simultaneously. Specifically we design a pair of guiding strategies derived from the coarse 3D prior generated by the 3D diffusion model: a structural guidance for geometric fidelity and a semantic guidance for 3D coherence. Employing the two types of guidance the 2D diffusion model enriches the 3D content with diversified and high-quality results. Extensive experiments show the superiority of our Sherpa3D over the state-of-the-art text-to-3D methods in terms of quality and 3D consistency.

Flexible Biometrics Recognition: Bridging the Multimodality Gap through Attention Alignment and Prompt Tuning
Leslie Ching Ow Tiong, Dick Sigmund, Chen-Hui Chan, Andrew Beng Jin Teoh; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 267-276
Periocular and face are complementary biometrics for identity management albeit with inherent limitations notably in scenarios involving occlusion due to sunglasses or masks. In response to these challenges we introduce Flexible Biometric Recognition (FBR) a novel framework designed to advance conventional face periocular and multimodal face-periocular biometrics across both intra- and cross-modality recognition tasks. FBR strategically utilizes the Multimodal Fusion Attention (MFA) and Multimodal Prompt Tuning (MPT) mechanisms within the Vision Transformer architecture. MFA facilitates the fusion of modalities ensuring cohesive alignment between facial and periocular embeddings while incorporating soft-biometrics to enhance the model's ability to discriminate between individuals. The fusion of three modalities is pivotal in exploring interrelationships between different modalities. Additionally MPT serves as a unifying bridge intertwining inputs and promoting cross-modality interactions while preserving their distinctive characteristics. The collaborative synergy of MFA and MPT enhances the shared features of the face and periocular with a specific emphasis on the ocular region yielding exceptional performance in both intra- and cross-modality recognition tasks. Rigorous experimentation across four benchmark datasets validates the noteworthy performance of the FBR model. The source code is available at https://github.com/MIS-DevWorks/FBR.

Multi-agent Collaborative Perception via Motion-aware Robust Communication Network
Shixin Hong, Yu Liu, Zhi Li, Shaohui Li, You He; Proceedings of the IEEE/CVF Con

ference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 15301-15310
Collaborative perception allows for information sharing between multiple agents such as vehicles and infrastructure to obtain a comprehensive view of the enviro nment through communication and fusion. Current research on multi-agent collabor ative perception systems often assumes ideal communication and perception enviro nments and neglects the effect of real-world noise such as pose noise motion blu r and perception noise. To address this gap in this paper we propose a novel mot ion-aware robust communication network (MRCNet) that mitigates noise interferenc e and achieves accurate and robust collaborative perception. MRCNet consists of two main components: multi-scale robust fusion (MRF) addresses pose noise by dev eloping cross-semantic multi-scale enhanced aggregation to fuse features of diff erent scales while motion enhanced mechanism (MEM) captures motion context to co mpensate for information blurring caused by moving objects. Experimental results on popular collaborative 3D object detection datasets demonstrate that MRCNet o utperforms competing methods in noisy scenarios with improved perception perform ance using less bandwidth.
****
The Manga Whisperer: Automatically Generating Transcriptions for Comics
Ragav Sachdeva, Andrew Zisserman; Proceedings of the IEEE/CVF Conference on Comp uter Vision and Pattern Recognition (CVPR), 2024, pp. 12967-12976
In the past few decades Japanese comics commonly referred to as Manga have trans cended both cultural and linguistic boundaries to become a true worldwide sensat ion. Yet the inherent reliance on visual cues and illustration within manga rend ers it largely inaccessible to individuals with visual impairments. In this work we seek to address this substantial barrier with the aim of ensuring that manga can be appreciated and actively engaged by everyone. Specifically we tackle the problem of diarisation i.e. generating a transcription of who said what and whe n in a fully automatic way. To this end we make the following contributions: (1) we present a unified model Magi that is able to (a) detect panels text boxes an d character boxes (b) cluster characters by identity (without knowing the number of clusters apriori) and (c) associate dialogues to their speakers; (2) we prop ose a novel approach that is able to sort the detected text boxes in their readi ng order and generate a dialogue transcript; (3) we annotate an evaluation bench mark for this task using publicly available [English] manga pages.

Exploring Region-Word Alignment in Built-in Detector for Open-Vocabulary Object Detection
Heng Zhang, Qiuyu Zhao, Linyu Zheng, Hao Zeng, Zhiwei Ge, Tianhao Li, Sulong Xu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recogniti on (CVPR), 2024, pp. 16975-16984
Open-vocabulary object detection aims to detect novel categories that are indepe ndent from the base categories used during training. Most modern methods adhere to the paradigm of learning vision-language space from a large-scale multi-modal corpus and subsequently transferring the acquired knowledge to off-the-shelf de tectors like Faster-RCNN. However information attenuation or destruction may occ ur during the process of knowledge transfer due to the domain gap hampering the generalization ability on novel categories. To mitigate this predicament in this paper we present a novel framework named BIND standing for Bulit-IN Detector to eliminate the need for module replacement or knowledge transfer to off-the-shel f detectors. Specifically we design a two-stage training framework with an Encod er-Decoder structure. In the first stage an image-text dual encoder is trained t o learn region-word alignment from a corpus of image-text pairs. In the second s tage a DETR-style decoder is trained to perform detection on annotated object de tection datasets. In contrast to conventional manually designed non-adaptive anc hors which generate numerous redundant proposals we develop an anchor proposal n etwork that generates anchor proposals with high likelihood based on candidates adaptively thereby substantially improving detection efficiency. Experimental re sults on two public benchmarks COCO and LVIS demonstrate that our method stands as a state-of-the-art approach for open-vocabulary object detection.

MovieChat: From Dense Token to Sparse Memory for Long Video Understanding
Enxin Song, Wenhao Chai, Guanhong Wang, Yucheng Zhang, Haoyang Zhou, Feiyang Wu, Haozhe Chi, Xun Guo, Tian Ye, Yanting Zhang, Yan Lu, Jenq-Neng Hwang, Gaoang Wang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 18221-18232
Recently integrating video foundation models and large language models to build a video understanding system can overcome the limitations of specific pre-defined vision tasks. Yet existing systems can only handle videos with very few frames. For long videos the computation complexity memory cost and long-term temporal connection impose additional challenges. Taking advantage of the Atkinson-Shiffrin memory model with tokens in Transformers being employed as the carriers of memory in combination with our specially designed memory mechanism we propose the MovieChat to overcome these challenges. MovieChat achieves state-of-the-art performance in long video understanding along with the released MovieChat-1K benchmark with 1K long video and 14K manual annotations for validation of the effectiveness of our method. The code models and data can be found in https://rese1f.github.io/MovieChat.

Comparing the Decision-Making Mechanisms by Transformers and CNNs via Explanation Methods
Mingqi Jiang, Saeed Khorram, Li Fuxin; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 9546-9555
In order to gain insights about the decision-making of different visual recognition backbones we propose two methodologies sub-explanation counting and cross-testing that systematically applies deep explanation algorithms on a dataset-wide basis and compares the statistics generated from the amount and nature of the explanations. These methodologies reveal the difference among networks in terms of two properties called compositionality and disjunctivism. Transformers and ConvNeXt are found to be more compositional in the sense that they jointly consider multiple parts of the image in building their decisions whereas traditional CNNs and distilled transformers are less compositional and more disjunctive which means that they use multiple diverse but smaller set of parts to achieve a confident prediction. Through further experiments we pinpointed the choice of normalization to be especially important in the compositionality of a model in that batch normalization leads to less compositionality while group and layer normalization lead to more. Finally we also analyze the features shared by different backbones and plot a landscape of different models based on their feature-use similarity.

A Unified Diffusion Framework for Scene-aware Human Motion Estimation from Sparse Signals
Jiangnan Tang, Jingya Wang, Kaiyang Ji, Lan Xu, Jingyi Yu, Ye Shi; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 21251-21262
Estimating full-body human motion via sparse tracking signals from head-mounted displays and hand controllers in 3D scenes is crucial to applications in AR/VR. One of the biggest challenges to this task is the one-to-many mapping from sparse observations to dense full-body motions which endowed inherent ambiguities. To help resolve this ambiguous problem we introduce a new framework to combine rich contextual information provided by scenes to benefit full-body motion tracking from sparse observations. To estimate plausible human motions given sparse tracking signals and 3D scenes we develop \text S ^2Fusion a unified framework fusing \underline S cene and sparse \underline S ignals with a conditional dif\underline Fusion model. \text S ^2Fusion first extracts the spatial-temporal relations residing in the sparse signals via a periodic autoencoder and then produces time-alignment feature embedding as additional inputs. Subsequently by drawing initial noisy motion from a pre-trained prior \text S ^2Fusion utilizes conditional diffusion to fuse scene geometry and sparse tracking signals to generate full-body scene-aware motions. The sampling procedure of \text S ^2Fusion is further guided by a specially designed scene-penetration loss and phase-matching loss whi

ch effectively regularizes the motion of the lower body even in the absence of a
ny tracking signals making the generated motion much more plausible and coherent
. Extensive experimental results have demonstrated that our \text S ^2Fusion out
performs the state-of-the-art in terms of estimation quality and smoothness.

Single Domain Generalization for Crowd Counting
Zhuoxuan Peng, S.-H. Gary Chan; Proceedings of the IEEE/CVF Conference on Comput
er Vision and Pattern Recognition (CVPR), 2024, pp. 28025-28034
Due to its promising results density map regression has been widely employed for
 image-based crowd counting. The approach however often suffers from severe perf
ormance degradation when tested on data from unseen scenarios the so-called "dom
ain shift" problem. To address the problem we investigate in this work single do
main generalization (SDG) for crowd counting. The existing SDG approaches are ma
inly for image classification and segmentation and can hardly be extended to our
 case due to its regression nature and label ambiguity (i.e. ambiguous pixel-lev
el ground truths). We propose MPCount a novel effective SDG approach even for na
rrow source distribution. MPCount stores diverse density values for density map
regression and reconstructs domain-invariant features by means of only one memor
y bank a content error mask and attention consistency loss. By partitioning the
image into grids it employs patch-wise classification as an auxiliary task to mi
tigate label ambiguity. Through extensive experiments on different datasets MPCo
unt is shown to significantly improve counting accuracy compared to the state of
 the art under diverse scenarios unobserved in the training data characterized b
y narrow source distribution. Code is available at https://github.com/Shimmer93/
MPCount.

Atlantis: Enabling Underwater Depth Estimation with Stable Diffusion
Fan Zhang, Shaodi You, Yu Li, Ying Fu; Proceedings of the IEEE/CVF Conference on
 Computer Vision and Pattern Recognition (CVPR), 2024, pp. 11852-11861
Monocular depth estimation has experienced significant progress on terrestrial i
mages in recent years thanks to deep learning advancements. But it remains inade
quate for underwater scenes primarily due to data scarcity. Given the inherent c
hallenges of light attenuation and backscatter in water acquiring clear underwat
er images or precise depth is notably difficult and costly. To mitigate this iss
ue learning-based approaches often rely on synthetic data or turn to self- or un
supervised manners. Nonetheless their performance is often hindered by domain ga
p and looser constraints. In this paper we propose a novel pipeline for generati
ng photorealistic underwater images using accurate terrestrial depth. This appro
ach facilitates the supervised training of models for underwater depth estimatio
n effectively reducing the performance disparity between terrestrial and underwa
ter environments. Contrary to previous synthetic datasets that merely apply styl
e transfer to terrestrial images without scene content change our approach uniqu
ely creates vivid non-existent underwater scenes by leveraging terrestrial depth
 data through the innovative Stable Diffusion model. Specifically we introduce a
 specialized Depth2Underwater ControlNet trained on prepared \ Underwater Depth
Text\ data triplets for this generation task. Our newly developed dataset Atlan
tis enables terrestrial depth estimation models to achieve considerable improvem
ents on unseen underwater scenes surpassing their terrestrial pretrained counter
parts both quantitatively and qualitatively. Moreover we further show its practi
cal utility by applying the improved depth in underwater image enhancement and i
ts smaller domain gap from the LLVM perspective. Code and dataset are publicly a
vailable at https://github.com/zkawfanx/Atlantis.

Matching Anything by Segmenting Anything
Siyuan Li, Lei Ke, Martin Danelljan, Luigi Piccinelli, Mattia Segu, Luc Van Gool
, Fisher Yu; Proceedings of the IEEE/CVF Conference on Computer Vision and Patte
rn Recognition (CVPR), 2024, pp. 18963-18973
The robust association of the same objects across video frames in complex scenes
 is crucial for many applications especially object tracking. Current methods pr
edominantly rely on labeled domain-specific video datasets which limits cross-do

main generalization of learned similarity embeddings. We propose MASA a novel method for robust instance association learning capable of matching any objects within videos across diverse domains without tracking labels. Leveraging the rich object segmentation from the Segment Anything Model (SAM) MASA learns instance-level correspondence through exhausive data transformations. We treat the SAM outputs as dense object region proposals and learn to match those regions from a vast image collection. We further design a universal MASA adapter which can work in tandem with foundational segmentation or detection models and enable them to track any detected objects. Those combinations present strong zero-shot tracking ability in complex domains. Extensive tests on multiple challenging MOT and MOTS benchmarks indicate that the proposed method using only unlabelled static images achieves even better performance than state-of-the-art methods trained with fully annotated in-domain video sequences in zero-shot association. Our code is available at https://github.com/siyuanliii/masa.
****
Task-Aware Encoder Control for Deep Video Compression
Xingtong Ge, Jixiang Luo, Xinjie Zhang, Tongda Xu, Guo Lu, Dailan He, Jing Geng, Yan Wang, Jun Zhang, Hongwei Qin; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 26036-26045
Prior research on deep video compression (DVC) for machine tasks typically necessitates training a unique codec for each specific task mandating a dedicated decoder per task. In contrast traditional video codecs employ a flexible encoder controller enabling the adaptation of a single codec to different tasks through mechanisms like mode prediction. Drawing inspiration from this we introduce an innovative encoder controller for deep video compression for machines. This controller features a mode prediction and a Group of Pictures (GoP) selection module. Our approach centralizes control at the encoding stage allowing for adaptable encoder adjustments across different tasks such as detection and tracking while maintaining compatibility with a standard pre-trained DVC decoder. Empirical evidence demonstrates that our method is applicable across multiple tasks with various existing pre-trained DVCs. Moreover extensive experiments demonstrate that our method outperforms previous DVC by about 25% bitrate for different tasks with only one pre-trained decoder.

Multi-scale Dynamic and Hierarchical Relationship Modeling for Facial Action Units Recognition
Zihan Wang, Siyang Song, Cheng Luo, Songhe Deng, Weicheng Xie, Linlin Shen; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 1270-1280
Human facial action units (AUs) are mutually related in a hierarchical manner as not only they are associated with each other in both spatial and temporal domains but also AUs located in the same/close facial regions show stronger relationships than those of different facial regions. While none of existing approach thoroughly model such hierarchical inter-dependencies among AUs this paper proposes to comprehensively model multi-scale AU-related dynamic and hierarchical spatio-temporal relationship among AUs for their occurrences recognition. Specifically we first propose a novel multi-scale temporal differencing network with an adaptive weighting block to explicitly capture facial dynamics across frames at different spatial scales which specifically considers the heterogeneity of range and magnitude in different AUs' activation. Then a two-stage strategy is introduced to hierarchically model the relationship among AUs based on their spatial distribution (i.e. local and cross-region AU relationship modelling). Experimental results achieved on BP4D and DISFA show that our approach is the new state-of-the-art in the field of AU occurrence recognition. Our code is publicly available at https://github.com/CVI-SZU/MDHR.

Decoupled Pseudo-labeling for Semi-Supervised Monocular 3D Object Detection
Jiacheng Zhang, Jiaming Li, Xiangru Lin, Wei Zhang, Xiao Tan, Junyu Han, Errui Ding, Jingdong Wang, Guanbin Li; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 16923-16932

We delve into pseudo-labeling for semi-supervised monocular 3D object detection (SSM3OD) and discover two primary issues: a misalignment between the prediction quality of 3D and 2D attributes and the tendency of depth supervision derived fr om pseudo-labels to be noisy leading to significant optimization conflicts with other reliable forms of supervision. To tackle these issues we introduce a novel decoupled pseudo-labeling (DPL) approach for SSM3OD. Our approach features a De coupled Pseudo-label Generation (DPG) module designed to efficiently generate ps eudo-labels by separately processing 2D and 3D attributes. This module incorpora tes a unique homography-based method for identifying dependable pseudo-labels in Bird's Eye View (BEV) space specifically for 3D attributes. Additionally we pre sent a Depth Gradient Projection (DGP) module to mitigate optimization conflicts caused by noisy depth supervision of pseudo-labels effectively decoupling the d epth gradient and removing conflicting gradients. This dual decoupling strategy--at both the pseudo-label generation and gradient levels--significantly improves the utilization of pseudo-labels in SSM3OD. Our comprehensive experiments on th e KITTI benchmark demonstrate the superiority of our method over existing approa ches.
****
Temporally Consistent Unbalanced Optimal Transport for Unsupervised Action Segme ntation
Ming Xu, Stephen Gould; Proceedings of the IEEE/CVF Conference on Computer Visio n and Pattern Recognition (CVPR), 2024, pp. 14618-14627
We propose a novel approach to the action segmentation task for long untrimmed v ideos based on solving an optimal transport problem. By encoding a temporal cons istency prior into a Gromov-Wasserstein problem we are able to decode a temporal ly consistent segmentation from a noisy affinity/matching cost matrix between vi deo frames and action classes. Unlike previous approaches our method does not re quire knowing the action order for a video to attain temporal consistency. Furth ermore our resulting (fused) Gromov-Wasserstein problem can be efficiently solve d on GPUs using a few iterations of projected mirror descent. We demonstrate the effectiveness of our method in an unsupervised learning setting where our metho d is used to generate pseudo-labels for self-training. We evaluate our segmentat ion approach and unsupervised learning pipeline on the Breakfast 50-Salads YouTu be Instructions and Desktop Assembly datasets yielding state-of-the-art results for the unsupervised video action segmentation task.
****
Learning Transferable Negative Prompts for Out-of-Distribution Detection
Tianqi Li, Guansong Pang, Xiao Bai, Wenjun Miao, Jin Zheng; Proceedings of the I EEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 17584-17594
Existing prompt learning methods have shown certain capabilities in Out-of-Distr ibution (OOD) detection but the lack of OOD images in the target dataset in thei r training can lead to mismatches between OOD images and In-Distribution (ID) ca tegories resulting in a high false positive rate. To address this issue we intro duce a novel OOD detection method named 'NegPrompt' to learn a set of negative p rompts each representing a negative connotation of a given class label for delin eating the boundaries between ID and OOD images. It learns such negative prompts with ID data only without any reliance on external outlier data. Further curren t methods assume the availability of samples of all ID classes rendering them in effective in open-vocabulary learning scenarios where the inference stage can co ntain novel ID classes not present during training. In contrast our learned nega tive prompts are transferable to novel class labels. Experiments on various Imag eNet benchmarks show that NegPrompt surpasses state-of-the-art prompt-learning-b ased OOD detection methods and maintains a consistent lead in hard OOD detection in closed- and open-vocabulary classification scenarios. Code is available at h ttps://github.com/mala-lab/negprompt.
****
Long-Tail Class Incremental Learning via Independent Sub-prototype Construction
Xi Wang, Xu Yang, Jie Yin, Kun Wei, Cheng Deng; Proceedings of the IEEE/CVF Conf erence on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 28598-28607

Long-tail class incremental learning (LT-CIL) is designed to perpetually acquire novel knowledge from an imbalanced and perpetually evolving data stream while ensuring the retention of previously acquired knowledge. The existing method only re-balances data distribution and ignores exploring the potential relationship between different samples causing non-robust representations and even severe forgetting in classes with few samples. In this paper we constructed two parallel spaces simultaneously: 1) Sub-prototype space and 2) Reminiscence space to learn robust representations while alleviating forgetfulness. Concretely we advance the concept of the sub-prototype space which amalgamates insights from diverse classes. This integration facilitates the mutual complementarity of varied knowledge thereby augmenting the attainment of more robust representations. Furthermore we introduce the reminiscence space which encapsulates each class distribution aiming to constraint model optimization and mitigate the phenomenon of forgetting. The tandem utilization of the two parallel spaces effectively alleviates the adverse consequences associated with imbalanced data distribution preventing forgetting without needing replay examples. Extensive experiments demonstrate that our method achieves state-of-the-art performance on various benchmarks.
****
Learning with Unreliability: Fast Few-shot Voxel Radiance Fields with Relative Geometric Consistency
Yingjie Xu, Bangzhen Liu, Hao Tang, Bailin Deng, Shengfeng He; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 20342-20351
We propose a voxel-based optimization framework ReVoRF for few-shot radiance fields that strategically addresses the unreliability in pseudo novel view synthesis. Our method pivots on the insight that relative depth relationships within neighboring regions are more reliable than the absolute color values in disoccluded areas. Consequently we devise a bilateral geometric consistency loss that carefully navigates the trade-off between color fidelity and geometric accuracy in the context of depth consistency for uncertain regions. Moreover we present a reliability-guided learning strategy to discern and utilize the variable quality across synthesized views complemented by a reliability-aware voxel smoothing algorithm that smoothens the transition between reliable and unreliable data patches. Our approach allows for a more nuanced use of all available data promoting enhanced learning from regions previously considered unsuitable for high-quality reconstruction. Extensive experiments across diverse datasets reveal that our approach attains significant gains in efficiency and accuracy delivering rendering speeds of 3 FPS 7 mins to train a 360deg scene and a 5% improvement in PSNR over existing few-shot methods. Code is available at https://github.com/HKCLynn/ReVoRF

Towards Understanding and Improving Adversarial Robustness of Vision Transformers
Samyak Jain, Tanima Dutta; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 24736-24745
Recent literature has demonstrated that vision transformers (VITs) exhibit superior performance compared to convolutional neural networks (CNNs). The majority of recent research on adversarial robustness however has predominantly focused on CNNs. In this work we bridge this gap by analyzing the effectiveness of existing attacks on VITs. We demonstrate that due to the softmax computations in every attention block in VITs they are inherently vulnerable to floating point underflow errors. This can lead to a gradient masking effect resulting in suboptimal attack strength of well-known attacks like PGD Carlini and Wagner (CW) GAMA and Patch attacks. Motivated by this we propose Adaptive Attention Scaling (AAS) attack that can automatically find the optimal scaling factors of pre-softmax outputs using gradient-based optimization. We show that the proposed simple strategy can be incorporated with any existing adversarial attacks as well as adversarial training methods and achieved improved performance. On VIT-B16 we demonstrate an improved attack strength of upto 2.2% on CIFAR10 and upto 2.9% on CIFAR100 by incorporating the proposed AAS attack with state-of-the-art single attack methods like GAMA attack. Further we utilise the proposed AAS attack for every few epoch

s in existing adversarial training methods which is termed as Adaptive Attention Scaling Adversarial Training (AAS-AT). On incorporating AAS-AT with existing methods we outperform them on VITs over 1.3-3.5% on CIFAR10. We observe improved performance on ImageNet-100 as well.

EventEgo3D: 3D Human Motion Capture from Egocentric Event Streams
Christen Millerdurai, Hiroyasu Akada, Jian Wang, Diogo Luvizon, Christian Theobalt, Vladislav Golyanik; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 1186-1195
Monocular egocentric 3D human motion capture is a challenging and actively researched problem. Existing methods use synchronously operating visual sensors (e.g. RGB cameras) and often fail under low lighting and fast motions which can be restricting in many applications involving head-mounted devices. In response to the existing limitations this paper 1) introduces a new problem i.e. 3D human motion capture from an egocentric monocular event camera with a fisheye lens and 2) proposes the first approach to it called EventEgo3D (EE3D). Event streams have high temporal resolution and provide reliable cues for 3D human motion capture under high-speed human motions and rapidly changing illumination. The proposed EE3D framework is specifically tailored for learning with event streams in the LNES representation enabling high 3D reconstruction accuracy. We also design a prototype of a mobile head-mounted device with an event camera and record a real dataset with event observations and the ground-truth 3D human poses (in addition to the synthetic dataset). Our EE3D demonstrates robustness and superior 3D accuracy compared to existing solutions across various challenging experiments while supporting real-time 3D pose update rates of 140Hz.

Holistic Features are almost Sufficient for Text-to-Video Retrieval
Kaibin Tian, Ruixiang Zhao, Zijie Xin, Bangxiang Lan, Xirong Li; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 17138-17147
For text-to-video retrieval (T2VR) which aims to retrieve unlabeled videos by ad-hoc textual queries CLIP-based methods currently lead the way. Compared to CLIP4Clip which is efficient and compact state-of-the-art models tend to compute video-text similarity through fine-grained cross-modal feature interaction and matching putting their scalability for large-scale T2VR applications into doubt. We propose TeachCLIP enabling a CLIP4Clip based student network to learn from more advanced yet computationally intensive models. In order to create a learning channel to convey fine-grained cross-modal knowledge from a heavy model to the student we add to CLIP4Clip a simple Attentional frame-Feature Aggregation (AFA) block which by design adds no extra storage / computation overhead at the retrieval stage. Frame-text relevance scores calculated by the teacher network are used as soft labels to supervise the attentive weights produced by AFA. Extensive experiments on multiple public datasets justify the viability of the proposed method. TeachCLIP has the same efficiency and compactness as CLIP4Clip yet has near-SOTA effectiveness.

A Call to Reflect on Evaluation Practices for Age Estimation: Comparative Analysis of the State-of-the-Art and a Unified Benchmark
Jakub Paplhám, Vojt?ch Franc; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 1196-1205
Comparing different age estimation methods poses a challenge due to the unreliability of published results stemming from inconsistencies in the benchmarking process. Previous studies have reported continuous performance improvements over the past decade using specialized methods; however our findings challenge these claims. This paper identifies two trivial yet persistent issues with the currently used evaluation protocol and describes how to resolve them. We offer an extensive comparative analysis for state-of-the-art facial age estimation methods. Surprisingly we find that the performance differences between the methods are negligible compared to the effect of other factors such as facial alignment facial coverage image resolution model architecture or the amount of data used for pretrai

ning. We use the gained insights to propose using FaRL as the backbone model and demonstrate its effectiveness on all public datasets. We make the source code and exact data splits public on GitHub and in the supplementary material.
****
CosalPure: Learning Concept from Group Images for Robust Co-Saliency Detection
Jiayi Zhu, Qing Guo, Felix Juefei-Xu, Yihao Huang, Yang Liu, Geguang Pu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 3669-3678
Co-salient object detection (CoSOD) aims to identify the common and salient (usually in the foreground) regions across a given group of images. Although achieving significant progress state-of-the-art CoSODs could be easily affected by some adversarial perturbations leading to substantial accuracy reduction. The adversarial perturbations can mislead CoSODs but do not change the high-level semantic information (e.g. concept) of the co-salient objects. In this paper we propose a novel robustness enhancement framework by first learning the concept of the co-salient objects based on the input group images and then leveraging this concept to purify adversarial perturbations which are subsequently fed to CoSODs for robustness enhancement. Specifically we propose CosalPure containing two modules i.e. group-image concept learning and concept-guided diffusion purification. For the first module we adopt a pre-trained text-to-image diffusion model to learn the concept of co-salient objects within group images where the learned concept is robust to adversarial examples. For the second module we map the adversarial image to the latent space and then perform diffusion generation by embedding the learned concept into the noise prediction function as an extra condition. Our method can effectively alleviate the influence of the SOTA adversarial attack containing different adversarial patterns including exposure and noise. The extensive results demonstrate that our method could enhance the robustness of CoSODs significantly.

Uncertainty-aware Action Decoupling Transformer for Action Anticipation
Hongji Guo, Nakul Agarwal, Shao-Yuan Lo, Kwonjoon Lee, Qiang Ji; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 18644-18654
Human action anticipation aims at predicting what people will do in the future based on past observations. In this paper we introduce Uncertainty-aware Action Decoupling Transformer (UADT) for action anticipation. Unlike existing methods that directly predict action in a verb-noun pair format we decouple the action anticipation task into verb and noun anticipations separately. The objective is to make the two decoupled tasks assist each other and eventually improve the action anticipation task. Specifically we propose a two-stream Transformer-based architecture which is composed of a verb-to-noun model and a noun-to-verb model. The verb-to-noun model leverages the verb information to improve the noun prediction and the other way around. We extend the model in a probabilistic manner and quantify the predictive uncertainty of each decoupled task to select features. In this way the noun prediction leverages the most informative and redundancy-free verb features and verb prediction works similarly. Finally the two streams are combined dynamically based on their uncertainties to make the joint action anticipation. We demonstrate the efficacy of our method by achieving state-of-the-art performance on action anticipation benchmarks including EPIC-KITCHENS EGTEA Gaze+ and 50-Salads.
****
MRFP: Learning Generalizable Semantic Segmentation from Sim-2-Real with Multi-Resolution Feature Perturbation
Sumanth Udupa, Prajwal Gurunath, Aniruddh Sikdar, Suresh Sundaram; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 5904-5914
Deep neural networks have shown exemplary performance on semantic scene understanding tasks on source domains but due to the absence of style diversity during training enhancing performance on unseen target domains using only single source domain data remains a challenging task. Generation of simulated data is a feasib

le alternative to retrieving large style-diverse real-world datasets as it is a cumbersome and budget-intensive process. However the large domain-specific inconsistencies between simulated and real-world data pose a significant generalization challenge in semantic segmentation. In this work to alleviate this problem we propose a novel Multi-Resolution Feature Perturbation (MRFP) technique to randomize domain-specific fine-grained features and perturb style of coarse features. Our experimental results on various urban-scene segmentation datasets clearly indicate that along with the perturbation of style-information perturbation of fine-feature components is paramount to learn domain invariant robust feature maps for semantic segmentation models. MRFP is a simple and computationally efficient transferable module with no additional learnable parameters or objective functions that helps state-of-the-art deep neural networks to learn robust domain invariant features for simulation-to-real semantic segmentation. Code is available at https://github.com/airl-iisc/MRFP.

S-DyRF: Reference-Based Stylized Radiance Fields for Dynamic Scenes
Xingyi Li, Zhiguo Cao, Yizheng Wu, Kewei Wang, Ke Xian, Zhe Wang, Guosheng Lin; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 20102-20112
Current 3D stylization methods often assume static scenes which violates the dynamic nature of our real world. To address this limitation we present S-DyRF a reference-based spatio-temporal stylization method for dynamic neural radiance fields. However stylizing dynamic 3D scenes is inherently challenging due to the limited availability of stylized reference images along the temporal axis. Our key insight lies in introducing additional temporal cues besides the provided reference. To this end we generate temporal pseudo-references from the given stylized reference. These pseudo-references facilitate the propagation of style information from the reference to the entire dynamic 3D scene. For coarse style transfer we enforce novel views and times to mimic the style details present in pseudo-references at the feature level. To preserve high-frequency details we create a collection of stylized temporal pseudo-rays from temporal pseudo-references. These pseudo-rays serve as detailed and explicit stylization guidance for achieving fine style transfer. Experiments on both synthetic and real-world datasets demonstrate that our method yields plausible stylized results of space-time view synthesis on dynamic 3D scenes.

MotionEditor: Editing Video Motion via Content-Aware Diffusion
Shuyuan Tu, Qi Dai, Zhi-Qi Cheng, Han Hu, Xintong Han, Zuxuan Wu, Yu-Gang Jiang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 7882-7891
Existing diffusion-based video editing models have made gorgeous advances for editing attributes of a source video over time but struggle to manipulate the motion information while preserving the original protagonist's appearance and background. To address this we propose MotionEditor the first diffusion model for video motion editing. MotionEditor incorporates a novel content-aware motion adapter into ControlNet to capture temporal motion correspondence. While ControlNet enables direct generation based on skeleton poses it encounters challenges when modifying the source motion in the inverted noise due to contradictory signals between the noise (source) and the condition (reference). Our adapter complements ControlNet by involving source content to transfer adapted control signals seamlessly. Further we build up a two-branch architecture (a reconstruction branch and an editing branch) with a high-fidelity attention injection mechanism facilitating branch interaction. This mechanism enables the editing branch to query the key and value from the reconstruction branch in a decoupled manner making the editing branch retain the original background and protagonist appearance. We also propose a skeleton alignment algorithm to address the discrepancies in pose size and position. Experiments demonstrate the promising motion editing ability of MotionEditor both qualitatively and quantitatively. To the best of our knowledge MotionEditor is the first to use diffusion models specifically for video motion editing considering the origin dynamic background and camera movement.

What How and When Should Object Detectors Update in Continually Changing Test Do
mains?
Jayeon Yoo, Dongkwan Lee, Inseop Chung, Donghyun Kim, Nojun Kwak; Proceedings of
 the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024
, pp. 23354-23363
It is a well-known fact that the performance of deep learning models deteriorate
s when they encounter a distribution shift at test time. Test-time adaptation (T
TA) algorithms have been proposed to adapt the model online while inferring test
 data. However existing research predominantly focuses on classification tasks t
hrough the optimization of batch normalization layers or classification heads bu
t this approach limits its applicability to various model architectures like Tra
nsformers and makes it challenging to apply to other tasks such as object detect
ion. In this paper we propose a novel online adaption approach for object detect
ion in continually changing test domains considering which part of the model to
update how to update it and when to perform the update. By introducing architect
ure-agnostic and lightweight adaptor modules and only updating these while leavi
ng the pre-trained backbone unchanged we can rapidly adapt to new test domains i
n an efficient way and prevent catastrophic forgetting. Furthermore we present a
 practical and straightforward class-wise feature aligning method for object det
ection to resolve domain shifts. Additionally we enhance efficiency by determini
ng when the model is sufficiently adapted or when additional adaptation is neede
d due to changes in the test distribution. Our approach surpasses baselines on w
idely used benchmarks achieving improvements of up to 4.9%p and 7.9%p in mAP for
 COCO ? COCO-corrupted and SHIFT respectively while maintaining about 20 FPS or
higher. The implementation code is available at https://github.com/natureyoo/Con
tinualTTA_ObjectDetection.

One-Prompt to Segment All Medical Images
Junde Wu, Min Xu; Proceedings of the IEEE/CVF Conference on Computer Vision and
Pattern Recognition (CVPR), 2024, pp. 11302-11312
Large foundation models known for their strong zero-shot generalization have exc
elled in visual and language applications. However applying them to medical imag
e segmentation a domain with diverse imaging types and target labels remains an
open challenge. Current approaches such as adapting interactive segmentation mod
els like Segment Anything Model (SAM) require user prompts for each sample durin
g inference. Alternatively transfer learning methods like few/one-shot models de
mand labeled samples leading to high costs. This paper introduces a new paradigm
 toward the universal medical image segmentation termed 'One-Prompt Segmentation
.' One-Prompt Segmentation combines the strengths of one-shot and interactive me
thods. In the inference stage with just one prompted sample it can adeptly handl
e the unseen task in a single forward pass. We train One-Prompt Model on 64 open
-source medical datasets accompanied by the collection of over 3000 clinician-la
beled prompts. Tested on 14 previously unseen datasets the One-Prompt Model show
cases superior zero-shot segmentation capabilities outperforming a wide range of
 related methods. The code and data is released as https://github.com/KidsWithTo
kens/one-prompt.

Bayesian Exploration of Pre-trained Models for Low-shot Image Classification
Yibo Miao, Yu Lei, Feng Zhou, Zhijie Deng; Proceedings of the IEEE/CVF Conferenc
e on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 23849-23859
Low-shot image classification is a fundamental task in computer vision and the e
mergence of large-scale vision-language models such as CLIP has greatly advanced
 the forefront of research in this field. However most existing CLIP-based metho
ds lack the flexibility to effectively incorporate other pre-trained models that
 encompass knowledge distinct from CLIP. To bridge the gap this work proposes a
simple and effective probabilistic model ensemble framework based on Gaussian pr
ocesses which have previously demonstrated remarkable efficacy in processing sma
ll data. We achieve the integration of prior knowledge by specifying the mean fu
nction with CLIP and the kernel function with an ensemble of deep kernels built

upon various pre-trained models. By regressing the classification label directly our framework enables analytical inference straightforward uncertainty quantification and principled hyper-parameter tuning. Through extensive experiments on standard benchmarks we demonstrate that our method consistently outperforms competitive ensemble baselines regarding predictive performance. Additionally we assess the robustness of our method and the quality of the yielded uncertainty estimates on out-of-distribution datasets. We also illustrate that our method despite relying on label regression still enjoys superior model calibration compared to most deterministic baselines.
****
GROUNDHOG: Grounding Large Language Models to Holistic Segmentation
Yichi Zhang, Ziqiao Ma, Xiaofeng Gao, Suhaila Shakiah, Qiaozi Gao, Joyce Chai; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 14227-14238
Most multimodal large language models (MLLMs) learn language-to-object grounding through causal language modeling where grounded objects are captured by bounding boxes as sequences of location tokens. This paradigm lacks pixel-level representations that are important for fine-grained visual understanding and diagnosis. In this work we introduce GROUNDHOG an MLLM developed by grounding Large Language Models to holistic segmentation. GROUNDHOG incorporates a masked feature extractor and converts extracted features into visual entity tokens for the MLLM backbone which then connects groundable phrases to unified grounding masks by retrieving and merging the entity masks. To train GROUNDHOG we carefully curated M3G2 a grounded visual instruction tuning dataset with Multi-Modal Multi-Grained Grounding by harvesting a collection of segmentation-grounded datasets with rich annotations. Our experimental results show that GROUNDHOG achieves superior performance on various language grounding tasks without task-specific fine-tuning and significantly reduces object hallucination. GROUNDHOG also demonstrates better grounding towards complex forms of visual input and provides easy-to-understand diagnosis in failure cases.

Doubly Abductive Counterfactual Inference for Text-based Image Editing
Xue Song, Jiequan Cui, Hanwang Zhang, Jingjing Chen, Richang Hong, Yu-Gang Jiang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 9162-9171
We study text-based image editing (TBIE) of a single image by counterfactual inference because it is an elegant formulation to precisely address the requirement: the edited image should retain the fidelity of the original one. Through the lens of the formulation we find that the crux of TBIE is that existing techniques hardly achieve a good trade-off between editability and fidelity mainly due to the overfitting of the single-image fine-tuning. To this end we propose a Doubly Abductive Counterfactual inference framework (DAC). We first parameterize an exogenous variable as a UNet LoRA whose abduction can encode all the image details. Second we abduct another exogenous variable parameterized by a text encoder LoRA which recovers the lost editability caused by the overfitted first abduction. Thanks to the second abduction which exclusively encodes the visual transition from post-edit to pre-edit its inversion---subtracting the LoRA---effectively reverts pre-edit back to post-edit thereby accomplishing the edit. Through extensive experiments our DAC achieves a good trade-off between editability and fidelity. Thus we can support a wide spectrum of user editing intents including addition removal manipulation replacement style transfer and facial change which are extensively validated in both qualitative and quantitative evaluations. Codes are in https://github.com/xuesong39/DAC.

RoMa: Robust Dense Feature Matching
Johan Edstedt, Qiyu Sun, Georg Bökman, Mårten Wadenbäck, Michael Felsberg; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 19790-19800
Feature matching is an important computer vision task that involves estimating correspondences between two images of a 3D scene and dense methods estimate all s

uch correspondences. The aim is to learn a robust model i.e. a model able to match under challenging real-world changes. In this work we propose such a model leveraging frozen pretrained features from the foundation model DINOv2. Although these features are significantly more robust than local features trained from scratch they are inherently coarse. We therefore combine them with specialized ConvNet fine features creating a precisely localizable feature pyramid. To further improve robustness we propose a tailored transformer match decoder that predicts anchor probabilities which enables it to express multimodality. Finally we propose an improved loss formulation through regression-by-classification with subsequent robust regression. We conduct a comprehensive set of experiments that show that our method RoMa achieves significant gains setting a new state-of-the-art. In particular we achieve a 36% improvement on the extremely challenging WxBS benchmark. Code is provided at github.com/Parskatt/RoMa.
****
Omni-SMoLA: Boosting Generalist Multimodal Models with Soft Mixture of Low-rank Experts
Jialin Wu, Xia Hu, Yaqing Wang, Bo Pang, Radu Soricut; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 14205-14215
In this work we present Omni-SMoLA a multimodal architecture that mixes many multi-modal experts efficiently and achieves both high specialist and generalist performance. In contrast to previous models for which we see performance degradation on average when training the models on a wide range of tasks we show that the SMoLA low-rank experts are able to model different skills and task and overall improve the performance of a generalist model. This finding indicates that simple LMM fine-tuning is suboptimal for handling a wide range of tasks and that pairing the act of fine-tuning with specifically-designed architecture changes leads to better performing models.
****
SeMoLi: What Moves Together Belongs Together
Jenny Seidenschwarz, Aljosa Osep, Francesco Ferroni, Simon Lucey, Laura Leal-Taixe; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 14685-14694
We tackle semi-supervised object detection based on motion cues. Recent results suggest that heuristic-based clustering methods in conjunction with object trackers can be used to pseudo-label instances of moving objects and use these as supervisory signals to train 3D object detectors in Lidar data without manual supervision. We re-think this approach and suggest that both object detection as well as motion-inspired pseudo-labeling can be tackled in a data-driven manner. We leverage recent advances in scene flow estimation to obtain point trajectories from which we extract long-term class-agnostic motion patterns. Revisiting correlation clustering in the context of message passing networks we learn to group those motion patterns to cluster points to object instances. By estimating the full extent of the objects we obtain per-scan 3D bounding boxes that we use to supervise a Lidar object detection network. Our method not only outperforms prior heuristic-based approaches (57.5 AP +14 improvement over prior work) more importantly we show we can pseudo-label and train object detectors across datasets.

Insights from the Use of Previously Unseen Neural Architecture Search Datasets
Rob Geada, David Towers, Matthew Forshaw, Amir Atapour-Abarghouei, A. Stephen McGough; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 22541-22550
The boundless possibility of neural networks which can be used to solve a problem - each with different performance - leads to a situation where a Deep Learning expert is required to identify the best neural network. This goes against the hope of removing the need for experts. Neural Architecture Search (NAS) offers a solution to this by automatically identifying the best architecture. However to date NAS work has focused on a small set of datasets which we argue are not representative of real-world problems. We introduce eight new datasets created for a series of NAS Challenges: AddNIST Language MultNIST CIFARTile Gutenberg Isabell

a GeoClassing and Chesseract. These datasets and challenges are developed to direct attention to issues in NAS development and to encourage authors to consider how their models will perform on datasets unknown to them at development time. We present experimentation using standard Deep Learning methods as well as the best results from challenge participants

Adversarially Robust Few-shot Learning via Parameter Co-distillation of Similarity and Class Concept Learners
Junhao Dong, Piotr Koniusz, Junxi Chen, Xiaohua Xie, Yew-Soon Ong; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 28535-28544
Few-shot learning (FSL) facilitates a variety of computer vision tasks yet remains vulnerable to adversarial attacks. Existing adversarially robust FSL methods rely on either visual similarity learning or class concept learning. Our analysis reveals that these two learning paradigms are complementary exhibiting distinct robustness due to their unique decision boundary types (concepts clustering by the visual similarity label vs. classification by the class labels). To bridge this gap we propose a novel framework unifying adversarially robust similarity learning and class concept learning. Specifically we distill parameters from both network branches into a "unified embedding model" during robust optimization and redistribute them to individual network branches periodically. To capture generalizable robustness across diverse branches we initialize adversaries in each episode with cross-branch class-wise "global adversarial perturbations" instead of less informative random initialization. We also propose a branch robustness harmonization to modulate the optimization of similarity and class concept learners via their relative adversarial robustness. Extensive experiments demonstrate the state-of-the-art performance of our method in diverse few-shot scenarios.

Context-Guided Spatio-Temporal Video Grounding
Xin Gu, Heng Fan, Yan Huang, Tiejian Luo, Libo Zhang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 18330-18339
Spatio-temporal video grounding (or STVG) task aims at locating a spatio-temporal tube for a specific instance given a text query. Despite advancements current methods easily suffer the distractors or heavy object appearance variations in videos due to insufficient object information from the text leading to degradation. Addressing this we propose a novel framework context-guided STVG (CG-STVG) which mines discriminative instance context for object in videos and applies it as a supplementary guidance for target localization. The key of CG-STVG lies in two specially designed modules including instance context generation (ICG) which focuses on discovering visual context information (in both appearance and motion) of the instance and instance context refinement (ICR) which aims to improve the instance context from ICG by eliminating irrelevant or even harmful information from the context. During grounding ICG together with ICR are deployed at each decoding stage of a Transformer architecture for instance context learning. Particularly instance context learned from one decoding stage is fed to the next stage and leveraged as a guidance containing rich and discriminative object feature to enhance the target-awareness in decoding feature which conversely benefits generating better new instance context for improving localization finally. Compared to existing methods CG-STVG enjoys object information in text query and guidance from mined instance visual context for more accurate target localization. In our experiments on three benchmarks including HCSTVG-v1/-v2 and VidSTG CG-STVG sets new state-of-the-arts in m_tIoU and m_vIoU on all of them showing efficacy. Code is released at https://github.com/HengLan/CGSTVG.

Explaining the Implicit Neural Canvas: Connecting Pixels to Neurons by Tracing their Contributions
Namitha Padmanabhan, Matthew Gwilliam, Pulkit Kumar, Shishira R Maiya, Max Ehrlich, Abhinav Shrivastava; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 10957-10967

The many variations of Implicit Neural Representations (INRs) where a neural net
work is trained as a continuous representation of a signal have tremendous pract
ical utility for downstream tasks including novel view synthesis video compressi
on and image super-resolution. Unfortunately the inner workings of these network
s are seriously understudied. Our work eXplaining the Implicit Neural Canvas (XI
NC) is a unified framework for explaining properties of INRs by examining the st
rength of each neuron's contribution to each output pixel. We call the aggregate
 of these contribution maps the Implicit Neural Canvas and we use this concept t
o demonstrate that the INRs we study learn to "see" the frames they represent in
 surprising ways. For example INRs tend to have highly distributed representatio
ns. While lacking high-level object semantics they have a significant bias for c
olor and edges and are almost entirely space-agnostic. We arrive at our conclusi
ons by examining how objects are represented across time in video INRs using clu
stering to visualize similar neurons across layers and architectures and show th
at this is dominated by motion. These insights demonstrate the general usefulnes
s of our analysis framework.

APISR: Anime Production Inspired Real-World Anime Super-Resolution
Boyang Wang, Fengyu Yang, Xihang Yu, Chao Zhang, Hanbin Zhao; Proceedings of the
 IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp
. 25574-25584
While real-world anime super-resolution (SR) has gained increasing attention in
the SR community existing methods still adopt techniques from the photorealistic
 domain. In this paper we analyze the anime production workflow and rethink how
to use characteristics of it for the sake of the real-world anime SR. First we a
rgue that video networks and datasets are not necessary for anime SR due to the
repetition use of hand-drawing frames. Instead we propose an anime image collect
ion pipeline by choosing the least compressed and the most informative frames fr
om the video sources. Based on this pipeline we introduce the Anime Production-o
riented Image (API) dataset. In addition we identify two anime-specific challeng
es of distorted and faint hand-drawn lines and unwanted color artifacts. We addr
ess the first issue by introducing a prediction-oriented compression module in t
he image degradation model and a pseudo-ground truth preparation with enhanced h
and-drawn lines. In addition we introduce the balanced twin perceptual loss comb
ining both anime and photorealistic high-level features to mitigate unwanted col
or artifacts and increase visual clarity. We evaluate our method through extensi
ve experiments on the public benchmark showing our method outperforms state-of-t
he-art anime dataset-trained approaches.

MVCPS-NeuS: Multi-view Constrained Photometric Stereo for Neural Surface Reconst
ruction
Hiroaki Santo, Fumio Okura, Yasuyuki Matsushita; Proceedings of the IEEE/CVF Con
ference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 20475-20484
Multi-view photometric stereo (MVPS) recovers a high-fidelity 3D shape of a scen
e by benefiting from both multi-view stereo and photometric stereo. While photom
etric stereo boosts detailed shape reconstruction it necessitates recording imag
es under various light conditions for each viewpoint. In particular calibrating
the light directions for each view significantly increases the cost of acquiring
 images. To make MVPS more accessible we introduce a practical and easy-to-imple
ment setup multi-view constrained photometric stereo (MVCPS) where the light dir
ections are unknown but constrained to move together with the camera. Unlike con
ventional multi-view uncalibrated photometric stereo our constrained setting red
uces the ambiguities of surface normal estimates from per-view linear ambiguitie
s to a single and global linear one thereby simplifying the disambiguation proce
ss. The proposed method integrates the ambiguous surface normal into neural surf
ace reconstruction (NeuS) to simultaneously resolve the global ambiguity and est
imate the detailed 3D shape. Experiments demonstrate that our method estimates a
ccurate shapes under sparse viewpoints using only a few multi-view constrained l
ight sources.

ULIP-2: Towards Scalable Multimodal Pre-training for 3D Understanding
Le Xue, Ning Yu, Shu Zhang, Artemis Panagopoulou, Junnan Li, Roberto Martín-Martín, Jiajun Wu, Caiming Xiong, Ran Xu, Juan Carlos Niebles, Silvio Savarese; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 27091-27101
Recent advancements in multimodal pre-training have shown promising efficacy in 3D representation learning by aligning multimodal features across 3D shapes their 2D counterparts and language descriptions. However the methods used by existing frameworks to curate such multimodal data in particular language descriptions for 3D shapes are not scalable and the collected language descriptions are not diverse. To address this we introduce ULIP-2 a simple yet effective tri-modal pre training framework that leverages large multimodal models to automatically generate holistic language descriptions for 3D shapes. It only needs 3D data as input eliminating the need for any manual 3D annotations and is therefore scalable to large datasets. ULIP-2 is also equipped with scaled-up backbones for better multi-modal representation learning. We conduct experiments on two large-scale 3D datasets Objaverse and ShapeNet and augment them with tri-modal datasets of 3D point clouds images and language for training ULIP-2. Experiments show that ULIP-2 demonstrates substantial benefits in three downstream tasks: zero-shot 3D classification standard 3D classification with fine-tuning and 3D captioning (3D-to-language generation). It achieves a new SOTA of 50.6% (top- 1) on Objaverse-LVIS and 84.7% (top-1) on ModelNet40 in zero-shot classification. In the ScanObjectNN benchmark for standard fine-tuning ULIP-2 reaches an overall accuracy of 91.5% with a compact model of only 1.4 million parameters. ULIP-2 sheds light on a new paradigm for scalable multimodal 3D representation learning without human annotations and shows significant improvements over existing baselines. The code and datasets are released at https://github.com/salesforce/ULIP.

Normalizing Flows on the Product Space of SO(3) Manifolds for Probabilistic Human Pose Modeling
Olaf Dünkel, Tim Salzmann, Florian Pfaff; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 2285-2294
Normalizing flows have proven their efficacy for density estimation in Euclidean space but their application to rotational representations crucial in various domains such as robotics or human pose modeling remains underexplored. Probabilistic models of the human pose can benefit from approaches that rigorously consider the rotational nature of human joints. For this purpose we introduce HuProSO3 a normalizing flow model that operates on a high-dimensional product space of SO(3) manifolds modeling the joint distribution for human joints with three degrees of freedom. HuProSO3's advantage over state-of-the-art approaches is demonstrated through its superior modeling accuracy in three different applications and its capability to evaluate the exact likelihood. This work not only addresses the technical challenge of learning densities on SO(3) manifolds but it also has broader implications for domains where the probabilistic regression of correlated 3D rotations is of importance. Code will be available at https://github.com/odunkel/HuProSO.
****
Adapting to Length Shift: FlexiLength Network for Trajectory Prediction
Yi Xu, Yun Fu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 15226-15237
Trajectory prediction plays an important role in various applications including autonomous driving robotics and scene understanding. Existing approaches mainly focus on developing compact neural networks to increase prediction precision on public datasets typically employing a standardized input duration. However a notable issue arises when these models are evaluated with varying observation lengths leading to a significant performance drop a phenomenon we term the Observation Length Shift. To address this issue we introduce a general and effective framework the FlexiLength Network (FLN) to enhance the robustness of existing trajectory prediction techniques against varying observation periods. Specifically FLN integrates trajectory data with diverse observation lengths incorporates FlexiLe

ngth Calibration (FLC) to acquire temporal invariant representations and employs FlexiLength Adaptation (FLA) to further refine these representations for more accurate future trajectory predictions. Comprehensive experiments on multiple datasets i.e. ETH/UCY nuScenes and Argoverse 1 demonstrate the effectiveness and flexibility of our proposed FLN framework.

WorDepth: Variational Language Prior for Monocular Depth Estimation
Ziyao Zeng, Daniel Wang, Fengyu Yang, Hyoungseob Park, Stefano Soatto, Dong Lao, Alex Wong; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 9708-9719
Three-dimensional (3D) reconstruction from a single image is an ill-posed problem with inherent ambiguities i.e. scale. Predicting a 3D scene from text description(s) is similarly ill-posed i.e. spatial arrangements of objects described. We investigate the question of whether two inherently ambiguous modalities can be used in conjunction to produce metric-scaled reconstructions. To test this we focus on monocular depth estimation the problem of predicting a dense depth map from a single image but with an additional text caption describing the scene. To this end we begin by encoding the text caption as a mean and standard deviation; using a variational framework we learn the distribution of the plausible metric reconstructions of 3D scenes corresponding to the text captions as a prior. To "select" a specific reconstruction or depth map we encode the given image through a conditional sampler that samples from the latent space of the variational text encoder which is then decoded to the output depth map. Our approach is trained alternatingly between the text and image branches: in one optimization step we predict the mean and standard deviation from the text description and sample from a standard Gaussian and in the other we sample using a (image) conditional sampler. Once trained we directly predict depth from the encoded text using the conditional sampler. We demonstrate our approach on indoor (NYUv2) and outdoor (KITTI) scenarios where we show that language can consistently improve performance in both. Code: https://github.com/Adonis-galaxy/WorDepth.

WaveMo: Learning Wavefront Modulations to See Through Scattering
Mingyang Xie, Haiyun Guo, Brandon Y. Feng, Lingbo Jin, Ashok Veeraraghavan, Christopher A. Metzler; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 25276-25285
Imaging through scattering media is a fundamental and pervasive challenge in fields ranging from medical diagnostics to astronomy. A promising strategy to overcome this challenge is wavefront modulation which induces measurement diversity during image acquisition. Despite its importance designing optimal wavefront modulations to image through scattering remains under-explored. This paper introduces a novel learning-based framework to address the gap. Our approach jointly optimizes wavefront modulations and a computationally lightweight feedforward "proxy" reconstruction network. This network is trained to recover scenes obscured by scattering using measurements that are modified by these modulations. The learned modulations produced by our framework generalize effectively to unseen scattering scenarios and exhibit remarkable versatility. During deployment the learned modulations can be decoupled from the proxy network to augment other more computationally expensive restoration algorithms. Through extensive experiments we demonstrate our approach significantly advances the state of the art in imaging through scattering media. Our project webpage is at https://wavemo-2024.github.io/.

ReGenNet: Towards Human Action-Reaction Synthesis
Liang Xu, Yizhou Zhou, Yichao Yan, Xin Jin, Wenhan Zhu, Fengyun Rao, Xiaokang Yang, Wenjun Zeng; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 1759-1769
Humans constantly interact with their surrounding environments. Current human-centric generative models mainly focus on synthesizing humans plausibly interacting with static scenes and objects while the dynamic human action-reaction synthesis for ubiquitous causal human-human interactions is less explored. Human-human interactions can be regarded as asymmetric with actors and reactors in atomic in

teraction periods. In this paper we comprehensively analyze the asymmetric dynamic synchronous and detailed nature of human-human interactions and propose the first multi-setting human action-reaction synthesis benchmark to generate human reactions conditioned on given human actions. To begin with we propose to annotate the actor-reactor order of the interaction sequences for the NTU120 InterHuman and Chi3D datasets. Based on them a diffusion-based generative model with a Transformer decoder architecture called ReGenNet together with an explicit distance-based interaction loss is proposed to predict human reactions in an online manner where the future states of actors are unavailable to reactors. Quantitative and qualitative results show that our method can generate instant and plausible human reactions compared to the baselines and can generalize to unseen actor motions and viewpoint changes.

A Simple Baseline for Efficient Hand Mesh Reconstruction
Zhishan Zhou, Shihao Zhou, Zhi Lv, Minqiang Zou, Yao Tang, Jiajun Liang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 1367-1376
Hand mesh reconstruction has attracted considerable attention in recent years with various approaches and techniques being proposed. Some of these methods incorporate complex components and designs which while effective may complicate the model and hinder efficiency. In this paper we decompose the mesh decoder into token generator and mesh regressor. Through extensive ablation experiments we found that the token generator should select discriminating and representative points while the mesh regressor needs to upsample sparse keypoints into dense meshes in multiple stages. Given these functionalities we can achieve high performance with minimal computational resources. Based on this observation we propose a simple yet effective baseline that outperforms state-of-the-art methods by a large margin while maintaining real-time efficiency. Our method outperforms existing solutions achieving state-of-the-art (SOTA) results across multiple datasets. On the FreiHAND dataset our approach produced a PA-MPJPE of 5.8mm and a PA-MPVPE of 6.1mm. Similarly on the DexYCB dataset we observed a PA-MPJPE of 5.5mm and a PA-MPVPE of 5.5mm. As for performance speed our method reached up to 33 frames per second (fps) when using HRNet and up to 70 fps when employing FastViT-MA36. Code will be made available.

Integrating Efficient Optimal Transport and Functional Maps For Unsupervised Shape Correspondence Learning
Tung Le, Khai Nguyen, Shanlin Sun, Nhat Ho, Xiaohui Xie; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 23188-23198
In the realm of computer vision and graphics accurately establishing correspondences between geometric 3D shapes is pivotal for applications like object tracking registration texture transfer and statistical shape analysis. Moving beyond traditional hand-crafted and data-driven feature learning methods we incorporate spectral methods with deep learning focusing on functional maps (FMs) and optimal transport (OT). Traditional OT-based approaches often reliant on entropy regularization OT in learning-based framework face computational challenges due to their quadratic cost. Our key contribution is to employ the sliced Wasserstein distance (SWD) for OT which is a valid fast optimal transport metric in an unsupervised shape matching framework. This unsupervised framework integrates functional map regularizers with a novel OT-based loss derived from SWD enhancing feature alignment between shapes treated as discrete probability measures. We also introduce an adaptive refinement process utilizing entropy regularized OT further refining feature alignments for accurate point-to-point correspondences. Our method demonstrates superior performance in non-rigid shape matching including near-isometric and non-isometric scenarios and excels in downstream tasks like segmentation transfer. The empirical results on diverse datasets highlight our framework's effectiveness and generalization capabilities setting new standards in non-rigid shape matching with efficient OT metrics and an adaptive refinement module.

PhotoMaker: Customizing Realistic Human Photos via Stacked ID Embedding
Zhen Li, Mingdeng Cao, Xintao Wang, Zhongang Qi, Ming-Ming Cheng, Ying Shan; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 8640-8650
Recent advances in text-to-image generation have made remarkable progress in synthesizing realistic human photos conditioned on given text prompts. However existing personalized generation methods cannot simultaneously satisfy the requirements of high efficiency promising identity (ID) fidelity and flexible text controllability. In this work we introduce PhotoMaker an efficient personalized text-to-image generation method which mainly encodes an arbitrary number of input ID images into a stack ID embedding for preserving ID information. Such an embedding also empowers our method to be applied in many interesting scenarios such as when replacing the corresponding class word and when combining the characteristics of different identities. Besides to better drive the training of our PhotoMaker we propose an ID-oriented data creation pipeline to assemble the training data. Under the nourishment of the dataset constructed through the proposed pipeline our PhotoMaker demonstrates comparable performance to test-time fine-tuning-based methods yet provides significant speed improvements strong generalization capabilities and a wide range of applications.

Score-Guided Diffusion for 3D Human Recovery
Anastasis Stathopoulos, Ligong Han, Dimitris Metaxas; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 906-915
We present Score-Guided Human Mesh Recovery (ScoreHMR) an approach for solving inverse problems for 3D human pose and shape reconstruction. These inverse problems involve fitting a human body model to image observations traditionally solved through optimization techniques. ScoreHMR mimics model fitting approaches but alignment with the image observation is achieved through score guidance in the latent space of a diffusion model. The diffusion model is trained to capture the conditional distribution of the human model parameters given an input image. By guiding its denoising process with a task-specific score ScoreHMR effectively solves inverse problems for various applications without the need for retraining the task-agnostic diffusion model. We evaluate our approach on three settings/applications. These are: (i) single-frame model fitting; (ii) reconstruction from multiple uncalibrated views; (iii) reconstructing humans in video sequences. ScoreHMR consistently outperforms all optimization baselines on popular benchmarks across all settings. We make our code and models available on the project website: https://statho.github.io/ScoreHMR.

Check Locate Rectify: A Training-Free Layout Calibration System for Text-to-Image Generation
Biao Gong, Siteng Huang, Yutong Feng, Shiwei Zhang, Yuyuan Li, Yu Liu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 6624-6634
Diffusion models have recently achieved remarkable progress in generating realistic images. However challenges remain in accurately understanding and synthesizing the layout requirements in the textual prompts. To align the generated image with layout instructions we present a training-free layout calibration system SimM that intervenes in the generative process on the fly during inference time. Specifically following a "check-locate-rectify" pipeline the system first analyses the prompt to generate the target layout and compares it with the intermediate outputs to automatically detect errors. Then by moving the located activations and making intra- and inter-map adjustments the rectification process can be performed with negligible computational overhead. To evaluate SimM over a range of layout requirements we present a benchmark SimMBench that compensates for the lack of superlative spatial relations in existing datasets. And both quantitative and qualitative results demonstrate the effectiveness of the proposed SimM in calibrating the layout inconsistencies. Our project page is at https://simm-t2i.github.io/SimM.

ODCR: Orthogonal Decoupling Contrastive Regularization for Unpaired Image Dehazing
Zhongze Wang, Haitao Zhao, Jingchao Peng, Lujian Yao, Kaijie Zhao; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 25479-25489
Unpaired image dehazing (UID) holds significant research importance due to the challenges in acquiring haze/clear image pairs with identical backgrounds. This paper proposes a novel method for UID named Orthogonal Decoupling Contrastive Regularization (ODCR). Our method is grounded in the assumption that an image consists of both haze-related features which influence the degree of haze and haze-unrelated features such as texture and semantic information. ODCR aims to ensure that the haze-related features of the dehazing result closely resemble those of the clear image while the haze-unrelated features align with the input hazy image. To accomplish the motivation Orthogonal MLPs optimized geometrically on the Stiefel manifold are proposed which can project image features into an orthogonal space thereby reducing the relevance between different features. Furthermore a task-driven Depth-wise Feature Classifier (DWFC) is proposed which assigns weights to the orthogonal features based on the contribution of each channel's feature in predicting whether the feature source is hazy or clear in a self-supervised fashion. Finally a Weighted PatchNCE (WPNCE) loss is introduced to achieve the pulling of haze-related features in the output image toward those of clear images while bringing haze-unrelated features close to those of the hazy input. Extensive experiments demonstrate the superior performance of our ODCR method on UID.

Pose-Transformed Equivariant Network for 3D Point Trajectory Prediction
Ruixuan Yu, Jian Sun; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 5503-5512
Predicting 3D point trajectory is a fundamental learning task which commonly should be equivariant under Euclidean transformation e.g. SE(3). The existing equivariant models are commonly based on the group equivariant convolution equivariant message passing vector neuron frame averaging etc. In this paper we propose a novel pose-transformed equivariant network in which the points are firstly uniquely normalized and then transformed by the learned pose transformations upon which the points after motion are predicted and aggregated. Under each transformed pose we design the point position predictor consisting of multiple Pose-Transformed Points Prediction blocks in which the global and local motions are estimated and aggregated. This framework can be proven to be equivariant to SE(3) transformation over 3D points. We evaluate the pose-transformed equivariant network on extensive datasets including human motion capture molecular dynamics modeling and dynamics simulation. Extensive experimental comparisons demonstrated our SOTA performance compared with the existing equivariant networks for 3D point trajectory prediction.

OmniSeg3D: Omniversal 3D Segmentation via Hierarchical Contrastive Learning
Haiyang Ying, Yixuan Yin, Jinzhi Zhang, Fan Wang, Tao Yu, Ruqi Huang, Lu Fang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 20612-20622
Towards holistic understanding of 3D scenes a general 3D segmentation method is needed that can segment diverse objects without restrictions on object quantity or categories while also reflecting the inherent hierarchical structure. To achieve this we propose OmniSeg3D an omniversal segmentation method aims for segmenting anything in 3D all at once. The key insight is to lift multi-view inconsistent 2D segmentations into a consistent 3D feature field through a hierarchical contrastive learning framework which is accomplished by two steps. Firstly we design a novel hierarchical representation based on category-agnostic 2D segmentations to model the multi-level relationship among pixels. Secondly image features rendered from the 3D feature field are clustered at different levels which can be further drawn closer or pushed apart according to the hierarchical relationship between different levels. In tackling the challenges posed by inconsistent 2D s

egmentations this framework yields a global consistent 3D feature field which further enables hierarchical segmentation multi-object selection and global discretization. Extensive experiments demonstrate the effectiveness of our method on high-quality 3D segmentation and accurate hierarchical structure understanding. A graphical user interface further facilitates flexible interaction for omniversal 3D segmentation.

Revisiting Sampson Approximations for Geometric Estimation Problems
Felix Rydell, Angélica Torres, Viktor Larsson; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 4990-4998
Many problems in computer vision can be formulated as geometric estimation problems i.e. given a collection of measurements (e.g. point correspondences) we wish to fit a model (e.g. an essential matrix) that agrees with our observations. This necessitates some measure of how much an observation "agrees" with a given model. A natural choice is to consider the smallest perturbation that makes the observation exactly satisfy the constraints. However for many problems this metric is expensive or otherwise intractable to compute. The so-called Sampson error approximates this geometric error through a linearization scheme. For epipolar geometry the Sampson error is a popular choice and in practice known to yield very tight approximations of the corresponding geometric residual (the reprojection error). In this paper we revisit the Sampson approximation and provide new theoretical insights as to why and when this approximation works as well as provide explicit bounds on the tightness under some mild assumptions. Our theoretical results are validated in several experiments on real data and in the context of different geometric estimation tasks.

Fixed Point Diffusion Models
Xingjian Bai, Luke Melas-Kyriazi; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 9430-9440
We introduce the Fixed Point Diffusion Model (FPDM) a novel approach to image generation that integrates the concept of fixed point solving into the framework of diffusion-based generative modeling. Our approach embeds an implicit fixed point solving layer into the denoising network of a diffusion model transforming the diffusion process into a sequence of closely-related fixed point problems. Combined with a new stochastic training method this approach significantly reduces model size reduces memory usage and accelerates training. Moreover it enables the development of two new techniques to improve sampling efficiency: reallocating computation across timesteps and reusing fixed point solutions between timesteps. We conduct extensive experiments with state-of-the-art models on ImageNet FFHQ CelebA-HQ and LSUN-Church demonstrating substantial improvements in performance and efficiency. Compared to the state-of-the-art DiT model FPDM contains 87% fewer parameters consumes 60% less memory during training and improves image generation quality in situations where sampling computation or time is limited.
****
Simple Semantic-Aided Few-Shot Learning
Hai Zhang, Junzhe Xu, Shanlin Jiang, Zhenan He; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 28588-28597
Learning from a limited amount of data namely Few-Shot Learning stands out as a challenging computer vision task. Several works exploit semantics and design complicated semantic fusion mechanisms to compensate for rare representative features within restricted data. However relying on naive semantics such as class names introduces biases due to their brevity while acquiring extensive semantics from external knowledge takes a huge time and effort. This limitation severely constrains the potential of semantics in Few-Shot Learning. In this paper we design an automatic way called Semantic Evolution to generate high-quality semantics. The incorporation of high-quality semantics alleviates the need for complex network structures and learning algorithms used in previous works. Hence we employ a simple two-layer network termed Semantic Alignment Network to transform semantics and visual features into robust class prototypes with rich discriminative features for few-shot classification. The experimental results show our framework ou

tperforms all previous methods on six benchmarks demonstrating a simple network with high-quality semantics can beat intricate multi-modal modules on few-shot classification tasks. Code is available at https://github.com/zhangdoudou123/SemFew.

A Unified Framework for Microscopy Defocus Deblur with Multi-Pyramid Transformer and Contrastive Learning
Yuelin Zhang, Pengyu Zheng, Wanquan Yan, Chengyu Fang, Shing Shin Cheng; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 11125-11136
Defocus blur is a persistent problem in microscope imaging that poses harm to pathology interpretation and medical intervention in cell microscopy and microscope surgery. To address this problem a unified framework including the multi-pyramid transformer (MPT) and extended frequency contrastive regularization (EFCR) is proposed to tackle two outstanding challenges in microscopy deblur: longer attention span and data deficiency. The MPT employs an explicit pyramid structure at each network stage that integrates the cross-scale window attention (CSWA) the intra-scale channel attention (ISCA) and the feature-enhancing feed-forward network (FEFN) to capture long-range cross-scale spatial interaction and global channel context. The EFCR addresses the data deficiency problem by exploring latent deblur signals from different frequency bands. It also enables deblur knowledge transfer to learn cross-domain information from extra data improving deblur performance for labeled and unlabeled data. Extensive experiments and downstream task validation show the framework achieves state-of-the-art performance across multiple datasets. Project page: https://github.com/PieceZhang/MPT-CataBlur.

Frozen Feature Augmentation for Few-Shot Image Classification
Andreas Bär, Neil Houlsby, Mostafa Dehghani, Manoj Kumar; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 16046-16057
Training a linear classifier or lightweight model on top of pretrained vision model outputs so-called 'frozen features' leads to impressive performance on a number of downstream few-shot tasks. Currently frozen features are not modified during training. On the other hand when networks are trained directly on images data augmentation is a standard recipe that improves performance with no substantial overhead. In this paper we conduct an extensive pilot study on few-shot image classification that explores applying data augmentations in the frozen feature space dubbed 'frozen feature augmentation (FroFA)' covering twenty augmentations in total. Our study demonstrates that adopting a deceptively simple pointwise FroFA such as brightness can improve few-shot performance consistently across three network architectures three large pretraining datasets and eight transfer datasets.

Residual Learning in Diffusion Models
Junyu Zhang, Daochang Liu, Eunbyung Park, Shichao Zhang, Chang Xu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 7289-7299
Diffusion models (DMs) have achieved remarkable generative performance particularly with the introduction of stochastic differential equations (SDEs). Nevertheless a gap emerges in the model sampling trajectory constructed by reverse-SDE due to the accumulation of score estimation and discretization errors. This gap results in a residual in the generated images adversely impacting the image quality. To remedy this we propose a novel residual learning framework built upon a correction function. The optimized function enables to improve image quality via rectifying the sampling trajectory effectively. Importantly our framework exhibits transferable residual correction ability i.e. a correction function optimized for one pre-trained DM can also enhance the sampling trajectory constructed by other different DMs on the same dataset. Experimental results on four widely-used datasets demonstrate the effectiveness and transferable capability of our framework.

Leveraging Cross-Modal Neighbor Representation for Improved CLIP Classification
Chao Yi, Lu Ren, De-Chuan Zhan, Han-Jia Ye; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 27402-27411
CLIP showcases exceptional cross-modal matching capabilities due to its training on image-text contrastive learning tasks. However without specific optimization for unimodal scenarios its performance in single-modality feature extraction might be suboptimal. Despite this some studies have directly used CLIP's image encoder for tasks like few-shot classification introducing a misalignment between its pre-training objectives and feature extraction methods. This inconsistency can diminish the quality of the image's feature representation adversely affecting CLIP's effectiveness in target tasks. In this paper we view text features as precise neighbors of image features in CLIP's space and present a novel CrOss-moDal nEighbor Representation (CODER) based on the distance structure between images and their neighbor texts. This feature extraction method aligns better with CLIP's pre-training objectives thereby fully leveraging CLIP's robust cross-modal capabilities. The key to construct a high-quality CODER lies in how to create a vast amount of high-quality and diverse texts to match with images. We introduce the Auto Text Generator (ATG) to automatically produce the required text in a data-free and training-free manner. We apply CODER to CLIP's zero-shot and few-shot image classification tasks. Experiment results across various datasets and models confirm CODER's effectiveness. Code is available at: https://github.com/YCaigogogo/CVPR24-CODER.

Beyond Textual Constraints: Learning Novel Diffusion Conditions with Fewer Examples
Yuyang Yu, Bangzhen Liu, Chenxi Zheng, Xuemiao Xu, Huaidong Zhang, Shengfeng He; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 7109-7118
In this paper we delve into a novel aspect of learning novel diffusion conditions with datasets an order of magnitude smaller. The rationale behind our approach is the elimination of textual constraints during the few-shot learning process. To that end we implement two optimization strategies. The first prompt-free conditional learning utilizes a prompt-free encoder derived from a pre-trained Stable Diffusion model. This strategy is designed to adapt new conditions to the diffusion process by minimizing the textual-visual correlation thereby ensuring a more precise alignment between the generated content and the specified conditions. The second strategy entails condition-specific negative rectification which addresses the inconsistencies typically brought about by Classifier-free guidance in few-shot training contexts. Our extensive experiments across a variety of condition modalities demonstrate the effectiveness and efficiency of our framework yielding results comparable to those obtained with datasets a thousand times larger. Our codes are available at https://github.com/Yuyan9Yu/BeyondTextConstraint.

Incorporating Geo-Diverse Knowledge into Prompting for Increased Geographical Robustness in Object Recognition
Kyle Buettner, Sina Malakouti, Xiang Lorraine Li, Adriana Kovashka; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 13515-13524
Existing object recognition models have been shown to lack robustness in diverse geographical scenarios due to domain shifts in design and context. Class representations need to be adapted to more accurately reflect an object concept under these shifts. In the absence of training data from target geographies we hypothesize that geographically diverse descriptive knowledge of categories can enhance robustness. For this purpose we explore the feasibility of probing a large language model for geography-based object knowledge and we examine the effects of integrating knowledge into zero-shot and learnable soft prompting with CLIP. Within this exploration we propose geography knowledge regularization to ensure that soft prompts trained on a source set of geographies generalize to an unseen targ

et set. Accuracy gains over prompting baselines on DollarStreet while training only on Europe data are up to +2.8/1.2/1.6 on target data from Africa/Asia/Americas and +4.6 overall on the hardest classes. Competitive performance is shown vs. few-shot target training and analysis is provided to direct future study of geographical robustness.

Revisiting Adversarial Training Under Long-Tailed Distributions
Xinli Yue, Ningping Mou, Qian Wang, Lingchen Zhao; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 24492-24501
Deep neural networks are vulnerable to adversarial attacks leading to erroneous outputs. Adversarial training has been recognized as one of the most effective methods to counter such attacks. However existing adversarial training techniques have predominantly been evaluated on balanced datasets whereas real-world data often exhibit a long-tailed distribution casting doubt on the efficacy of these methods in practical scenarios. In this paper we delve into the performance of adversarial training under long-tailed distributions. Through an analysis of the prior method "RoBal" (Wu et al. CVPR'21) we discover that utilizing Balanced Softmax Loss (BSL) alone can obtain comparable performance to the complete RoBal approach while significantly reducing the training overhead. Then we reveal that adversarial training under long-tailed distributions also suffers from robust overfitting similar to uniform distributions. We explore utilizing data augmentation to mitigate this issue and unexpectedly discover that unlike results obtained with balanced data data augmentation not only effectively alleviates robust overfitting but also significantly improves robustness. We further identify that the improvement is attributed to the increased diversity of training data. Extensive experiments further corroborate that data augmentation alone can significantly improve robustness. Finally building on these findings we demonstrate that compared to RoBal the combination of BSL and data augmentation leads to a +6.66% improvement in model robustness under AutoAttack on CIFAR-10-LT. Our code is available at: https://github.com/NISPLab/AT-BSL.

Exploiting Style Latent Flows for Generalizing Deepfake Video Detection
Jongwook Choi, Taehoon Kim, Yonghyun Jeong, Seungryul Baek, Jongwon Choi; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 1133-1143
This paper presents a new approach for the detection of fake videos based on the analysis of style latent vectors and their abnormal behavior in temporal changes in the generated videos. We discovered that the generated facial videos suffer from the temporal distinctiveness in the temporal changes of style latent vectors which are inevitable during the generation of temporally stable videos with various facial expressions and geometric transformations. Our framework utilizes the StyleGRU module trained by contrastive learning to represent the dynamic properties of style latent vectors. Additionally we introduce a style attention module that integrates StyleGRU-generated features with content-based features enabling the detection of visual and temporal artifacts. We demonstrate our approach across various benchmark scenarios in deepfake detection showing its superiority in cross-dataset and cross-manipulation scenarios. Through further analysis we also validate the importance of using temporal changes of style latent vectors to improve the generality of deepfake video detection.

PIN: Positional Insert Unlocks Object Localisation Abilities in VLMs
Michael Dorkenwald, Nimrod Barazani, Cees G. M. Snoek, Yuki M. Asano; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 13548-13558
Vision-Language Models (VLMs) such as Flamingo and GPT-4V have shown immense potential by integrating large language models with vision systems. Nevertheless these models face challenges in the fundamental computer vision task of object localisation due to their training on multimodal data containing mostly captions without explicit spatial grounding. While it is possible to construct custom super

vised training pipelines with bounding box annotations that integrate with VLMs these result in specialized and hard-to-scale models. In this paper we aim to explore the limits of caption-based VLMs and instead propose to tackle the challenge in a simpler manner by i) keeping the weights of a caption-based VLM frozen and ii) not using any supervised detection data. To this end we introduce an input-agnostic Positional Insert (PIN) a learnable spatial prompt containing a minimal set of parameters that are slid inside the frozen VLM unlocking object localisation capabilities. Our PIN module is trained with a simple next-token prediction task on synthetic data without requiring the introduction of new output heads. Our experiments demonstrate strong zero-shot localisation performances on a variety of images including Pascal VOC COCO LVIS and diverse images like paintings or cartoons.

UniGarmentManip: A Unified Framework for Category-Level Garment Manipulation via Dense Visual Correspondence
Ruihai Wu, Haoran Lu, Yiyan Wang, Yubo Wang, Hao Dong; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 16340-16350
Garment manipulation (e.g. unfolding folding and hanging clothes) is essential for future robots to accomplish home-assistant tasks while highly challenging due to the diversity of garment configurations geometries and deformations. Although able to manipulate similar shaped garments in a certain task previous works mostly have to design different policies for different tasks could not generalize to garments with diverse geometries and often rely heavily on human-annotated data. In this paper we leverage the property that garments in a certain category have similar structures and then learn the topological dense (point-level) visual correspondence among garments in the category level with different deformations in the self-supervised manner. The topological correspondence can be easily adapted to the functional correspondence to guide the manipulation policies for various downstream tasks within only one or few-shot demonstrations. Experiments over garments in 3 different categories on 3 representative tasks in diverse scenarios using one or two arms taking one or more steps inputting flat or messy garments demonstrate the effectiveness of our proposed method. Project page: https://warshallrho.github.io/unigarmentmanip.

Multi-Attribute Interactions Matter for 3D Visual Grounding
Can Xu, Yuehui Han, Rui Xu, Le Hui, Jin Xie, Jian Yang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 17253-17262
3D visual grounding aims to localize 3D objects described by free-form language sentences. Following the detection-then-matching paradigm existing methods mainly focus on embedding object attributes in unimodal feature extraction and multimodal feature fusion to enhance the discriminability of the proposal feature for accurate grounding. However most of them ignore the explicit interaction of multiple attributes causing a bias in unimodal representation and misalignment in multimodal fusion. In this paper we propose a multi-attribute aware Transformer for 3D visual grounding learning the multi-attribute interactions to refine the intra-modal and inter-modal grounding cues. Specifically we first develop an attribute causal analysis module to quantify the causal effect of different attributes for the final prediction which provides powerful supervision to correct the misleading attributes and adaptively capture other discriminative features. Then we design an exchanging-based multimodal fusion module which dynamically replaces tokens with low attribute attention between modalities before directly integrating low-dimensional global features. This ensures an attribute-level multimodal information fusion and helps align the language and vision details more efficiently for fine-grained multimodal features. Extensive experiments show that our method can achieve state-of-the-art performance on ScanRefer and Sr3D/Nr3D datasets.
****
Video-P2P: Video Editing with Cross-attention Control

Shaoteng Liu, Yuechen Zhang, Wenbo Li, Zhe Lin, Jiaya Jia; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 8599-8608
Video-P2P is the first framework for real-world video editing with cross-attention control. While attention control has proven effective for image editing with pre-trained image generation models there are currently no large-scale video generation models publicly available. Video-P2P addresses this limitation by adapting an image generation diffusion model to complete various video editing tasks. Specifically we propose to first tune a Text-to-Set (T2S) model to complete an approximate inversion and then optimize a shared unconditional embedding to achieve accurate video inversion with a small memory cost. We further prove that it is crucial for consistent video editing. For attention control we introduce a novel decoupled-guidance strategy which uses different guidance strategies for the source and target prompts. The optimized unconditional embedding for the source prompt improves reconstruction ability while an initialized unconditional embedding for the target prompt enhances editability. Incorporating the attention maps of these two branches enables detailed editing. These technical designs enable various text-driven editing applications including word swap prompt refinement and attention re-weighting. Video-P2P works well on real-world videos for generating new characters while optimally preserving their original poses and scenes. It significantly outperforms previous approaches.
****
Hunting Attributes: Context Prototype-Aware Learning for Weakly Supervised Semantic Segmentation
Feilong Tang, Zhongxing Xu, Zhaojun Qu, Wei Feng, Xingjian Jiang, Zongyuan Ge; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 3324-3334
Recent weakly supervised semantic segmentation (WSSS) methods strive to incorporate contextual knowledge to improve the completeness of class activation maps (CAM). In this work we argue that the knowledge bias between instances and contexts affects the capability of the prototype to sufficiently understand instance semantics. Inspired by prototype learning theory we propose leveraging prototype awareness to capture diverse and fine-grained feature attributes of instances. The hypothesis is that contextual prototypes might erroneously activate similar and frequently co-occurring object categories due to this knowledge bias. Therefore we propose to enhance the prototype representation ability by mitigating the bias to better capture spatial coverage in semantic object regions. With this goal we present a Context Prototype-Aware Learning (CPAL) strategy which leverages semantic context to enrich instance comprehension. The core of this method is to accurately capture intra-class variations in object features through context-aware prototypes facilitating the adaptation to the semantic attributes of various instances. We design feature distribution alignment to optimize prototype awareness aligning instance feature distributions with dense features. In addition a unified training framework is proposed to combine label-guided classification supervision and prototypes-guided self-supervision. Experimental results on PASCAL VOC 2012 and MS COCO 2014 show that CPAL significantly improves off-the-shelf methods and achieves state-of-the-art performance. The project is available at \href https://github.com/Barrett-python/CPAL https://github.com/Barrett-python/CPAL.

SCINeRF: Neural Radiance Fields from a Snapshot Compressive Image
Yunhao Li, Xiaodong Wang, Ping Wang, Xin Yuan, Peidong Liu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 10542-10552
In this paper we explore the potential of Snapshot Com- pressive Imaging (SCI) technique for recovering the under- lying 3D scene representation from a single temporal com- pressed image. SCI is a cost-effective method that enables the recording of high-dimensional data such as hyperspec- tral or temporal information into a single image using low- cost 2D imaging sensors. To achieve this a series of spe- cially designed 2D masks are usually employed which not only reduces sto

rage requirements but also offers potential privacy protection. Inspired by this to take one step further our approach builds upon the powerful 3D scene represe n- tation capabilities of neural radiance fields (NeRF). Specif- ically we formu late the physical imaging process of SCI as part of the training of NeRF allowin g us to exploit its impressive performance in capturing complex scene struc- tur es. To assess the effectiveness of our method we con- duct extensive evaluations using both synthetic data and real data captured by our SCI system. Extensive e xperi- mental results demonstrate that our proposed approach sur- passes the sta te-of-the-art methods in terms of image re- construction and novel view image sy nthesis. Moreover our method also exhibits the ability to restore high frame- ra te multi-view consistent images by leveraging SCI and the rendering capabilities of NeRF. The code is available at https://github.com/WU-CVGL/SCINeRF.

Improved Visual Grounding through Self-Consistent Explanations

Ruozhen He, Paola Cascante-Bonilla, Ziyan Yang, Alexander C. Berg, Vicente Ordon ez; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recogn ition (CVPR), 2024, pp. 13095-13105

Vision-and-language models trained to match images with text can be combined wit h visual explanation methods to point to the locations of specific objects in an image. Our work shows that the localization --"grounding'"-- abilities of these models can be further improved by finetuning for self-consistent visual explana tions. We propose a strategy for augmenting existing text-image datasets with pa raphrases using a large language model and SelfEQ a weakly-supervised strategy o n visual explanation maps for paraphrases that encourages self-consistency. Spec ifically for an input textual phrase we attempt to generate a paraphrase and fin etune the model so that the phrase and paraphrase map to the same region in the image. We posit that this both expands the vocabulary that the model is able to handle and improves the quality of the object locations highlighted by gradient-based visual explanation methods (e.g. GradCAM). We demonstrate that SelfEQ impr oves performance on Flickr30k ReferIt and RefCOCO+ over a strong baseline method and several prior works. Particularly comparing to other methods that do not us e any type of box annotations we obtain 84.07% on Flickr30k (an absolute improve ment of 4.69%) 67.40% on ReferIt (an absolute improvement of 7.68%) and 75.10% 5 5.49% on RefCOCO+ test sets A and B respectively (an absolute improvement of 3.7 4% on average).

Monkey: Image Resolution and Text Label Are Important Things for Large Multi-mod al Models

Zhang Li, Biao Yang, Qiang Liu, Zhiyin Ma, Shuo Zhang, Jingxu Yang, Yabo Sun, Yu liang Liu, Xiang Bai; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 26763-26773

Large Multimodal Models (LMMs) have shown promise in vision-language tasks but s truggle with high-resolution input and detailed scene understanding. Addressing

these challenges we introduce Monkey to enhance LMM capabilities. Firstly Monkey processes input images by dividing them into uniform patches each matching the size (e.g. 448x448) used in the original training of the well-trained vision encoder. Equipped with individual adapter for each patch Monkey can handle higher resolutions up to 1344x896 pixels enabling the detailed capture of complex visual information. Secondly it employs a multi-level description generation method enriching the context for scene-object associations. This two-part strategy ensures more effective learning from generated data: the higher resolution allows for a more detailed capture of visuals which in turn enhances the effectiveness of comprehensive descriptions. Extensive ablative results validate the effectiveness of our designs. Additionally experiments on 18 datasets further demonstrate that Monkey surpasses existing LMMs in many tasks like Image Captioning and various Visual Question Answering formats. Specially in qualitative tests focused on dense text question answering Monkey has exhibited encouraging results compared with GPT4V. Code is available at https://github.com/Yuliang-Liu/Monkey.

FlashAvatar: High-fidelity Head Avatar with Efficient Gaussian Embedding
Jun Xiang, Xuan Gao, Yudong Guo, Juyong Zhang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 1802-1812
We propose FlashAvatar a novel and lightweight 3D animatable avatar representation that could reconstruct a digital avatar from a short monocular video sequence in minutes and render high-fidelity photo-realistic images at 300FPS on a consumer-grade GPU. To achieve this we maintain a uniform 3D Gaussian field embedded in the surface of a parametric face model and learn extra spatial offset to model non-surface regions and subtle facial details. While full use of geometric priors can capture high-frequency facial details and preserve exaggerated expressions proper initialization can help reduce the number of Gaussians thus enabling super-fast rendering speed. Extensive experimental results demonstrate that FlashAvatar outperforms existing works regarding visual quality and personalized details and is almost an order of magnitude faster in rendering speed. Project page: https://ustc3dv.github.io/FlashAvatar/

DifFlow3D: Toward Robust Uncertainty-Aware Scene Flow Estimation with Iterative Diffusion-Based Refinement
Jiuming Liu, Guangming Wang, Weicai Ye, Chaokang Jiang, Jinru Han, Zhe Liu, Guofeng Zhang, Dalong Du, Hesheng Wang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 15109-15119
Scene flow estimation which aims to predict per-point 3D displacements of dynamic scenes is a fundamental task in the computer vision field. However previous works commonly suffer from unreliable correlation caused by locally constrained searching ranges and struggle with accumulated inaccuracy arising from the coarse-to-fine structure. To alleviate these problems we propose a novel uncertainty-aware scene flow estimation network (DifFlow3D) with the diffusion probabilistic model. Iterative diffusion-based refinement is designed to enhance the correlation robustness and resilience to challenging cases e.g. dynamics noisy inputs repetitive patterns etc. To restrain the generation diversity three key flow-related features are leveraged as conditions in our diffusion model. Furthermore we also develop an uncertainty estimation module within diffusion to evaluate the reliability of estimated scene flow. Our DifFlow3D achieves state-of-the-art performance with 24.0% and 29.1% EPE3D reduction respectively on FlyingThings3D and KITTI 2015 datasets. Notably our method achieves an unprecedented millimeter-level accuracy (0.0078m in EPE3D) on the KITTI dataset. Additionally our diffusion-based refinement paradigm can be readily integrated as a plug-and-play module into existing scene flow networks significantly increasing their estimation accuracy. Codes are released at https://github.com/IRMVLab/DifFlow3D.

Decompose-and-Compose: A Compositional Approach to Mitigating Spurious Correlation
Fahimeh Hosseini Noohdani, Parsa Hosseini, Aryan Yazdan Parast, Hamidreza Yaghoubi Araghi, Mahdieh Soleymani Baghshah; Proceedings of the IEEE/CVF Conference on

Computer Vision and Pattern Recognition (CVPR), 2024, pp. 27662-27671
While standard Empirical Risk Minimization (ERM) training is proven effective fo r image classification on in-distribution data it fails to perform well on out-o f-distribution samples. One of the main sources of distribution shift for image classification is the compositional nature of images. Specifically in addition t o the main object or component(s) determining the label some other image compone nts usually exist which may lead to the shift of input distribution between trai n and test environments. More importantly these components may have spurious cor relations with the label. To address this issue we propose Decompose-and-Compose (DaC) which improves robustness to correlation shift by a compositional approac h based on combining elements of images. Based on our observations models traine d with ERM usually highly attend to either the causal components or the componen ts having a high spurious correlation with the label (especially in datapoints o n which models have a high confidence). In fact according to the amount of spuri ous correlation and the easiness of classification based on the causal or non-ca usal components the model usually attends to one of these more (on samples with high confidence). Following this we first try to identify the causal components of images using class activation maps of models trained with ERM. Afterward we i ntervene on images by combining them and retraining the model on the augmented d ata including the counterfactual ones. This work proposes a group-balancing meth od by intervening on images without requiring group labels or information regard ing the spurious features during training. The method has an overall better wors t group accuracy compared to previous methods with the same amount of supervisio n on the group labels in correlation shift. Our code is available at https://git hub.com/fhn98/DaC.

FlashEval: Towards Fast and Accurate Evaluation of Text-to-image Diffusion Gener ative Models
Lin Zhao, Tianchen Zhao, Zinan Lin, Xuefei Ning, Guohao Dai, Huazhong Yang, Yu W ang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recog nition (CVPR), 2024, pp. 16122-16131
In recent years there has been significant progress in the development of text-t o-image generative models. Evaluating the quality of the generative models is on e essential step in the development process. Unfortunately the evaluation proces s could consume a significant amount of computational resources making the requi red periodic evaluation of model performance (e.g. monitoring training progress) impractical. Therefore we seek to improve the evaluation efficiency by selectin g the representative subset of the text-image dataset. We systematically investi gate the design choices including the selection criteria (textural features or i magebased metrics) and the selection granularity (prompt-level or set-level). We find that the insights from prior work on subset selection for training data do not generalize to this problem and we propose FlashEval an iterative search alg orithm tailored to evaluation data selection. We demonstrate the effectiveness o f FlashEval on ranking diffusion models with various configurations including ar chitectures quantization levels and sampler schedules on COCO and DiffusionDB da tasets. Our searched 50-item subset could achieve comparable evaluation quality to the randomly sampled 500-item subset for COCO annotations on unseen models ac hieving a 10x evaluation speedup. We release the condensed subset of these commo nly used datasets to help facilitate diffusion algorithm design and evaluation a nd open-source FlashEval as a tool for condensing future datasets accessible at https://github.com/thu-nics/FlashEval.

ZERO-IG: Zero-Shot Illumination-Guided Joint Denoising and Adaptive Enhancement for Low-Light Images
Yiqi Shi, Duo Liu, Liguo Zhang, Ye Tian, Xuezhi Xia, Xiaojing Fu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024 , pp. 3015-3024
This paper presents a novel zero-shot method for jointly denoising and enhancing real-word low-light images. The proposed method is independent of training data and noise distribution. Guided by illumination we integrate denoising and enhan

cing processes seamlessly enabling end-to-end training. Pairs of downsampled ima ges are extracted from a single original low-light image and processed to prelim inarily reduce noise. Based on the smoothness of illumination near-authentic ill umination can be estimated from the denoised low-light image. Specifically the i llumination is constrained by the denoised image's brightness uniformly amplifyi ng pixels to raise overall brightness to normal-light level. We simultaneously r estrict the illumination by scaling each pixel of the denoised image based on it s intensity controlling the enhancement amplitude for different pixels. Applying the illumination to the original low-light image yields an adaptively enhanced reflection. This prevents under-enhancement and localized overexposure. Notably we concatenate the reflection with the illumination preserving their computation al relationship to ultimately remove noise from the original low-light image in the form of reflection. This provides sufficient image information for the denoi sing procedure without changing the noise characteristics. Extensive experiments demonstrate that our method outperforms other state-of-the-art methods. The sou rce code is available at https://github.com/Doyle59217/ZeroIG.

View From Above: Orthogonal-View aware Cross-view Localization
Shan Wang, Chuong Nguyen, Jiawei Liu, Yanhao Zhang, Sundaram Muthu, Fahira Afzal Maken, Kaihao Zhang, Hongdong Li; Proceedings of the IEEE/CVF Conference on Com puter Vision and Pattern Recognition (CVPR), 2024, pp. 14843-14852
This paper presents a novel aerial-to-ground feature aggregation strategy tailor ed for the task of cross-view image-based geo-localization. Conventional vision-based methods heavily rely on matching ground-view image features with a pre-rec orded image database often through establishing planar homography correspondence s via a planar ground assumption. As such they tend to ignore features that are off-ground and not suited for handling visual occlusions leading to unreliable l ocalization in challenging scenarios. We propose a Top-to-Ground Aggregation mod ule that capitalizes aerial orthographic views to aggregate features down to the ground level leveraging reliable off-ground information to improve feature alig nment. Furthermore we introduce a Cycle Domain Adaptation loss that ensures feat ure extraction robustness across domain changes. Additionally an Equidistant Re-projection loss is introduced to equalize the impact of all keypoints on orienta tion error leading to a more extended distribution of keypoints which benefits o rientation estimation. On both KITTI and Ford Multi-AV datasets our method consi stently achieves the lowest mean longitudinal and lateral translations across di fferent settings and obtains the smallest orientation error when the initial pos e is less accurate a more challenging setting. Further it can complete an entire route through continual vehicle pose estimation with initial vehicle pose given only at the starting point.

FinePOSE: Fine-Grained Prompt-Driven 3D Human Pose Estimation via Diffusion Mode ls
Jinglin Xu, Yijie Guo, Yuxin Peng; Proceedings of the IEEE/CVF Conference on Com puter Vision and Pattern Recognition (CVPR), 2024, pp. 561-570
The 3D Human Pose Estimation (3D HPE) task uses 2D images or videos to predict h uman joint coordinates in 3D space. Despite recent advancements in deep learning -based methods they mostly ignore the capability of coupling accessible texts an d naturally feasible knowledge of humans missing out on valuable implicit superv ision to guide the 3D HPE task. Moreover previous efforts often study this task from the perspective of the whole human body neglecting fine-grained guidance hi dden in different body parts. To this end we present a new Fine-Grained Prompt-D riven Denoiser based on a diffusion model for 3D HPE named FinePOSE. It consists of three core blocks enhancing the reverse process of the diffusion model: (1) Fine-grained Part-aware Prompt learning (FPP) block constructs fine-grained part -aware prompts via coupling accessible texts and naturally feasible knowledge of body parts with learnable prompts to model implicit guidance. (2) Fine-grained Prompt-pose Communication (FPC) block establishes fine-grained communications be tween learned part-aware prompts and poses to improve the denoising quality. (3) Prompt-driven Timestamp Stylization (PTS) block integrates learned prompt embed

ding and temporal information related to the noise level to enable adaptive adju stment at each denoising step. Extensive experiments on public single-human pose estimation datasets show that FinePOSE outperforms state-of-the-art methods. We further extend FinePOSE to multi-human pose estimation. Achieving 34.3mm averag e MPJPE on the EgoHumans dataset demonstrates the potential of FinePOSE to deal with complex multi-human scenarios. Code is available at https://github.com/PKU-ICST-MIPL/FinePOSE_CVPR2024.

BEM: Balanced and Entropy-based Mix for Long-Tailed Semi-Supervised Learning
Hongwei Zheng, Linyuan Zhou, Han Li, Jinming Su, Xiaoming Wei, Xiaoming Xu; Proc eedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (C VPR), 2024, pp. 22893-22903
Data mixing methods play a crucial role in semi-supervised learning (SSL) but th eir application is unexplored in long-tailed semi-supervised learning (LTSSL). T he primary reason is that the in-batch mixing manner fails to address class imba lance. Furthermore existing LTSSL methods mainly focus on re-balancing data quan tity but ignore class-wise uncertainty which is also vital for class balance. Fo r instance some classes with sufficient samples might still exhibit high uncerta inty due to indistinguishable features. To this end this paper introduces the Ba lanced and Entropy-based Mix (BEM) a pioneering mixing approach to re-balance th e class distribution of both data quantity and uncertainty. Specifically we firs t propose a class balanced mix bank to store data of each class for mixing. This bank samples data based on the estimated quantity distribution thus re-balancin g data quantity. Then we present an entropy-based learning approach to re-balanc e class-wise uncertainty including entropy-based sampling strategy entropy-based selection module and entropy-based class balanced loss. Our BEM first leverages data mixing for improving LTSSL and it can also serve as a complement to the ex isting re-balancing methods. Experimental results show that BEM significantly en hances various LTSSL frameworks and achieves state-of-the-art performances acros s multiple benchmarks.

HUGS: Holistic Urban 3D Scene Understanding via Gaussian Splatting
Hongyu Zhou, Jiahao Shao, Lu Xu, Dongfeng Bai, Weichao Qiu, Bingbing Liu, Yue Wa ng, Andreas Geiger, Yiyi Liao; Proceedings of the IEEE/CVF Conference on Compute r Vision and Pattern Recognition (CVPR), 2024, pp. 21336-21345
Holistic understanding of urban scenes based on RGB images is a challenging yet important problem. It encompasses understanding both the geometry and appearance to enable novel view synthesis parsing semantic labels and tracking moving obje cts. Despite considerable progress existing approaches often focus on specific a spects of this task and require additional inputs such as LiDAR scans or manuall y annotated 3D bounding boxes. In this paper we introduce a novel pipeline that utilizes 3D Gaussian Splatting for holistic urban scene understanding. Our main idea involves the joint optimization of geometry appearance semantics and motion using a combination of static and dynamic 3D Gaussians where moving object pose s are regularized via physical constraints. Our approach offers the ability to r ender new viewpoints in real-time yielding 2D and 3D semantic information with h igh accuracy and reconstruct dynamic scenes even in scenarios where 3D bounding box detection are highly noisy. Experimental results on KITTI KITTI-360 and Virt ual KITTI 2 demonstrate the effectiveness of our approach. Our project page is a t https://xdimlab.github.io/hugs_website.

DreamPropeller: Supercharge Text-to-3D Generation with Parallel Sampling
Linqi Zhou, Andy Shih, Chenlin Meng, Stefano Ermon; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 4610-461 9
Recent methods such as Score Distillation Sampling (SDS) and Variational Score D istillation (VSD) using 2D diffusion models for text-to-3D generation have demon strated impressive generation quality. However the long generation time of such algorithms significantly degrades the user experience. To tackle this problem we propose DreamPropeller a drop-in acceleration algorithm that can be wrapped aro

und any existing text-to-3D generation pipeline based on score distillation. Our framework generalizes Picard iterations a classical algorithm for parallel sampling an ODE path and can account for non-ODE paths such as momentum-based gradient updates and changes in dimensions during the optimization process as in many cases of 3D generation. We show that our algorithm trades parallel compute for wallclock time and empirically achieves up to 4.7x speedup with a negligible drop in generation quality for all tested frameworks.
****
PeVL: Pose-Enhanced Vision-Language Model for Fine-Grained Human Action Recognition
Haosong Zhang, Mei Chee Leong, Liyuan Li, Weisi Lin; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 18857-18867
Recent progress in Vision-Language (VL) foundation models has revealed the great advantages of cross-modality learning. However due to a large gap between vision and text they might not be able to sufficiently utilize the benefits of cross-modality information. In the field of human action recognition the additional pose modality may bridge the gap between vision and text to improve the effectiveness of cross-modality learning. In this paper we propose a novel framework called the Pose-enhanced Vision-Language (PeVL) model to adapt the VL model with pose modality to learn effective knowledge of fine-grained human actions. Our PeVL model includes two novel components: an Unsymmetrical Cross-Modality Refinement (UCMR) block and a Semantic-Guided Multi-level Contrastive (SGMC) module. The UCMR block includes Pose-guided Visual Refinement (P2V-R) and Visual-enriched Pose Refinement (V2P-R) for effective cross-modality learning. The SGMC module includes Multi-level Contrastive Associations of vision-text and pose-text at both action and sub-action levels and a Semantic-Guided Loss enabling effective contrastive learning with text. Built upon a pre-trained VL foundation model our model integrates trainable adapters and can be trained end-to-end. Our novel PeVL design over VL foundation model yields remarkable performance gains on four fine- grained human action recognition datasets achieving a new SOTA with a significantly small number of FLOPs for low- cost re-training.

DeepCache: Accelerating Diffusion Models for Free
Xinyin Ma, Gongfan Fang, Xinchao Wang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 15762-15772
Diffusion models have recently gained unprecedented attention in the field of image synthesis due to their remarkable generative capabilities. Notwithstanding their prowess these models often incur substantial computational costs primarily attributed to the sequential denoising process and cumbersome model size. Traditional methods for compressing diffusion models typically involve extensive retraining presenting cost and feasibility challenges. In this paper we introduce DeepCache a novel training-free paradigm that accelerates diffusion models from the perspective of model architecture. DeepCache capitalizes on the inherent temporal redundancy observed in the sequential denoising steps of diffusion models which caches and retrieves features across adjacent denoising stages thereby curtailing redundant computations. Utilizing the property of the U-Net we reuse the high-level features while updating the low-level features in a very cheap way. This innovative strategy in turn enables a speedup factor of 2.3xfor Stable Diffusion v1.5 with only a 0.05 decline in CLIP Score and 4.1xfor LDM-4-G with a slight decrease of 0.22 in FID on ImageNet. Our experiments also demonstrate DeepCache's superiority over existing pruning and distillation methods that necessitate retraining and its compatibility with current sampling techniques. Furthermore we find that under the same throughput DeepCache effectively achieves comparable or even marginally improved results with DDIM or PLMS.

GeoAuxNet: Towards Universal 3D Representation Learning for Multi-sensor Point Clouds
Shengjun Zhang, Xin Fei, Yueqi Duan; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 20019-20028

Point clouds captured by different sensors such as RGB-D cameras and LiDAR possess non-negligible domain gaps. Most existing methods design different network architectures and train separately on point clouds from various sensors. Typically point-based methods achieve outstanding performances on even-distributed dense point clouds from RGB-D cameras while voxel-based methods are more efficient for large-range sparse LiDAR point clouds. In this paper we propose geometry-to-voxel auxiliary learning to enable voxel representations to access point-level geometric information which supports better generalisation of the voxel-based backbone with additional interpretations of multi-sensor point clouds. Specifically we construct hierarchical geometry pools generated by a voxel-guided dynamic point network which efficiently provide auxiliary fine-grained geometric information adapted to different stages of voxel features. We conduct experiments on joint multi-sensor datasets to demonstrate the effectiveness of GeoAuxNet. Enjoying elaborate geometric information our method outperforms other models collectively trained on multi-sensor datasets and achieve competitive results with the-state-of-art experts on each single dataset.
****
Unveiling the Power of Audio-Visual Early Fusion Transformers with Dense Interactions through Masked Modeling
Shentong Mo, Pedro Morgado; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 27186-27196
Humans possess a remarkable ability to integrate auditory and visual information enabling a deeper understanding of the surrounding environment. This early fusion of audio and visual cues demonstrated through cognitive psychology and neuroscience research offers promising potential for developing multimodal perception models. However training early fusion architectures poses significant challenges as the increased model expressivity requires robust learning frameworks to harness their enhanced capabilities. In this paper we address this challenge by leveraging the masked reconstruction framework previously successful in unimodal settings to train audio-visual encoders with early fusion. Additionally we propose an attention-based fusion module that captures interactions between local audio and visual representations enhancing the model's ability to capture fine-grained interactions. While effective this procedure can become computationally intractable as the number of local representations increases. Thus to address the computational complexity we propose an alternative procedure that factorizes the local representations before representing audio-visual interactions. Extensive evaluations on a variety of datasets demonstrate the superiority of our approach in audio-event classification visual sound localization sound separation and audio-visual segmentation. These contributions enable the efficient training of deeply integrated audio-visual models and significantly advance the usefulness of early fusion architectures.
****
Learning Correlation Structures for Vision Transformers
Manjin Kim, Paul Hongsuck Seo, Cordelia Schmid, Minsu Cho; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 18941-18951
We introduce a new attention mechanism dubbed structural self-attention (StructSA) that leverages rich correlation patterns naturally emerging in key-query interactions of attention. StructSA generates attention maps by recognizing space-time structures of key-query correlations via convolution and uses them to dynamically aggregate local contexts of value features. This effectively leverages rich structural patterns in images and videos such as scene layouts object motion and inter-object relations.Using StructSA as a main building block we develop the structural vision transformer (StructViT) and evaluate its effectiveness on both image and video classification tasks achieving state-of-the-art results on ImageNet-1K Kinetics-400 Something-Something V1 & V2 Diving-48 and FineGym.

Dysen-VDM: Empowering Dynamics-aware Text-to-Video Diffusion with LLMs
Hao Fei, Shengqiong Wu, Wei Ji, Hanwang Zhang, Tat-Seng Chua; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp

. 7641-7653
Text-to-video (T2V) synthesis has gained increasing attention in the community i
n which the recently emerged diffusion models (DMs) have promisingly shown stron
ger performance than the past approaches. While existing state-of-the-art DMs ar
e competent to achieve high-resolution video generation they may largely suffer
from key limitations (e.g. action occurrence disorders crude video motions) with
 respect to the intricate temporal dynamics modeling one of the crux of video sy
nthesis. In this work we investigate strengthening the awareness of video dynami
cs for DMs for high-quality T2V generation. Inspired by human intuition we desig
n an innovative dynamic scene manager (dubbed as Dysen) module which includes (s
tep-1) extracting from input text the key actions with proper time-order arrange
ment (step-2) transforming the action schedules into the dynamic scene graph (DS
G) representations and (step-3) enriching the scenes in the DSG with sufficient
and reasonable details. Taking advantage of the existing powerful LLMs (e.g. Cha
tGPT) via in-context learning Dysen realizes (nearly) human-level temporal dynam
ics understanding. Finally the resulting video DSG with rich action scene detail
s is encoded as fine-grained spatio-temporal features integrated into the backbo
ne T2V DM for video generating. Experiments on popular T2V datasets suggest that
 our Dysen-VDM consistently outperforms prior arts with significant margins espe
cially in scenarios with complex actions.

PrPSeg: Universal Proposition Learning for Panoramic Renal Pathology Segmentatio
n
Ruining Deng, Quan Liu, Can Cui, Tianyuan Yao, Jialin Yue, Juming Xiong, Lining
Yu, Yifei Wu, Mengmeng Yin, Yu Wang, Shilin Zhao, Yucheng Tang, Haichun Yang, Yu
ankai Huo; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern
 Recognition (CVPR), 2024, pp. 11736-11746
Understanding the anatomy of renal pathology is crucial for advancing disease di
agnostics treatment evaluation and clinical research. The complex kidney system
comprises various components across multiple levels including regions (cortex me
dulla) functional units (glomeruli tubules) and cells (podocytes mesangial cells
 in glomerulus). Prior studies have predominantly overlooked the intricate spati
al interrelations among objects from clinical knowledge. In this research we int
roduce a novel universal proposition learning approach called panoramic renal pa
thology segmentation (PrPSeg) designed to segment comprehensively panoramic stru
ctures within kidney by integrating extensive knowledge of kidney anatomy. In th
is paper we propose (1) the design of a comprehensive universal proposition matr
ix for renal pathology facilitating the incorporation of classification and spat
ial relationships into the segmentation process; (2) a token-based dynamic head
single network architecture with the improvement of the partial label image segm
entation and capability for future data enlargement; and (3) an anatomy loss fun
ction quantifying the inter-object relationships across the kidney.

RepKPU: Point Cloud Upsampling with Kernel Point Representation and Deformation
Yi Rong, Haoran Zhou, Kang Xia, Cheng Mei, Jiahao Wang, Tong Lu; Proceedings of
the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024,
 pp. 21050-21060
In this work we present RepKPU an efficient network for point cloud upsampling.
We propose to promote upsampling performance by exploiting better shape represen
tation and point generation strategy. Inspired by KPConv we propose a novel repr
esentation called RepKPoints to effectively characterize the local geometry whos
e advantages over prior representations are as follows: (1) density-sensitive; (
2) large receptive fields; (3) position-adaptive which makes RepKPoints a genera
lized form of previous representations. Moreover we propose a novel paradigm nam
ely Kernel-to-Displacement generation for point generation where point cloud ups
ampling is reformulated as the deformation of kernel points. Specifically we pro
pose KP-Queries which is a set of kernel points with predefined positions and le
arned features to serve as the initial state of upsampling. Using cross-attentio
n mechanisms we achieve interactions between RepKPoints and KP-Queries and subse
quently KP-Queries are converted to displacement features followed by a MLP to p

redict the new positions of KP-Queries which serve as the generated points. Exte
nsive experimental results demonstrate that RepKPU outperforms state-of-the-art
methods on several widely-used benchmark datasets with high efficiency.

ConCon-Chi: Concept-Context Chimera Benchmark for Personalized Vision-Language T
asks
Andrea Rosasco, Stefano Berti, Giulia Pasquale, Damiano Malafronte, Shogo Sato,
Hiroyuki Segawa, Tetsugo Inada, Lorenzo Natale; Proceedings of the IEEE/CVF Conf
erence on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 22239-22248
While recent Vision-Language (VL) models excel at open-vocabulary tasks it is un
clear how to use them with specific or uncommon concepts. Personalized Text-to-I
mage Retrieval (TIR) or Generation (TIG) are recently introduced tasks that repr
esent this challenge where the VL model has to learn a concept from few images a
nd respectively discriminate or generate images of the target concept in arbitra
ry contexts. We identify the ability to learn new meanings and their composition
ality with known ones as two key properties of a personalized system. We show th
at the available benchmarks offer a limited validation of personalized textual c
oncept learning from images with respect to the above properties and introduce C
onCon-Chi as a benchmark for both personalized TIR and TIG designed to fill this
 gap. We modelled the new-meaning concepts by crafting chimeric objects and form
ulating a large varied set of contexts where we photographed each object. To pro
mote the compositionality assessment of the learned concepts with known contexts
 we combined different contexts with the same concept and vice-versa. We carry o
ut a thorough evaluation of state-of-the-art methods on the resulting dataset. O
ur study suggests that future work on personalized TIR and TIG methods should fo
cus on the above key properties and we propose principles and a dataset for thei
r performance assessment. Dataset: https://doi.org/10.48557/QJ1166 and code: htt
ps://github.com/hsp-iit/concon-chi_benchmark.

Weakly-Supervised Audio-Visual Video Parsing with Prototype-based Pseudo-Labelin
g
Kranthi Kumar Rachavarapu, Kalyan Ramakrishnan, Rajagopalan A. N.; Proceedings o
f the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 202
4, pp. 18952-18962
In this paper we address the weakly-supervised Audio-Visual Video Parsing (AVVP)
 problem which aims at labeling events in a video as audible visible or both and
 temporally localizing and classifying them into known categories. This is chall
enging since we only have access to video-level (weak) event labels when trainin
g but need to predict event labels at the segment (frame) level at test time. Re
cent methods employ multiple-instance learning (MIL) techniques that tend to foc
us solely on the most discriminative segments resulting in frequent misclassific
ations. Our idea is to first construct several prototype features for each event
 class by clustering key segments identified for the event in the training data.
 We then assign pseudo labels to all training segments based on their feature si
milarities with these prototypes and re-train the model under weak and strong su
pervision. We facilitate this by structuring the feature space with contrastive
learning using pseudo labels. Experiments show that we outperform existing metho
ds for weakly-supervised AVVP. We also show that learning with weak and iterativ
ely re-estimated pseudo labels can be interpreted as an expectation-maximization
 (EM) algorithm providing further insight for our training procedure.

Intraoperative 2D/3D Image Registration via Differentiable X-ray Rendering
Vivek Gopalakrishnan, Neel Dey, Polina Golland; Proceedings of the IEEE/CVF Conf
erence on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 11662-11672
Surgical decisions are informed by aligning rapid portable 2D intraoperative ima
ges (e.g. X-rays) to a high-fidelity 3D preoperative reference scan (e.g. CT). H
owever 2D/3D registration can often fail in practice: conventional optimization
methods are prohibitively slow and susceptible to local minima while neural netw
orks trained on small datasets fail on new patients or require impractical landm
ark supervision. We present DiffPose a self-supervised approach that leverages p

atient-specific simulation and differentiable physics-based rendering to achieve accurate 2D/3D registration without relying on manually labeled data. Preoperatively a CNN is trained to regress the pose of a randomly oriented synthetic X-ray rendered from the preoperative CT. The CNN then initializes rapid intraoperative test-time optimization that uses the differentiable X-ray renderer to refine the solution. Our work further proposes several geometrically principled methods for sampling camera poses from SE(3) for sparse differentiable rendering and for driving registration in the tangent space se(3) with geodesic and multiscale locality-sensitive losses. DiffPose achieves sub-millimeter accuracy across surgical datasets at intraoperative speeds improving upon existing unsupervised methods by an order of magnitude and even outperforming supervised baselines. Our implementation is at https://github.com/eigenvivek/DiffPose.

MICap: A Unified Model for Identity-Aware Movie Descriptions
Haran Raajesh, Naveen Reddy Desanur, Zeeshan Khan, Makarand Tapaswi; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 14011-14021
Characters are an important aspect of any storyline and identifying and including them in descriptions is necessary for story understanding. While previous work has largely ignored identity and generated captions with someone (anonymized names) recent work formulates id-aware captioning as a fill-in-the-blanks (FITB) task where given a caption with blanks the goal is to predict person id labels. However to predict captions with ids a two-stage approach is required: first predict captions with someone then fill in identities. In this work we present a new single stage approach that can seamlessly switch between id-aware caption generation or FITB when given a caption with blanks. Our model Movie-Identity Captioner (MICap) uses a shared auto-regressive decoder that benefits from training with FITB and full-caption generation objectives while the encoder can benefit from or disregard captions with blanks as input. Another challenge with id-aware captioning is the lack of a metric to capture subtle differences between person ids. To this end we introduce iSPICE a caption evaluation metric that focuses on identity tuples created through intermediate scene graphs. We evaluate MICap on Large-Scale Movie Description Challenge (LSMDC) where we show a 4.2% improvement in FITB accuracy and a 1-2% bump in classic captioning metrics.

MonoDiff: Monocular 3D Object Detection and Pose Estimation with Diffusion Models
Yasiru Ranasinghe, Deepti Hegde, Vishal M. Patel; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 10659-10670
3D object detection and pose estimation from a single-view image is challenging due to the high uncertainty caused by the absence of 3D perception. As a solution recent monocular 3D detection methods leverage additional modalities such as stereo image pairs and LiDAR point clouds to enhance image features at the expense of additional annotation costs. We propose using diffusion models to learn effective representations for monocular 3D detection without additional modalities or training data. We present MonoDiff a novel framework that employs the reverse diffusion process to estimate 3D bounding box and orientation. But considering the variability in bounding box sizes along different dimensions it is ineffective to sample noise from a standard Gaussian distribution. Hence we adopt a Gaussian mixture model to sample noise during the forward diffusion process and initialize the reverse diffusion process. Furthermore since the diffusion model generates the 3D parameters for a given object image we leverage 2D detection information to provide additional supervision by maintaining the correspondence between 3D/2D projection. Finally depending on the signal-to-noise ratio we incorporate a dynamic weighting scheme to account for the level of uncertainty in the supervision by projection at different timesteps. MonoDiff outperforms current state-of-the-art monocular 3D detection methods on the KITTI and Waymo benchmarks without additional depth priors. MonoDiff project is available at: https://dylran.github.io/monodiff.github.io.

General Object Foundation Model for Images and Videos at Scale
Junfeng Wu, Yi Jiang, Qihao Liu, Zehuan Yuan, Xiang Bai, Song Bai; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 3783-3795
We present GLEE in this work an object-level foundation model for locating and identifying objects in images and videos. Through a unified framework GLEEaccomplishes detection segmentation tracking grounding and identification of arbitrary objects in the open world scenario for various object perception tasks. Adopting a cohesive learning strategy GLEE acquires knowledge from diverse data sources with varying supervision levels to formulate general object representations excelling in zero-shot transfer to new data and tasks. Specifically we employ an image encoder text encoder and visual prompter to handle multi-modal inputs enabling to simultaneously solve various object-centric downstream tasks while maintaining state-of-the-art performance. Demonstrated through extensive training on over five million images from diverse benchmarks GLEE exhibits remarkable versatility and improved generalization performance efficiently tackling downstream tasks without the need for task-specific adaptation. By integrating large volumes of automatically labeled data we further enhance its zero-shot generalization capabilities. Additionally GLEE is capable of being integrated into Large Language Models serving as a foundational model to provide universal object-level information for multi-modal tasks. We hope that the versatility and universality of our method will mark a significant step in the development of efficient visual foundation models for AGI systems. The models and code are released at https://github.com/FoundationVision/GLEE.

An Upload-Efficient Scheme for Transferring Knowledge From a Server-Side Pre-trained Generator to Clients in Heterogeneous Federated Learning
Jianqing Zhang, Yang Liu, Yang Hua, Jian Cao; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 12109-12119
Heterogeneous Federated Learning (HtFL) enables collaborative learning on multiple clients with different model architectures while preserving privacy. Despite recent research progress knowledge sharing in HtFL is still difficult due to data and model heterogeneity. To tackle this issue we leverage the knowledge stored in pre-trained generators and propose a new upload-efficient knowledge transfer scheme called Federated Knowledge-Transfer Loop (FedKTL). Our FedKTL can produce client-task-related prototypical image-vector pairs via the generator's inference on the server. With these pairs each client can transfer pre-existing knowledge from the generator to its local model through an additional supervised local task. We conduct extensive experiments on four datasets under two types of data heterogeneity with 14 kinds of models including CNNs and ViTs. Results show that our upload-efficient FedKTL surpasses seven state-of-the-art methods by up to 7.31% in accuracy. Moreover our knowledge transfer scheme is applicable in scenarios with only one edge client. Code: https://github.com/TsingZ0/FedKTL

MeshGPT: Generating Triangle Meshes with Decoder-Only Transformers
Yawar Siddiqui, Antonio Alliegro, Alexey Artemov, Tatiana Tommasi, Daniele Sirigatti, Vladislav Rosov, Angela Dai, Matthias Nießner; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 19615-19625
We introduce MeshGPT a new approach for generating triangle meshes that reflects the compactness typical of artist-created meshes in contrast to dense triangle meshes extracted by iso-surfacing methods from neural fields. Inspired by recent advances in powerful large language models we adopt a sequence-based approach to autoregressively generate triangle meshes as sequences of triangles. We first learn a vocabulary of latent quantized embeddings using graph convolutions which inform these embeddings of the local mesh geometry and topology. These embeddings are sequenced and decoded into triangles by a decoder ensuring that they can effectively reconstruct the mesh. A transformer is then trained on this learned vocabulary to predict the index of the next embedding given previous embeddings.

Once trained our model can be autoregressively sampled to generate new triangle meshes directly generating compact meshes with sharp edges more closely imitating the efficient triangulation patterns of human-crafted meshes. MeshGPT demonstrates a notable improvement over state of the art mesh generation methods with a 9% increase in shape coverage and a 30-point enhancement in FID scores across various categories.

Inlier Confidence Calibration for Point Cloud Registration
Yongzhe Yuan, Yue Wu, Xiaolong Fan, Maoguo Gong, Qiguang Miao, Wenping Ma; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 5312-5321
Inliers estimation constitutes a pivotal step in partially overlapping point cloud registration. Existing methods broadly obey coordinate-based scheme where inlier confidence is scored through simply capturing coordinate differences in the context. However this scheme results in massive inlier misinterpretation readily consequently affecting the registration performance. In this paper we explore to extend a new definition called inlier confidence calibration (ICC) to alleviate the above issues. Firstly we provide finely initial correspondences for ICC in order to generate high quality reference point cloud copy corresponding to the source point cloud. In particular we develop a soft assignment matrix optimization theorem that offers faster speed and greater precision compared to Sinkhorn. Benefiting from the high quality reference copy we argue the neighborhood patch formed by inlier and its neighborhood should have consistency between source point cloud and its reference copy. Based on this insight we construct transformation-invariant geometric constraints and capture geometric structure consistency to calibrate inlier confidence for estimated correspondences between source point cloud and its reference copy. Finally transformation is further calculated by the weighted SVD algorithm with the calibrated inlier confidence. Our model is trained in an unsupervised manner and extensive experiments on synthetic and real-world datasets illustrate the effectiveness of the proposed method.

Instance-aware Exploration-Verification-Exploitation for Instance ImageGoal Navigation
Xiaohan Lei, Min Wang, Wengang Zhou, Li Li, Houqiang Li; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 16329-16339
As a new embodied vision task Instance ImageGoal Navigation (IIN) aims to navigate to a specified object depicted by a goal image in an unexplored environment. The main challenge of this task lies in identifying the target object from different viewpoints while rejecting similar distractors. Existing ImageGoal Navigation methods usually adopt the simple Exploration-Exploitation framework and ignore the identification of specific instance during navigation. In this work we propose to imitate the human behaviour of "getting closer to confirm" when distinguishing objects from a distance. Specifically we design a new modular navigation framework named Instance-aware Exploration-Verification-Exploitation (IEVE) for instancelevel image goal navigation. Our method allows for active switching among the exploration verification and exploitation actions thereby facilitating the agent in making reasonable decisions under different situations. On the challenging HabitatMatterport 3D semantic (HM3DSEM) dataset our method surpasses previous state-of-theart work with a classical segmentation model (0.684 vs. 0.561 success) or a robust model (0.702 vs. 0.561 success). Our code will be made publicly available at https://github.com/XiaohanLei/IEVE.

One-2-3-45++: Fast Single Image to 3D Objects with Consistent Multi-View Generation and 3D Diffusion
Minghua Liu, Ruoxi Shi, Linghao Chen, Zhuoyang Zhang, Chao Xu, Xinyue Wei, Hansheng Chen, Chong Zeng, Jiayuan Gu, Hao Su; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 10072-10083
Recent advancements in open-world 3D object generation have been remarkable with image-to-3D methods offering superior fine-grained control over their text-to-3

D counterparts. However most existing models fall short in simultaneously provid ing rapid generation speeds and high fidelity to input images - two features ess ential for practical applications. In this paper we present One-2-3-45++ an inno vative method that transforms a single image into a detailed 3D textured mesh in approximately one minute. Our approach aims to fully harness the extensive know ledge embedded in 2D diffusion models and priors from valuable yet limited 3D da ta. This is achieved by initially finetuning a 2D diffusion model for consistent multi-view image generation followed by elevating these images to 3D with the a id of multi-view-conditioned 3D native diffusion models. Extensive experimental evaluations demonstrate that our method can produce high-quality diverse 3D asse ts that closely mirror the original input image.

Image Restoration by Denoising Diffusion Models with Iteratively Preconditioned Guidance
Tomer Garber, Tom Tirer; Proceedings of the IEEE/CVF Conference on Computer Visi on and Pattern Recognition (CVPR), 2024, pp. 25245-25254
Training deep neural networks has become a common approach for addressing image restoration problems. An alternative for training a "task-specific" network for each observation model is to use pretrained deep denoisers for imposing only the signal's prior within iterative algorithms without additional training. Recentl y a sampling-based variant of this approach has become popular with the rise of diffusion/score-based generative models. Using denoisers for general purpose res toration requires guiding the iterations to ensure agreement of the signal with the observations. In low-noise settings guidance that is based on back-projectio n (BP) has been shown to be a promising strategy (used recently also under the n ames "pseudoinverse" or "range/-space" guidance). However the presence of noise in the observations hinders the gains from this approach. In this paper we propo se a novel guidance technique based on preconditioning that allows traversing fr om BP-based guidance to least squares based guidance along the restoration schem e. The proposed approach is robust to noise while still having much simpler impl ementation than alternative methods (e.g. it does not require SVD or a large num ber of iterations). We use it within both an optimization scheme and a sampling-based scheme and demonstrate its advantages over existing methods for image debl urring and super-resolution.

Let's Think Outside the Box: Exploring Leap-of-Thought in Large Language Models with Creative Humor Generation
Shanshan Zhong, Zhongzhan Huang, Shanghua Gao, Wushao Wen, Liang Lin, Marinka Zi tnik, Pan Zhou; Proceedings of the IEEE/CVF Conference on Computer Vision and Pa ttern Recognition (CVPR), 2024, pp. 13246-13257
Chain-of-Thought (CoT) guides large language models (LLMs) to reason step-by-ste p and can motivate their logical reasoning ability. While effective for logical tasks CoT is not conducive to creative problem-solving which often requires out-of-box thoughts and is crucial for innovation advancements. In this paper we exp lore the Leap-of-Thought (LoT) abilities within LLMs -- a non-sequential creativ e paradigm involving strong associations and knowledge leaps. To this end we stu dy LLMs on the popular Oogiri game which needs participants to have good creativ ity and strong associative thinking for responding unexpectedly and humorously t o the given image text or both and thus is suitable for LoT study. Then to inves tigate LLMs' LoT ability in the Oogiri game we first build a multimodal and mult ilingual Oogiri-GO dataset which contains over 130000 samples from the Oogiri ga me and observe the insufficient LoT ability or failures of most existing LLMs on the Oogiri game. Accordingly we introduce a creative Leap-of-Thought (CLoT) par adigm to improve LLM's LoT ability. CLoT first formulates the Oogiri-GO dataset into LoT-oriented instruction tuning data to train pretrained LLM for achieving certain LoT humor generation and discrimination abilities. Then CLoT designs an explorative self-refinement that encourages the LLM to generate more creative Lo T data via exploring parallels between seemingly unrelated concepts and selects high-quality data to train itself for self-refinement. CLoT not only excels in h umor generation in the Oogiri game as shown in Fig. 1 but also boosts creative a

bilities in various tasks like "cloud guessing game" and "divergent association task". These findings advance our understanding and offer a pathway to improve LLMs' creative capacities for innovative applications across domains. The dataset code and models have been released online: https://zhongshsh.github.io/CLoT.

SceneFun3D: Fine-Grained Functionality and Affordance Understanding in 3D Scenes
Alexandros Delitzas, Ayca Takmaz, Federico Tombari, Robert Sumner, Marc Pollefeys, Francis Engelmann; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 14531-14542
Existing 3D scene understanding methods are heavily focused on 3D semantic and instance segmentation. However identifying objects and their parts only constitutes an intermediate step towards a more fine-grained goal which is effectively interacting with the functional interactive elements (e.g. handles knobs buttons) in the scene to accomplish diverse tasks. To this end we introduce SceneFun3D a large-scale dataset with more than 14.8k highly accurate interaction annotations for 710 high-resolution real-world 3D indoor scenes. We accompany the annotations with motion parameter information describing how to interact with these elements and a diverse set of natural language descriptions of tasks that involve manipulating them in the scene context. To showcase the value of our dataset we introduce three novel tasks namely functionality segmentation task-driven affordance grounding and 3D motion estimation and adapt existing state-of-the-art methods to tackle them. Our experiments show that solving these tasks in real 3D scenes remains challenging despite recent progress in closed-set and open-set 3D scene understanding methods.

Readout Guidance: Learning Control from Diffusion Features
Grace Luo, Trevor Darrell, Oliver Wang, Dan B Goldman, Aleksander Holynski; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 8217-8227
We present Readout Guidance a method for controlling text-to-image diffusion models with learned signals. Readout Guidance uses readout heads lightweight networks trained to extract signals from the features of a pre-trained frozen diffusion model at every timestep. These readouts can encode single-image properties such as pose depth and edges; or higher-order properties that relate multiple images such as correspondence and appearance similarity. Furthermore by comparing the readout estimates to a user-defined target and back-propagating the gradient through the readout head these estimates can be used to guide the sampling process. Compared to prior methods for conditional generation Readout Guidance requires significantly fewer added parameters and training samples and offers a convenient and simple recipe for reproducing different forms of conditional control under a single framework with a single architecture and sampling procedure. We showcase these benefits in the applications of drag-based manipulation identity-consistent generation and spatially aligned control.

A Unified Approach for Text- and Image-guided 4D Scene Generation
Yufeng Zheng, Xueting Li, Koki Nagano, Sifei Liu, Otmar Hilliges, Shalini De Mello; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 7300-7309
Large-scale diffusion generative models are greatly simplifying image video and 3D asset creation from user provided text prompts and images. However the challenging problem of text-to-4D dynamic 3D scene generation with diffusion guidance remains largely unexplored. We propose Dream-in-4D which features a novel two-stage approach for text-to-4D synthesis leveraging (1) 3D and 2D diffusion guidance to effectively learn a high-quality static 3D asset in the first stage; (2) a deformable neural radiance field that explicitly disentangles the learned static asset from its deformation preserving quality during motion learning; and (3) a multi-resolution feature grid for the deformation field with a displacement total variation loss to effectively learn motion with video diffusion guidance in the second stage. Through a user preference study we demonstrate that our approach significantly advances image and motion quality 3D consistency and text fideli

ty for text-to-4D generation compared to baseline approaches. Thanks to its moti
on-disentangled representation Dream-in-4D can also be easily adapted for contro
llable generation where appearance is defined by one or multiple images without
the need to modify the motion learning stage. Thus our method offers for the fir
st time a unified approach for text-to-4D image-to-4D and personalized 4D genera
tion tasks.

GaussianAvatar: Towards Realistic Human Avatar Modeling from a Single Video via
Animatable 3D Gaussians
Liangxiao Hu, Hongwen Zhang, Yuxiang Zhang, Boyao Zhou, Boning Liu, Shengping Zh
ang, Liqiang Nie; Proceedings of the IEEE/CVF Conference on Computer Vision and
Pattern Recognition (CVPR), 2024, pp. 634-644
We present GaussianAvatar an efficient approach to creating realistic human avat
ars with dynamic 3D appearances from a single video. We start by introducing ani
matable 3D Gaussians to explicitly represent humans in various poses and clothin
g styles. Such an explicit and animatable representation can fuse 3D appearances
 more efficiently and consistently from 2D observations. Our representation is f
urther augmented with dynamic properties to support pose-dependent appearance mo
deling where a dynamic appearance network along with an optimizable feature tens
or is designed to learn the motion-to-appearance mapping. Moreover by leveraging
 the differentiable motion condition our method enables a joint optimization of
motions and appearances during avatar modeling which helps to tackle the long-st
anding issue of inaccurate motion estimation in monocular settings. The efficacy
 of GaussianAvatar is validated on both the public dataset and our collected dat
aset demonstrating its superior performances in terms of appearance quality and
rendering efficiency.

MTMMC: A Large-Scale Real-World Multi-Modal Camera Tracking Benchmark
Sanghyun Woo, Kwanyong Park, Inkyu Shin, Myungchul Kim, In So Kweon; Proceedings
 of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2
024, pp. 22335-22346
Multi-target multi-camera tracking is a crucial task that involves identifying a
nd tracking individuals over time using video streams from multiple cameras. Thi
s task has practical applications in various fields such as visual surveillance
crowd behavior analysis and anomaly detection. However due to the difficulty and
 cost of collecting and labeling data existing datasets for this task are either
 synthetically generated or artificially constructed within a controlled camera
network setting which limits their ability to model real-world dynamics and gene
ralize to diverse camera configurations. To address this issue we present MTMMC
a real-world large-scale dataset that includes long video sequences captured by
16 multi-modal cameras in two different environments - campus and factory - acro
ss various time weather and season conditions. This dataset provides a challengi
ng test bed for studying multi-camera tracking under diverse real-world complexi
ties and includes an additional input modality of spatially aligned and temporal
ly synchronized RGB and thermal cameras which enhances the accuracy of multi-cam
era tracking. MTMMC is a super-set of existing datasets benefiting independent f
ields such as person detection re-identification and multiple object tracking. W
e provide baselines and new learning setups on this dataset and set the referenc
e scores for future studies. The datasets models and test server will be made pu
blicly available.

Enhanced Motion-Text Alignment for Image-to-Video Transfer Learning
Wei Zhang, Chaoqun Wan, Tongliang Liu, Xinmei Tian, Xu Shen, Jieping Ye; Proceed
ings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR
), 2024, pp. 18504-18515
Extending large image-text pre-trained models (e.g. CLIP) for video understandin
g has made significant advancements. To enable the capability of CLIP to perceiv
e dynamic information in videos existing works are dedicated to equipping the vi
sual encoder with various temporal modules. However these methods exhibit "asymm
etry" between the visual and textual sides with neither temporal descriptions in

input texts nor temporal modules in text encoder. This limitation hinders the potential of language supervision emphasized in CLIP and restricts the learning of temporal features as the text encoder has demonstrated limited proficiency in motion understanding. To address this issue we propose leveraging "MoTion-Enhanced Descriptions" (MoTED) to facilitate the extraction of distinctive temporal features in videos. Specifically we first generate discriminative motion-related descriptions via querying GPT-4 to compare easy-confusing action categories. Then we incorporate both the visual and textual encoders with additional perception modules to process the video frames and generated descriptions respectively. Finally we adopt a contrastive loss to align the visual and textual motion features. Extensive experiments on five benchmarks show that MoTED surpasses state-of-the-art methods with convincing gaps laying a solid foundation for empowering CLIP with strong temporal modeling.
****
DAP: A Dynamic Adversarial Patch for Evading Person Detectors
Amira Guesmi, Ruitian Ding, Muhammad Abdullah Hanif, Ihsen Alouani, Muhammad Shafique; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 24595-24604
Patch-based adversarial attacks were proven to compromise the robustness and reliability of computer vision systems. However their conspicuous and easily detectable nature challenge their practicality in real-world setting. To address this recent work has proposed using Generative Adversarial Networks (GANs) to generate naturalistic patches that may not attract human attention. However such approaches suffer from a limited latent space making it challenging to produce a patch that is efficient stealthy and robust to multiple real-world transformations. This paper introduces a novel approach that produces a Dynamic Adversarial Patch (DAP) designed to overcome these limitations. DAP maintains a naturalistic appearance while optimizing attack efficiency and robustness to real-world transformations. The approach involves redefining the optimization problem and introducing a novel objective function that incorporates a similarity metric to guide the patch's creation. Unlike GAN-based techniques the DAP directly modifies pixel values within the patch providing increased flexibility and adaptability to multiple transformations. Furthermore most clothing-based physical attacks assume static objects and ignore the possible transformations caused by non-rigid deformation due to changes in a person's pose. To address this limitation a `Creases Transformation' (CT) block is introduced enhancing the patch's resilience to a variety of real-world distortions. Experimental results demonstrate that the proposed approach outperforms state-of-the-art attacks achieving a success rate of up to 82.28% in the digital world when targeting the YOLOv7 detector and 65% in the physical world when targeting YOLOv3tiny detector deployed in edge-based smart cameras.

Learned Lossless Image Compression based on Bit Plane Slicing
Zhe Zhang, Huairui Wang, Zhenzhong Chen, Shan Liu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 27579-27588
Autoregressive Initial Bits (ArIB) a framework that combines subimage autoregression and latent variable models has shown its advantages in lossless image compression. However in current methods the image splitting makes the information of latent variables being uniformly distributed in each subimage and causes inadequate use of latent variables in addition to posterior collapse. To tackle these issues we introduce Bit Plane Slicing (BPS) splitting images in the bit plane dimension with the considerations on different importance for latent variables. Thus BPS provides a more effective representation by arranging subimages with decreasing importance for latent variables. To solve the problem of the increased number of dimensions caused by BPS we further propose a dimension-tailored autoregressive model that tailors autoregression methods for each dimension based on their characteristics efficiently capturing the dependencies in plane space and color dimensions. As shown in the extensive experimental results our method demonstrates the superior compression performance with comparable inference speed when

compared to the state-of-the-art normalizing-flow-based methods. The code is at https://github.com/ZZ022/ArIB-BPS.

UV-IDM: Identity-Conditioned Latent Diffusion Model for Face UV-Texture Generation
Hong Li, Yutang Feng, Song Xue, Xuhui Liu, Bohan Zeng, Shanglin Li, Boyu Liu, Jianzhuang Liu, Shumin Han, Baochang Zhang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 10585-10595
3D face reconstruction aims at generating high-fidelity 3D face shapes and textures from single-view or multi-view images. However current prevailing facial texture generation methods generally suffer from low-quality texture identity information loss and inadequate handling of occlusions. To solve these problems we introduce an Identity-Conditioned Latent Diffusion Model for face UV-texture generation (UV-IDM) to generate photo-realistic textures based on the Basel Face Model (BFM). UV-IDM leverages the powerful texture generation capacity of a latent diffusion model (LDM) to obtain detailed facial textures. To preserve the identity during the reconstruction procedure we design an identity-conditioned module that can utilize any in-the-wild image as a robust condition for the LDM to guide texture generation. UV-IDM can be easily adapted to different BFM-based methods as a high-fidelity texture generator. Furthermore in light of the limited accessibility of most existing UV-texture datasets we build a large-scale and publicly available UV-texture dataset based on BFM termed BFM-UV. Extensive experiments show that our UV-IDM can generate high-fidelity textures in 3D face reconstruction within seconds while maintaining image consistency bringing new state-of-the-art performance in facial texture generation.

Mosaic-SDF for 3D Generative Models
Lior Yariv, Omri Puny, Oran Gafni, Yaron Lipman; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 4630-4639
Current diffusion or flow-based generative models for 3D shapes divide to two: distilling pre-trained 2D image diffusion models and training directly on 3D shapes. When training a diffusion or flow models on 3D shapes a crucial design choice is the shape representation. An effective shape representation needs to adhere three design principles: it should allow an efficient conversion of large 3D datasets to the representation form; it should provide a good tradeoff of approximation power versus number of parameters; and it should have a simple tensorial form that is compatible with existing powerful neural architectures. While standard 3D shape representations such as volumetric grids and point clouds do not adhere to all these principles simultaneously we advocate in this paper a new representation that does. We introduce Mosaic-SDF (M-SDF): a simple 3D shape representation that approximates the Signed Distance Function (SDF) of a given shape by using a set of local grids spread near the shape's boundary. The M-SDF representation is fast to compute for each shape individually making it readily parallelizable; it is parameter efficient as it only covers the space around the shape's boundary; and it has a simple matrix form compatible with Transformer-based architectures. We demonstrate the efficacy of the M-SDF representation by using it to train a 3D generative flow model including class-conditioned generation with the ShapeNetCore-V2 (3D Warehouse) dataset and text-to-3D generation using a dataset of about 600k caption-shape pairs.

Diffusion Handles Enabling 3D Edits for Diffusion Models by Lifting Activations to 3D
Karran Pandey, Paul Guerrero, Matheus Gadelha, Yannick Hold-Geoffroy, Karan Singh, Niloy J. Mitra; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 7695-7704
Diffusion handles is a novel approach to enable 3D object edits on diffusion images requiring only existing pre-trained diffusion models depth estimation without any fine-tuning or 3D object retrieval. The edited results remain plausible photo-real and preserve object identity. Diffusion handles address a critically missing facet of generative image-based creative design. Our key insight is to lif

t diffusion activations for a selected object to 3D using a proxy depth 3D-trans form the depth and associated activations and project them back to image space. The diffusion process guided by the manipulated activations produces plausible e dited images showing complex 3D occlusion and lighting effects. We evaluate diff usion handles: quantitatively on a large synthetic data benchmark; and qualitati vely by a user study showing our output to be more plausible and better than pri or art at both 3D editing and identity control.

A Pedestrian is Worth One Prompt: Towards Language Guidance Person Re-Identifica tion
Zexian Yang, Dayan Wu, Chenming Wu, Zheng Lin, Jingzi Gu, Weiping Wang; Proceedi ngs of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR) , 2024, pp. 17343-17353
Extensive advancements have been made in person ReID through the mining of seman tic information. Nevertheless existing methods that utilize semantic-parts from a single image modality do not explicitly achieve this goal. Whiteness the impre ssive capabilities in multimodal understanding of Vision Language Foundation Mod el CLIP a recent two-stage CLIP-based method employs automated prompt engineerin g to obtain specific textual labels for classifying pedestrians. However we note that the predefined soft prompts may be inadequate in expressing the entire vis ual context and struggle to generalize to unseen classes. This paper presents an end-to-end Prompt-driven Semantic Guidance (PromptSG) framework that harnesses the rich semantics inherent in CLIP. Specifically we guide the model to attend t o regions that are semantically faithful to the prompt. To provide personalized language descriptions for specific individuals we propose learning pseudo tokens that represent specific visual contexts. This design not only facilitates learn ing fine-grained attribute information but also can inherently leverage language prompts during inference. Without requiring additional labeling efforts our Pro mptSG achieves state-of-the-art by over 10% on MSMT17 and nearly 5% on the Marke t-1501 benchmark.
****
Friendly Sharpness-Aware Minimization
Tao Li, Pan Zhou, Zhengbao He, Xinwen Cheng, Xiaolin Huang; Proceedings of the I EEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 5631-5640
Sharpness-Aware Minimization (SAM) has been instrumental in improving deep neura l network training by minimizing both training loss and loss sharpness. Despite the practical success the mechanisms behind SAM's generalization enhancements re main elusive limiting its progress in deep learning optimization. In this work w e investigate SAM's core components for generalization improvement and introduce "Friendly-SAM" (F-SAM) to further enhance SAM's generalization. Our investigati on reveals the key role of batch-specific stochastic gradient noise within the a dversarial perturbation i.e. the current minibatch gradient which significantly influences SAM's generalization performance. By decomposing the adversarial pert urbation in SAM into full gradient and stochastic gradient noise components we d iscover that relying solely on the full gradient component degrades generalizati on while excluding it leads to improved performance. The possible reason lies in the full gradient component's increase in sharpness loss for the entire dataset creating inconsistencies with the subsequent sharpness minimization step solely on the current minibatch data. Inspired by these insights F-SAM aims to mitigat e the negative effects of the full gradient component. It removes the full gradi ent estimated by an exponentially moving average (EMA) of historical stochastic gradients and then leverages stochastic gradient noise for improved generalizati on. Moreover we provide theoretical validation for the EMA approximation and pro ve the convergence of F-SAM on non-convex problems. Extensive experiments demons trate the superior generalization performance and robustness of F-SAM over vanil la SAM. Code is available at https://github.com/nblt/F-SAM.

BIVDiff: A Training-Free Framework for General-Purpose Video Synthesis via Bridg ing Image and Video Diffusion Models

Fengyuan Shi, Jiaxi Gu, Hang Xu, Songcen Xu, Wei Zhang, Limin Wang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 7393-7402
Diffusion models have made tremendous progress in text-driven image and video generation. Now text-to-image foundation models are widely applied to various downstream image synthesis tasks such as controllable image generation and image editing while downstream video synthesis tasks are less explored for several reasons. First it requires huge memory and computation overhead to train a video generation foundation model. Even with video foundation models additional costly training is still required for downstream video synthesis tasks. Second although some works extend image diffusion models into videos in a training-free manner temporal consistency cannot be well preserved. Finally these adaption methods are specifically designed for one task and fail to generalize to different tasks. To mitigate these issues we propose a training-free general-purpose video synthesis framework coined as BIVDiff via bridging specific image diffusion models and general text-to-video foundation diffusion models. Specifically we first use a specific image diffusion model (e.g. ControlNet and Instruct Pix2Pix) for frame-wise video generation then perform Mixed Inversion on the generated video and finally input the inverted latents into the video diffusion models (e.g. VidRD and ZeroScope) for temporal smoothing. This decoupled framework enables flexible image model selection for different purposes with strong task generalization and high efficiency. To validate the effectiveness and general use of BIVDiff we perform a wide range of video synthesis tasks including controllable video generation video editing video inpainting and outpainting.

NC-TTT: A Noise Constrastive Approach for Test-Time Training
David Osowiechi, Gustavo A. Vargas Hakim, Mehrdad Noori, Milad Cheraghalikhani, Ali Bahri, Moslem Yazdanpanah, Ismail Ben Ayed, Christian Desrosiers; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 6078-6086
Despite their exceptional performance in vision tasks deep learning models often struggle when faced with domain shifts during testing. Test-Time Training (TTT) methods have recently gained popularity by their ability to enhance the robustness of models through the addition of an auxiliary objective that is jointly optimized with the main task. Being strictly unsupervised this auxiliary objective is used at test time to adapt the model without any access to labels. In this work we propose Noise-Contrastive Test-Time Training (NC-TTT) a novel unsupervised TTT technique based on the discrimination of noisy feature maps. By learning to classify noisy views of projected feature maps and then adapting the model accordingly on new domains classification performance can be recovered by an important margin. Experiments on several popular test-time adaptation baselines demonstrate the advantages of our method compared to recent approaches for this task. The code can be found at: https://github.com/GustavoVargasHakim/NCTTT.git

NetTrack: Tracking Highly Dynamic Objects with a Net
Guangze Zheng, Shijie Lin, Haobo Zuo, Changhong Fu, Jia Pan; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 19145-19155
The complex dynamicity of open-world objects presents non-negligible challenges for multi-object tracking (MOT) often manifested as severe deformations fast motion and occlusions. Most methods that solely depend on coarse-grained object cues such as boxes and the overall appearance of the object are susceptible to degradation due to distorted internal relationships of dynamic objects. To address this problem this work proposes NetTrack an efficient generic and affordable tracking framework to introduce fine-grained learning that is robust to dynamicity. Specifically NetTrack constructs a dynamicity-aware association with a fine-grained Net leveraging point-level visual cues. Correspondingly a fine-grained sampler and matching method have been incorporated. Furthermore NetTrack learns object-text correspondence for fine-grained localization. To evaluate MOT in extremely dynamic open-world scenarios a bird flock tracking (BFT) dataset is constructe

d which exhibits high dynamicity with diverse species and open-world scenarios. Comprehensive evaluation on BFT validates the effectiveness of fine-grained learning on object dynamicity and thorough transfer experiments on challenging open-world benchmarks i.e. TAO TAO-OW AnimalTrack and GMOT-40 validate the strong generalization ability of NetTrack even without finetuning.

Grounded Question-Answering in Long Egocentric Videos
Shangzhe Di, Weidi Xie; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 12934-12943
Existing approaches to video understanding mainly designed for short videos from a third-person perspective are limited in their applicability in certain fields such as robotics. In this paper we delve into open-ended question-answering (QA) in long egocentric videos which allows individuals or robots to inquire about their own past visual experiences. This task presents unique challenges including the complexity of temporally grounding queries within extensive video content the high resource demands for precise data annotation and the inherent difficulty of evaluating open-ended answers due to their ambiguous nature. Our proposed approach tackles these challenges by (i) integrating query grounding and answering within a unified model to reduce error propagation; (ii) employing large language models for efficient and scalable data synthesis; and (iii) introducing a close-ended QA task for evaluation to manage answer ambiguity. Extensive experiments demonstrate the effectiveness of our method which also achieves state-of-the-art performance on the QAEgo4D and Ego4D-NLQ benchmarks. Code data and models are open-sourced at https://github.com/Becomebright/GroundVQA.

HPNet: Dynamic Trajectory Forecasting with Historical Prediction Attention
Xiaolong Tang, Meina Kan, Shiguang Shan, Zhilong Ji, Jinfeng Bai, Xilin Chen; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 15261-15270
Predicting the trajectories of road agents is essential for autonomous driving systems. The recent mainstream methods follow a static paradigm which predicts the future trajectory by using a fixed duration of historical frames. These methods make the predictions independently even at adjacent time steps which leads to potential instability and temporal inconsistency. As successive time steps have largely overlapping historical frames their forecasting should have intrinsic correlation such as overlapping predicted trajectories should be consistent or be different but share the same motion goal depending on the road situation. Motivated by this in this work we introduce HPNet a novel dynamic trajectory forecasting method. Aiming for stable and accurate trajectory forecasting our method leverages not only historical frames including maps and agent states but also historical predictions. Specifically we newly design a Historical Prediction Attention module to automatically encode the dynamic relationship between successive predictions. Besides it also extends the attention range beyond the currently visible window benefitting from the use of historical predictions. The proposed Historical Prediction Attention together with the Agent Attention and Mode Attention is further formulated as the Triple Factorized Attention module serving as the core design of HPNet. Experiments on the Argoverse and INTERACTION datasets show that HPNet achieves state-of-the-art performance and generates accurate and stable future trajectories. Our code are available at https://github.com/XiaolongTang23/HPNet.

Flexible Depth Completion for Sparse and Varying Point Densities
Jinhyung Park, Yu-Jhe Li, Kris Kitani; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 21540-21550
While recent depth completion methods have achieved remarkable results filling in relatively dense depth maps (e.g. projected 64-line LiDAR on KITTI or 500 sampled points on NYUv2) with RGB guidance their performance on very sparse input (e.g. 4-line LiDAR or 32 depth point measurements) is unverified. These sparser regimes present new challenges as a 4-line LiDAR increases the distance between pixels without depth and their nearest depth point sixfold from 5 pixels to 30 pix

els compared to 64 lines. Observing that existing methods struggle with sparse and variable distribution depth maps we propose an Affinity-Based Shift Correction (ASC) module that iteratively aligns depth predictions to input depth based on predicted affinities between image pixels and depth points. Our framework enables each depth point to adaptively influence and improve predictions across the image leading to largely improved results for fewer-line fewer-point and variable sparsity settings. Further we show improved performance in domain transfer from KITTI to nuScenes and from random sampling to irregular point distributions. Our correction module can easily be added to any depth completion or RGB-only depth estimation model notably allowing the latter to perform both completion and estimation with a single model.

Small Scale Data-Free Knowledge Distillation
He Liu, Yikai Wang, Huaping Liu, Fuchun Sun, Anbang Yao; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 6008-6016
Data-free knowledge distillation is able to utilize the knowledge learned by a large teacher network to augment the training of a smaller student network without accessing the original training data avoiding privacy security and proprietary risks in real applications. In this line of research existing methods typically follow an inversion-and-distillation paradigm in which a generative adversarial network on-the-fly trained with the guidance of the pre-trained teacher network is used to synthesize a large-scale sample set for knowledge distillation. In this paper we reexamine this common data-free knowledge distillation paradigm showing that there is considerable room to improve the overall training efficiency through a lens of "small-scale inverted data for knowledge distillation". In light of three empirical observations indicating the importance of how to balance class distributions in terms of synthetic sample diversity and difficulty during both data inversion and distillation processes we propose Small Scale Data-free Knowledge Distillation (SSD-KD). In formulation SSD-KD introduces a modulating function to balance synthetic samples and a priority sampling function to select proper samples facilitated by a dynamic replay buffer and a reinforcement learning strategy. As a result SSD-KD can perform distillation training conditioned on an extremely small scale of synthetic samples (e.g. 10x less than the original training data scale) making the overall training efficiency one or two orders of magnitude faster than many mainstream methods while retaining superior or competitive model performance as demonstrated on popular image classification and semantic segmentation benchmarks. The code is available at https://github.com/OSVAI/SSD-KD.
****
Shadows Don't Lie and Lines Can't Bend! Generative Models don't know Projective Geometry...for now
Ayush Sarkar, Hanlin Mai, Amitabh Mahapatra, Svetlana Lazebnik, D.A. Forsyth, Anand Bhattad; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 28140-28149
Generative models can produce impressively realistic images. This paper demonstrates that generated images have geometric features different from those of real images. We build a set of collections of generated images prequalified to fool simple signal-based classifiers into believing they are real. We then show that prequalified generated images can be identified reliably by classifiers that only look at geometric properties. We use three such classifiers. All three classifiers are denied access to image pixels and look only at derived geometric features. The first classifier looks at the perspective field of the image the second looks at lines detected in the image and the third looks at relations between detected objects and shadows. Our procedure detects generated images more reliably than SOTA local signal based detectors for images from a number of distinct generators. Saliency maps suggest that the classifiers can identify geometric problems reliably. We conclude that current generators cannot reliably reproduce geometric properties of real images.

CFPL-FAS: Class Free Prompt Learning for Generalizable Face Anti-spoofing
Ajian Liu, Shuai Xue, Jianwen Gan, Jun Wan, Yanyan Liang, Jiankang Deng, Sergio Escalera, Zhen Lei; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 222-232
Domain generalization (DG) based Face Anti-Spoofing (FAS) aims to improve the model's performance on unseen domains. Existing methods either rely on domain labels to align domain-invariant feature spaces or disentangle generalizable features from the whole sample which inevitably lead to the distortion of semantic feature structures and achieve limited generalization. In this work we make use of large-scale VLMs like CLIP and leverage the textual feature to dynamically adjust the classifier's weights for exploring generalizable visual features. Specifically we propose a novel Class Free Prompt Learning (CFPL) paradigm for DG FAS which utilizes two lightweight transformers namely Content Q-Former (CQF) and Style Q-Former (SQF) to learn the different semantic prompts conditioned on content and style features by using a set of learnable query vectors respectively. Thus the generalizable prompt can be learned by two improvements: (1) A Prompt-Text Matched (PTM) supervision is introduced to ensure CQF learns visual representation that is most informative of the content description. (2) A Diversified Style Prompt (DSP) technology is proposed to diversify the learning of style prompts by mixing feature statistics between instance-specific styles. Finally the learned text features modulate visual features to generalization through the designed Prompt Modulation (PM). Extensive experiments show that the CFPL is effective and outperforms the state-of-the-art methods on several cross-domain datasets.

SI-MIL: Taming Deep MIL for Self-Interpretability in Gigapixel Histopathology
Saarthak Kapse, Pushpak Pati, Srijan Das, Jingwei Zhang, Chao Chen, Maria Vakalopoulou, Joel Saltz, Dimitris Samaras, Rajarsi R. Gupta, Prateek Prasanna; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 11226-11237
Introducing interpretability and reasoning into Multiple Instance Learning (MIL) methods for Whole Slide Image (WSI) analysis is challenging given the complexity of gigapixel slides. Traditionally MIL interpretability is limited to identifying salient regions deemed pertinent for downstream tasks offering little insight to the end-user (pathologist) regarding the rationale behind these selections. To address this we propose Self-Interpretable MIL (SI-MIL) a method intrinsically designed for interpretability from the very outset. SI-MIL employs a deep MIL framework to guide an interpretable branch grounded on handcrafted pathological features facilitating linear predictions. Beyond identifying salient regions SI-MIL uniquely provides feature-level interpretations rooted in pathological insights for WSIs. Notably SI-MIL with its linear prediction constraints challenges the prevalent myth of an inevitable trade-off between model interpretability and performance demonstrating competitive results compared to state-of-the-art methods on WSI-level prediction tasks across three cancer types. In addition we thoroughly benchmark the local- and global-interpretability of SI-MIL in terms of statistical analysis a domain expert study and desiderata of interpretability namely user-friendliness and faithfulness.

GEARS: Local Geometry-aware Hand-object Interaction Synthesis
Keyang Zhou, Bharat Lal Bhatnagar, Jan Eric Lenssen, Gerard Pons-Moll; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 20634-20643
Generating realistic hand motion sequences in interaction with objects has gained increasing attention with the growing interest in digital humans. Prior work has illustrated the effectiveness of employing occupancy-based or distance-based virtual sensors to extract hand-object interaction features. Nonetheless these methods show limited generalizability across object categories shapes and sizes. We hypothesize that this is due to two reasons: 1) the limited expressiveness of employed virtual sensors and 2) scarcity of available training data. To tackle this challenge we introduce a novel joint-centered sensor designed to reason about local object geometry near potential interaction regions. The sensor queries

for object surface points in the neighbourhood of each hand joint. As an importa
nt step towards mitigating the learning complexity we transform the points from
global frame to hand template frame and use a shared module to process sensor fe
atures of each individual joint. This is followed by a spatio-temporal transform
er network aimed at capturing correlation among the joints in different dimensio
ns. Moreover we devise simple heuristic rules to augment the limited training se
quences with vast static hand grasping samples. This leads to a broader spectrum
 of grasping types observed during training in turn enhancing our model's genera
lization capability. We evaluate on two public datasets GRAB and InterCap where
our method shows superiority over baselines both quantitatively and perceptually
.

Open Vocabulary Semantic Scene Sketch Understanding
Ahmed Bourouis, Judith E. Fan, Yulia Gryaditskaya; Proceedings of the IEEE/CVF C
onference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 4176-4186
We study the underexplored but fundamental vision problem of machine understandi
ng of abstract freehand scene sketches. We introduce a sketch encoder that resul
ts in semantically-aware feature space which we evaluate by testing its performa
nce on a semantic sketch segmentation task. To train our model we rely only on t
he availability of bitmap sketches with their brief captions and do not require
any pixel-level annotations. To obtain generalization to a large set of sketches
 and categories we build on a vision transformer encoder pretrained with the CLI
P model. We freeze the text encoder and perform visual-prompt tuning of the visu
al encoder branch while introducing a set of critical modifications. Firstly we
augment the classical key-query (k-q) self-attention blocks with value-value (v-
v) self-attention blocks. Central to our model is a two-level hierarchical netwo
rk design that enables efficient semantic disentanglement: The first level ensur
es holistic scene sketch encoding and the second level focuses on individual cat
egories. We then in the second level of the hierarchy introduce a cross-attentio
n between textual and visual branches. Our method outperforms zero-shot CLIP pix
el accuracy of segmentation results by 37 points reaching an accuracy of 85.5% o
n the FS-COCO sketch dataset. Finally we conduct a user study that allows us to
identify further improvements needed over our method to reconcile machine and hu
man understanding of scene sketches.

IntrinsicAvatar: Physically Based Inverse Rendering of Dynamic Humans from Monoc
ular Videos via Explicit Ray Tracing
Shaofei Wang, Bozidar Antic, Andreas Geiger, Siyu Tang; Proceedings of the IEEE/
CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 1877
-1888
We present IntrinsicAvatar a novel approach to recovering the intrinsic properti
es of clothed human avatars including geometry albedo material and environment l
ighting from only monocular videos. Recent advancements in human-based neural re
ndering have enabled high-quality geometry and appearance reconstruction of clot
hed humans from just monocular videos. However these methods bake intrinsic prop
erties such as albedo material and environment lighting into a single entangled
neural representation. On the other hand only a handful of works tackle the prob
lem of estimating geometry and disentangled appearance properties of clothed hum
ans from monocular videos. They usually achieve limited quality and disentanglem
ent due to approximations of secondary shading effects via learned MLPs. In this
 work we propose to model secondary shading effects explicitly via Monte-Carlo r
ay tracing. We model the rendering process of clothed humans as a volumetric sca
ttering process and combine ray tracing with body articulation. Our approach can
 recover high-quality geometry albedo material and lighting properties of clothe
d humans from a single monocular video without requiring supervised pre-training
 using ground truth materials. Furthermore since we explicitly model the volumet
ric scattering process and ray tracing our model naturally generalizes to novel
poses enabling animation of the reconstructed avatar in novel lighting condition
s.

Efficient Detection of Long Consistent Cycles and its Application to Distributed Synchronization
Shaohan Li, Yunpeng Shi, Gilad Lerman; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 5260-5269
Group synchronization plays a crucial role in global pipelines for Structure from Motion (SfM). Its formulation is nonconvex and it is faced with highly corrupted measurements. Cycle consistency has been effective in addressing these challenges. However computationally efficient solutions are needed for cycles longer than three especially in practical scenarios where 3-cycles are unavailable. To overcome this computational bottleneck we propose an algorithm for group synchronization that leverages information from cycles of lengths ranging from three to six with a complexity of O(n^3) (or O(n^ 2.373) when using a faster matrix multiplication algorithm). We establish non-trivial theory for this and related methods that achieves competitive sample complexity assuming the uniform corruption model. To advocate the practical need for our method we consider distributed group synchronization which requires at least 4-cycles and we illustrate state-of-the-art performance by our method in this context.
****
LayoutFormer: Hierarchical Text Detection Towards Scene Text Understanding
Min Liang, Jia-Wei Ma, Xiaobin Zhu, Jingyan Qin, Xu-Cheng Yin; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 15665-15674
Existing scene text detectors generally focus on accurately detecting single-level (i.e. word-level line-level or paragraph-level) text entities without exploring the relationships among different levels of text entities. To comprehensively understand scene texts detecting multi-level texts while exploring their contextual information is critical. To this end we propose a unified framework (dubbed LayoutFormer) for hierarchical text detection which simultaneously conducts multi-level text detection and predicts the geometric layouts for promoting scene text understanding. In LayoutFormer WordDecoder LineDecoder and ParaDecoder are proposed to be responsible for word-level text prediction line-level text prediction and paragraph-level text prediction respectively. Meanwhile WordDecoder and ParaDecoder adaptively learn word-line and line-paragraph relationships respectively. In addition we propose a Prior Location Sampler to be used on multi-scale features to adaptively select a few representative foreground features for updating text queries. It can improve hierarchical detection performance while significantly reducing the computational cost. Comprehensive experiments verify that our method achieves state-of-the-art performance on single-level and hierarchical text detection.
****
Vlogger: Make Your Dream A Vlog
Shaobin Zhuang, Kunchang Li, Xinyuan Chen, Yaohui Wang, Ziwei Liu, Yu Qiao, Yali Wang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 8806-8817
In this work we present Vlogger a generic AI system for generating a minute-level video blog (i.e. vlog) of user descriptions. Different from short videos with a few seconds vlog often contains a complex storyline with diversified scenes which is challenging for most existing video generation approaches. To break through this bottleneck our Vlogger smartly leverages Large Language Model (LLM) as Director and decomposes a long video generation task of vlog into four key stages where we invoke various foundation models to play the critical roles of vlog professionals including (1) Script (2) Actor (3) ShowMaker and (4) Voicer. With such a design of mimicking human beings our Vlogger can generate vlogs through explainable cooperation of top-down planning and bottom-up shooting. More over we introduce a novel video diffusion model ShowMaker which serves as a videographer in our Vlogger for generating the video snippet of each shooting scene. By incorporating Script and Actor attentively as textual and visual prompts it can effectively enhance spatial-temporal coherence in the snippet. Besides we design a concise mixed training paradigm for ShowMaker boosting its capacity for both T2V generation and prediction. Finally the extensive experiments show that our method

achieves state-of-the-art performance on zero-shot T2V generation and prediction tasks. More importantly Vlogger can generate over 5-minute vlogs from open-world descriptions without loss of video coherence on script and actor.

CodedEvents: Optimal Point-Spread-Function Engineering for 3D-Tracking with Event Cameras
Sachin Shah, Matthew A. Chan, Haoming Cai, Jingxi Chen, Sakshum Kulshrestha, Chahat Deep Singh, Yiannis Aloimonos, Christopher A. Metzler; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 25265-25275
Point-spread-function (PSF) engineering is a well-established computational imaging technique that uses phase masks and other optical elements to embed extra information (e.g. depth) into the images captured by conventional CMOS image sensors. To date however PSF-engineering has not been applied to neuromorphic event cameras; a powerful new image sensing technology that responds to changes in the log-intensity of light. This paper establishes theoretical limits (Cramer Rao bounds) on 3D point localization and tracking with PSF-engineered event cameras. Using these bounds we first demonstrate that existing Fisher phase masks are already near-optimal for localizing static flashing point sources (e.g. blinking fluorescent molecules). We then demonstrate that existing designs are sub-optimal for tracking moving point sources and proceed to use our theory to design optimal phase masks and binary amplitude masks for this task. To overcome the non-convexity of the design problem we leverage novel implicit neural representation based parameterizations of the phase and amplitude masks. We demonstrate the efficacy of our designs through extensive simulations. We also validate our method with a simple prototype.
****
GLOW: Global Layout Aware Attacks on Object Detection
Jun Bao, Buyu Liu, Kui Ren, Jun Yu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 12057-12066
Adversarial attacks aim to perturb images such that a predictor outputs incorrect results. Due to the limited research in structured attacks imposing consistency checks on natural multi-object scenes is a practical defense against conventional adversarial attacks. More desired attacks should be able to fool defenses with such consistency checks. Therefore we present the first approach GLOW that copes with various attack requests by generating global layout-aware adversarial attacks in which both categorical and geometric layout constraints are explicitly established. Specifically we focus on object detection tasks and given a victim image GLOW first localizes victim objects according to target labels. And then it generates multiple attack plans together with their context-consistency scores. GLOW on the one hand is capable of handling various types of requests including single or multiple victim objects with or without specified victim objects. On the other hand it produces a consistency score for each attack plan reflecting the overall contextual consistency that both semantic category and global scene layout are considered. We conduct our experiments on MS COCO and Pascal. Extensive experimental results demonstrate that we can achieve about 30% average relative improvement compared to state-of-the-art methods in conventional single object attack request; Moreover such superiority is also valid across more generic attack requests under both white-box and zero-query black-box settings. Finally we conduct comprehensive human analysis which not only validates our claim further but also provides strong evidence that our evaluation metrics reflect human reviews well.
****
Learning Discriminative Dynamics with Label Corruption for Noisy Label Detection
Suyeon Kim, Dongha Lee, SeongKu Kang, Sukang Chae, Sanghwan Jang, Hwanjo Yu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 22477-22487
Label noise commonly found in real-world datasets has a detrimental impact on a model's generalization. To effectively detect incorrectly labeled instances previous works have mostly relied on distinguishable training signals such as traini

ng loss as indicators to differentiate between clean and noisy labels. However they have limitations in that the training signals incompletely reveal the model's behavior and are not effectively generalized to various noise types resulting in limited detection accuracy. In this paper we propose DynaCor framework that distinguishes incorrectly labeled instances from correctly labeled ones based on the dynamics of the training signals. To cope with the absence of supervision for clean and noisy labels DynaCor first introduces a label corruption strategy that augments the original dataset with intentionally corrupted labels enabling indirect simulation of the model's behavior on noisy labels. Then DynaCor learns to identify clean and noisy instances by inducing two clearly distinguishable clusters from the latent representations of training dynamics. Our comprehensive experiments show that DynaCor outperforms the state-of-the-art competitors and shows strong robustness to various noise types and noise rates.

Neural 3D Strokes: Creating Stylized 3D Scenes with Vectorized 3D Strokes
Hao-Bin Duan, Miao Wang, Yan-Xun Li, Yong-Liang Yang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 5240-5249
We present Neural 3D Strokes a novel technique to generate stylized images of a 3D scene at arbitrary novel views from multi-view 2D images. Different from existing methods which apply stylization to trained neural radiance fields at the voxel level our approach draws inspiration from image-to-painting methods simulating the progressive painting process of human artwork with vector strokes. We develop a palette of stylized 3D strokes from basic primitives and splines and consider the 3D scene stylization task as a multi-view reconstruction process based on these 3D stroke primitives. Instead of directly searching for the parameters of these 3D strokes which would be too costly we introduce a differentiable renderer that allows optimizing stroke parameters using gradient descent and propose a training scheme to alleviate the vanishing gradient issue. The extensive evaluation demonstrates that our approach effectively synthesizes 3D scenes with significant geometric and aesthetic stylization while maintaining a consistent appearance across different views. Our method can be further integrated with style loss and image-text contrastive models to extend its applications including color transfer and text-driven 3D scene drawing. Results and code are available at http://buaavrcg.github.io/Neural3DStrokes.

SIRA: Scalable Inter-frame Relation and Association for Radar Perception
Ryoma Yataka, Pu Wang, Petros Boufounos, Ryuhei Takahashi; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 15024-15034
Conventional radar feature extraction faces limitations due to low spatial resolution noise multipath reflection the presence of ghost targets and motion blur. Such limitations can be exacerbated by nonlinear object motion particularly from an ego-centric viewpoint. It becomes evident that to address these challenges the key lies in exploiting temporal feature relation over an extended horizon and enforcing spatial motion consistence for effective association. To this end this paper proposes SIRA (Scalable Inter-frame Relation and Association) with two designs. First inspired by Swin Transformer we introduce extended temporal relation generalizing the existing temporal relation layer from two consecutive frames to multiple inter-frames with temporally regrouped window attention for scalability. Second we propose motion consistency track with the concept of a pseudo-tracklet generated from observational data for better trajectory prediction and subsequent object association. Our approach achieves 58.11 mAP@0.5 for oriented object detection and 47.79 MOTA for multiple object tracking on the Radiate dataset surpassing previous state-of-the-art by a margin of +4.11 mAP@0.5 and +9.94 MOTA respectively.

VOODOO 3D: Volumetric Portrait Disentanglement For One-Shot 3D Head Reenactment
Phong Tran, Egor Zakharov, Long-Nhat Ho, Anh Tuan Tran, Liwen Hu, Hao Li; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVP

R), 2024, pp. 10336-10348
We present a 3D-aware one-shot head reenactment method based on a fully volumetric neural disentanglement framework for source appearance and driver expressions. Our method is real-time and produces high-fidelity and view-consistent output suitable for 3D teleconferencing systems based on holographic displays. Existing cutting-edge 3D-aware reenactment methods often use neural radiance fields or 3D meshes to produce view-consistent appearance encoding but at the same time they rely on linear face models such as 3DMM to achieve its disentanglement with facial expressions. As a result their reenactment results often exhibit identity leakage from the driver or have unnatural expressions. To address these problems we propose a neural self-supervised disentanglement approach that lifts both the source image and driver video frame into a shared 3D volumetric representation based on tri-planes. This representation can then be freely manipulated with expression tri-planes extracted from the driving images and rendered from an arbitrary view using neural radiance fields. We achieve this disentanglement via self-supervised learning on a large in-the-wild video dataset. We further introduce a highly effective fine-tuning approach to improve the generalizability of the 3D lifting using the same real-world data. We demonstrate state-of-the-art performance on a wide range of datasets and also showcase high-quality 3D-aware head reenactment on highly challenging and diverse subjects including non-frontal head poses and complex expressions for both source and driver.

Visual Fact Checker: Enabling High-Fidelity Detailed Caption Generation
Yunhao Ge, Xiaohui Zeng, Jacob Samuel Huffman, Tsung-Yi Lin, Ming-Yu Liu, Yin Cui; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 14033-14042
Existing automatic captioning methods for visual content face challenges such as lack of detail content hallucination and poor instruction following. In this work we propose VisualFactChecker (VFC) a flexible training-free pipeline that generates high-fidelity and detailed captions for both 2D images and 3D objects. VFC consists of three steps: 1) proposal where image-to-text captioning models propose multiple initial captions; 2) verification where a large language model (LLM) utilizes tools such as object detection and VQA models to fact-check proposed captions; 3) captioning where an LLM generates the final caption by summarizing caption proposals and the fact check verification results. In this step VFC can flexibly generate captions in various styles following complex instructions. We conduct comprehensive captioning evaluations using four metrics: 1) CLIP-Score for image-text similarity; 2) CLIP-Image-Score for measuring the image-image similarity between the original and the reconstructed image generated by a text-to-image model using the caption. 3) human study on Amazon Mechanical Turk; 4) GPT-4V for fine-grained evaluation. Evaluation results show that VFC outperforms state-of-the-art open-sourced captioning methods for 2D images on the COCO dataset and 3D assets on the Objaverse dataset. Our study demonstrates that by combining open-source models into a pipeline we can attain captioning capability comparable to proprietary models such as GPT-4V despite being over 10x smaller in model size.

Communication-Efficient Collaborative Perception via Information Filling with Codebook
Yue Hu, Juntong Peng, Sifei Liu, Junhao Ge, Si Liu, Siheng Chen; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 15481-15490
Collaborative perception empowers each agent to improve its perceptual ability through the exchange of perceptual messages with other agents. It inherently results in a fundamental trade-off between perception ability and communication cost. To address this bottleneck issue our core idea is to optimize the collaborative messages from two key aspects: representation and selection. The proposed codebook-based message representation enables the transmission of integer codes rather than high-dimensional feature maps. The proposed information-filling-driven message selection optimizes local messages to collectively fill each agent's info

rmation demand preventing information overflow among multiple agents. By integrating these two designs we propose CodeFilling a novel communication-efficient collaborative perception system which significantly advances the perception-communication trade-off and is inclusive to both homogeneous and heterogeneous collaboration settings. We evaluate CodeFilling in both a real-world dataset DAIR-V2X and a new simulation dataset OPV2VH+. Results show that CodeFilling outperforms previous SOTA Where2comm on DAIR-V2X/OPV2VH+ with 1333/1206x lower communication volume. Our code is available at https://github.com/PhyllisH/CodeFilling.

DiPrompT: Disentangled Prompt Tuning for Multiple Latent Domain Generalization in Federated Learning
Sikai Bai, Jie Zhang, Song Guo, Shuaicheng Li, Jingcai Guo, Jun Hou, Tao Han, Xiaocheng Lu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 27284-27293
Federated learning (FL) has emerged as a powerful paradigm for learning from decentralized data and federated domain generalization further considers the test dataset (target domain) is absent from the decentralized training data (source domains). However most existing FL methods assume that domain labels are provided during training and their evaluation imposes explicit constraints on the number of domains which must strictly match the number of clients. Because of the underutilization of numerous edge devices and additional cross-client domain annotations in the real world such restrictions may be impractical and involve potential privacy leaks. In this paper we propose an efficient and novel approach called Disentangled Prompt Tuning (DiPrompT) a method that tackles the above restrictions by learning adaptive prompts for domain generalization in a distributed manner. Specifically we first design two types of prompts i.e. global prompt to capture general knowledge across all clients and domain prompts to capture domain-specific knowledge. They eliminate the restriction on the one-to-one mapping between source domains and local clients. Furthermore a dynamic query metric is introduced to automatically search the suitable domain label for each sample which includes two-substep text-image alignments based on prompt tuning without labor-intensive annotation. Extensive experiments on multiple datasets demonstrate that our DiPrompT achieves superior domain generalization performance over state-of-the-art FL methods when domain labels are not provided and even outperforms many centralized learning methods using domain labels.

MVD-Fusion: Single-view 3D via Depth-consistent Multi-view Generation
Hanzhe Hu, Zhizhuo Zhou, Varun Jampani, Shubham Tulsiani; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 9698-9707
We present MVD-Fusion: a method for single-view 3D inference via generative modeling of multi-view-consistent RGB-D images. While recent methods pursuing 3D inference advocate learning novel-view generative models these generations are not 3D-consistent and require a distillation process to generate a 3D output. We instead cast the task of 3D inference as directly generating mutually-consistent multiple views and build on the insight that additionally inferring depth can provide a mechanism for enforcing this consistency. Specifically we train a denoising diffusion model to generate multi-view RGB-D images given a single RGB input image and leverage the (intermediate noisy) depth estimates to obtain reprojection-based conditioning to maintain multi-view consistency. We train our model using large-scale synthetic dataset Obajverse as well as the real-world CO3D dataset comprising of generic camera viewpoints. We demonstrate that our approach can yield more accurate synthesis compared to recent state-of-the-art including distillation-based 3D inference and prior multi-view generation methods. We also evaluate the geometry induced by our multi-view depth prediction and find that it yields a more accurate representation than other direct 3D inference approaches.

Effective Video Mirror Detection with Inconsistent Motion Cues
Alex Warren, Ke Xu, Jiaying Lin, Gary K.L. Tam, Rynson W.H. Lau; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024,

pp. 17244-17252
Image-based mirror detection has recently undergone rapid research due to its si gnificance in applications such as robotic navigation semantic segmentation and scene reconstruction. Recently VMD-Net was proposed as the first video mirror de tection technique by modeling dual correspondences between the inside and outsid e of the mirror both spatially and temporally. However this approach is not reli able as correspondences can occur completely inside or outside of the mirrors. I n addition the proposed dataset VMD-D contains many small mirrors limiting its a pplicability to real-world scenarios. To address these problems we developed a m ore challenging dataset that includes mirrors of various shapes and sizes at dif ferent locations of the frames providing a better reflection of real-world scena rios. Next we observed that the motions between the inside and outside of the mi rror are often inconsistent. For instance when moving in front of a mirror the m otion inside the mirror is often much smaller than the motion outside due to inc reased depth perception. With these observations we propose modeling inconsisten t motion cues to detect mirrors and a new network with two novel modules. The Mo tion Attention Module (MAM) explicitly models inconsistent motions around mirror s via optical flow and the Motion-Guided Edge Detection Module (MEDM) uses motio ns to guide mirror edge feature learning. Experimental results on our proposed d ataset show that our method outperforms state-of-the-arts. The code and dataset are available at https://github.com/AlexAnthonyWarren/MG-VMD.

Multi-Object Tracking in the Dark
Xinzhe Wang, Kang Ma, Qiankun Liu, Yunhao Zou, Ying Fu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 382-392
Low-light scenes are prevalent in real-world applications (e.g. autonomous drivi ng and surveillance at night). Recently multi-object tracking in various practic al use cases have received much attention but multi-object tracking in dark scen es is rarely considered. In this paper we focus on multi-object tracking in dark scenes. To address the lack of datasets we first build a Low-light Multi-Object Tracking (LMOT) dataset. LMOT provides well-aligned low-light video pairs captu red by our dual-camera system and high-quality multi-object tracking annotations for all videos. Then we propose a low-light multi-object tracking method termed as LTrack. We introduce the adaptive low-pass downsample module to enhance low-frequency components of images outside the sensor noises. The degradation suppre ssion learning strategy enables the model to learn invariant information under n oise disturbance and image quality degradation. These components improve the rob ustness of multi-object tracking in dark scenes. We conducted a comprehensive an alysis of our LMOT dataset and proposed LTrack. Experimental results demonstrate the superiority of the proposed method and its competitiveness in real night lo w-light scenes. Dataset and Code: https://github.com/ying-fu/LMOT

UniHuman: A Unified Model For Editing Human Images in the Wild
Nannan Li, Qing Liu, Krishna Kumar Singh, Yilin Wang, Jianming Zhang, Bryan A. Plummer, Zhe Lin; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 2039-2048
Human image editing includes tasks like changing a person's pose their clothing or editing the image according to a text prompt. However prior work often tackle s these tasks separately overlooking the benefit of mutual reinforcement from le arning them jointly. In this paper we propose UniHuman a unified model that addr esses multiple facets of human image editing in real-world settings. To enhance the model's generation quality and generalization capacity we leverage guidance from human visual encoders and introduce a lightweight pose-warping module that can exploit different pose representations accommodating unseen textures and pat terns. Furthermore to bridge the disparity between existing human editing benchm arks with real-world data we curated 400K high-quality human image-text pairs fo r training and collected 2K human images for out-of-domain testing both encompas sing diverse clothing styles backgrounds and age groups. Experiments on both in-domain and out-of-domain test sets demonstrate that UniHuman outperforms task-sp

ecific models by a significant margin. In user studies UniHuman is preferred by the users in an average of 77% of cases. Our project is available at https://github.com/NannanLi999/UniHuman.

DiffAgent: Fast and Accurate Text-to-Image API Selection with Large Language Model
Lirui Zhao, Yue Yang, Kaipeng Zhang, Wenqi Shao, Yuxin Zhang, Yu Qiao, Ping Luo, Rongrong Ji; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 6390-6399
Text-to-image (T2I) generative models have attracted significant attention and found extensive applications within and beyond academic research. For example the Civitai community a platform for T2I innovation currently hosts an impressive array of 74492 distinct models. However this diversity presents a formidable challenge in selecting the most appropriate model and parameters a process that typically requires numerous trials. Drawing inspiration from the tool usage research of large language models (LLMs) we introduce DiffAgent an LLM agent designed to screen the accurate selection in seconds via API calls. DiffAgent leverages a novel two-stage training framework SFTA enabling it to accurately align T2I API responses with user input in accordance with human preferences. To train and evaluate DiffAgent's capabilities we present DABench a comprehensive dataset encompassing an extensive range of T2I APIs from the community. Our evaluations reveal that DiffAgent not only excels in identifying the appropriate T2I API but also underscores the effectiveness of the SFTA training framework. Codes are available at https://github.com/OpenGVLab/DiffAgent.

In Search of a Data Transformation That Accelerates Neural Field Training
Junwon Seo, Sangyoon Lee, Kwang In Kim, Jaeho Lee; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 4830-4839
Neural field is an emerging paradigm in data representation that trains a neural network to approximate the given signal. A key obstacle that prevents its widespread adoption is the encoding speed---generating neural fields requires an overfitting of a neural network which can take a significant number of SGD steps to reach the desired fidelity level. In this paper we delve into the impacts of data transformations on the speed of neural field training specifically focusing on how permuting pixel locations affect the convergence speed of SGD. Counterintuitively we find that randomly permuting the pixel locations can considerably accelerate the training. To explain this phenomenon we examine the neural field training through the lens of PSNR curves loss landscapes and error patterns. Our analyses suggest that the random pixel permutations remove the easy-to-fit patterns which facilitate easy optimization in the early stage but hinder capturing fine details of the signal.

Zero-Painter: Training-Free Layout Control for Text-to-Image Synthesis
Marianna Ohanyan, Hayk Manukyan, Zhangyang Wang, Shant Navasardyan, Humphrey Shi; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 8764-8774
We present Zero-Painter a novel training-free framework for layout-conditional text-to-image synthesis that facilitates the creation of detailed and controlled imagery from textual prompts. Our method utilizes object masks and individual descriptions coupled with a global text prompt to generate images with high fidelity. Zero-Painter employs a two-stage process involving our novel Prompt-Adjusted Cross-Attention (PACA) and Region-Grouped Cross-Attention (ReGCA) blocks ensuring precise alignment of generated objects with textual prompts and mask shapes. Our extensive experiments demonstrate that Zero-Painter surpasses current state-of-the-art methods in preserving textual details and adhering to mask shapes. We will make the codes and the models publicly available.

DiffLoc: Diffusion Model for Outdoor LiDAR Localization
Wen Li, Yuyang Yang, Shangshu Yu, Guosheng Hu, Chenglu Wen, Ming Cheng, Cheng Wang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recogn

ition (CVPR), 2024, pp. 15045-15054
Absolute pose regression (APR) estimates global pose in an end-to-end manner achieving impressive results in learn-based LiDAR localization. However compared to the top-performing methods reliant on 3D-3D correspondence matching APR's accuracy still has room for improvement. We recognize APR's lack of robust features learning and iterative denoising process leads to suboptimal results. In this paper we propose DiffLoc a novel framework that formulates LiDAR localization as a conditional generation of poses. First we propose to utilize the foundation model and static-object-aware pool to learn robust features. Second we incorporate the iterative denoising process into APR via a diffusion model conditioned on the learned geometrically robust features. In addition due to the unique nature of diffusion models we propose to adapt our models to two additional applications: (1) using multiple inferences to evaluate pose uncertainty and (2) seamlessly introducing geometric constraints on denoising steps to improve prediction accuracy. Extensive experiments conducted on the Oxford Radar RobotCar and NCLT datasets demonstrate that DiffLoc outperforms better than the stateof-the-art methods. Especially on the NCLT dataset we achieve 35% and 34.7% improvement on position and orientation accuracy respectively. Our code is released at https://github.com/liw95/DiffLoc.

Towards 3D Vision with Low-Cost Single-Photon Cameras
Fangzhou Mu, Carter Sifferman, Sacha Jungerman, Yiquan Li, Mark Han, Michael Gleicher, Mohit Gupta, Yin Li; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 5302-5311
We present a method for reconstructing 3D shape of arbitrary Lambertian objects based on measurements by miniature energy-efficient low-cost single-photon cameras. These cameras operating as time resolved image sensors illuminate the scene with a very fast pulse of diffuse light and record the shape of that pulse as it returns back from the scene at a high temporal resolution. We propose to model this image formation process account for its non-idealities and adapt neural rendering to reconstruct 3D geometry from a set of spatially distributed sensors with known poses. We show that our approach can successfully recover complex 3D shapes from simulated data. We further demonstrate 3D object reconstruction from real-world captures utilizing measurements from a commodity proximity sensor. Our work draws a connection between image-based modeling and active range scanning and offers a step towards 3D vision with single-photon cameras.

On Scaling Up a Multilingual Vision and Language Model
Xi Chen, Josip Djolonga, Piotr Padlewski, Basil Mustafa, Soravit Changpinyo, Jialin Wu, Carlos Riquelme Ruiz, Sebastian Goodman, Xiao Wang, Yi Tay, Siamak Shakeri, Mostafa Dehghani, Daniel Salz, Mario Lucic, Michael Tschannen, Arsha Nagrani, Hexiang Hu, Mandar Joshi, Bo Pang, Ceslee Montgomery, Paulina Pietrzyk, Marvin Ritter, AJ Piergiovanni, Matthias Minderer, Filip Pavetic, Austin Waters, Gang Li, Ibrahim Alabdulmohsin, Lucas Beyer, Julien Amelot, Kenton Lee, Andreas Peter

Steiner, Yang Li, Daniel Keysers, Anurag Arnab, Yuanzhong Xu, Keran Rong, Alexander Kolesnikov, Mojtaba Seyedhosseini, Anelia Angelova, Xiaohua Zhai, Neil Houlsby, Radu Soricut; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 14432-14444

We explore the boundaries of scaling up a multilingual vision and language model both in terms of size of the components and the breadth of its training task mixture. Our model achieves new levels of performance on a wide-range of varied and complex tasks including multiple image-based captioning and question-answering tasks image-based document understanding and few-shot (in-context) learning as well as object detection video question answering and video captioning. Our model advances the state-of-the-art on most vision-and-language benchmarks considered (20+ of them). Finally we observe emerging capabilities such as complex counting and multilingual object detection tasks that are not explicitly in the training mix.

Day-Night Cross-domain Vehicle Re-identification

Hongchao Li, Jingong Chen, Aihua Zheng, Yong Wu, Yonglong Luo; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 12626-12635

Previous advances in vehicle re-identification (ReID) are mostly reported under favorable lighting conditions while cross-day-and-night performance is neglected which greatly hinders the development of related traffic intelligence applications. This work instead develops a novel Day-Night Dual-domain Modulation (DNDM) vehicle re-identification framework for day-night cross-domain traffic scenarios. Specifically a unique night-domain glare suppression module is provided to attenuate the headlight glare from raw nighttime vehicle images. To enhance vehicle features under low-light environments we propose a dual-domain structure enhancement module in the feature extractor which enhances geometric structures between appearance features. To alleviate day-night domain discrepancies we develop a cross-domain class awareness module that facilitates the interaction between appearance and structure features in both domains. In this work we address the Day-Night cross-domain ReID (DN-ReID) problem and provide a new cross-domain dataset named DN-Wild including day and night images of 2286 identities giving in total 85945 daytime images and 54952 nighttime images. Furthermore we also take into account the matter of balance between day and night samples and provide a dataset called DN-348. Exhaustive experiments demonstrate the robustness of the proposed framework in the DN-ReID problem. The code and benchmark are released at https://github.com/chenjingong/DN-ReID.

4D-fy: Text-to-4D Generation Using Hybrid Score Distillation Sampling

Sherwin Bahmani, Ivan Skorokhodov, Victor Rong, Gordon Wetzstein, Leonidas Guibas, Peter Wonka, Sergey Tulyakov, Jeong Joon Park, Andrea Tagliasacchi, David B. Lindell; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 7996-8006

Recent breakthroughs in text-to-4D generation rely on pre-trained text-to-image and text-to-video models to generate dynamic 3D scenes. However current text-to-4D methods face a three-way tradeoff between the quality of scene appearance 3D structure and motion. For example text-to-image models and their 3D-aware variants are trained on internet-scale image datasets and can be used to produce scenes with realistic appearance and 3D structure---but no motion. Text-to-video models are trained on relatively smaller video datasets and can produce scenes with motion but poorer appearance and 3D structure. While these models have complementary strengths they also have opposing weaknesses making it difficult to combine them in a way that alleviates this three-way tradeoff. Here we introduce hybrid score distillation sampling an alternating optimization procedure that blends supervision signals from multiple pre-trained diffusion models and incorporates benefits of each for high-fidelity text-to-4D generation. Using hybrid SDS we demonstrate synthesis of 4D scenes with compelling appearance 3D structure and motion.

Adversarial Distillation Based on Slack Matching and Attribution Region Alignmen
t
Shenglin Yin, Zhen Xiao, Mingxuan Song, Jieyi Long; Proceedings of the IEEE/CVF
Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 24605-24
614
Adversarial distillation (AD) is a highly effective method for enhancing the rob
ustness of small models. Contrary to expectations a high-performing teacher mode
l does not always result in a more robust student model. This is due to two main
 reasons. First when there are significant differences in predictions between th
e teacher model and the student model exact matching of predicted values using K
L divergence interferes with training leading to poor performance of existing me
thods. Second matching solely based on the output prevents the student model fro
m fully understanding the behavior of the teacher model. To address these challe
nges this paper proposes a novel AD method named SmaraAD. During the training pr
ocess we facilitate the student model in better understanding the teacher model'
s behavior by aligning the attribution region that the student model focuses on
with that of the teacher model. Concurrently we relax the condition of exact mat
ching in KL divergence and replace it with a more flexible matching criterion th
ereby enhancing the model's robustness. Extensive experiments substantiate the e
ffectiveness of our method in improving the robustness of small models outperfor
ming previous SOTA methods.

Boosting Spike Camera Image Reconstruction from a Perspective of Dealing with Sp
ike Fluctuations
Rui Zhao, Ruiqin Xiong, Jing Zhao, Jian Zhang, Xiaopeng Fan, Zhaofei Yu, Tiejun
Huang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Rec
ognition (CVPR), 2024, pp. 24955-24965
As a bio-inspired vision sensor with ultra-high speed spike cameras exhibit grea
t potential in recording dynamic scenes with high-speed motion or drastic light
changes. Different from traditional cameras each pixel in spike cameras records
the arrival of photons continuously by firing binary spikes at an ultra-fine tem
poral granularity. In this process multiple factors impact the imaging including
 the photons' Poisson arrival thermal noises from circuits and quantization effe
cts in spike readout. These factors introduce fluctuations to spikes making the
recorded spike intervals unstable and unable to reflect accurate light intensiti
es. In this paper we present an approach to deal with spike fluctuations and boo
st spike camera image reconstruction. We first analyze the quantization effects
and reveal the unbiased estimation attribute of the reciprocal of differential o
f spike firing time (DSFT). Based on this we propose a spike representation modu
le to use DSFT with multiple orders for fluctuation suppression where DSFT with
higher orders indicates spike integration duration between multiple spikes. We a
lso propose a module for inter-moment feature alignment at multiple granularitie
s. The coarser alignment is based on patch-level cross-attention with a local se
arch strategy and the finer alignment is based on deformable convolution at the
pixel level. Experimental results demonstrate the effectiveness of our method on
 both synthetic and real-captured data. The source code and dataset are availabl
e at https://github.com/ruizhao26/BSF.

Text-guided Explorable Image Super-resolution
Kanchana Vaishnavi Gandikota, Paramanand Chandramouli; Proceedings of the IEEE/C
VF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 25900
-25911
In this paper we introduce the problem of zero-shot text-guided exploration of t
he solutions to open-domain image super-resolution. Our goal is to allow users t
o explore diverse semantically accurate reconstructions that preserve data consi
stency with the low-resolution inputs for different large downsampling factors w
ithout explicitly training for these specific degradations. We propose two appro
aches for zero-shot text-guided super-resolution - i) modifying the generative p
rocess of text-to-image (T2I) diffusion models to promote consistency with low-r
esolution inputs and ii) incorporating language guidance into zero-shot diffusio

n-based restoration methods. We show that the proposed approaches result in diverse solutions that match the semantic meaning provided by the text prompt while preserving data consistency with the degraded inputs. We evaluate the proposed baselines for the task of extreme super-resolution and demonstrate advantages in terms of restoration quality diversity and explorability of solutions.

FreeControl: Training-Free Spatial Control of Any Text-to-Image Diffusion Model with Any Condition
Sicheng Mo, Fangzhou Mu, Kuan Heng Lin, Yanli Liu, Bochen Guan, Yin Li, Bolei Zhou; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 7465-7475
Recent approaches such as ControlNet offer users fine-grained spatial control over text-to-image (T2I) diffusion models. However auxiliary modules have to be trained for each spatial condition type model architecture and checkpoint putting them at odds with the diverse intents and preferences a human designer would like to convey to the AI models during the content creation process. In this work we present FreeControl a training-free approach for controllable T2I generation that supports multiple conditions architectures and checkpoints simultaneously. FreeControl enforces structure guidance to facilitate the global alignment with a guidance image and appearance guidance to collect visual details from images generated without control. Extensive qualitative and quantitative experiments demonstrate the superior performance of FreeControl across a variety of pre-trained T2I models. In particular FreeControl enables convenient training-free control over many different architectures and checkpoints allows the challenging input conditions on which most of the existing training-free methods fail and achieves competitive synthesis quality compared to training-based approaches. Project page :https://genforce.github.io/freecontrol/.

VMC: Video Motion Customization using Temporal Attention Adaption for Text-to-Video Diffusion Models
Hyeonho Jeong, Geon Yeong Park, Jong Chul Ye; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 9212-9221
Text-to-video diffusion models have advanced video generation significantly. However customizing these models to generate videos with tailored motions presents a substantial challenge. In specific they encounter hurdles in (1) accurately reproducing motion from a target video and (2) creating diverse visual variations. For example straightforward extensions of static image customization methods to video often lead to intricate entanglements of appearance and motion data. To tackle this here we present the Video Motion Customization (VMC) framework a novel one-shot tuning approach crafted to adapt temporal attention layers within video diffusion models. Our approach introduces a novel motion distillation objective using residual vectors between consecutive noisy latent frames as a motion reference. The diffusion process then preserve low-frequency motion trajectories while mitigating high-frequency motion-unrelated noise in image space. We validate our method against state-of-the-art video generative models across diverse real-world motions and contexts. Our codes and data can be found at: https://video-motion-customization.github.io/

Holodeck: Language Guided Generation of 3D Embodied AI Environments
Yue Yang, Fan-Yun Sun, Luca Weihs, Eli VanderBilt, Alvaro Herrasti, Winson Han, Jiajun Wu, Nick Haber, Ranjay Krishna, Lingjie Liu, Chris Callison-Burch, Mark Yatskar, Aniruddha Kembhavi, Christopher Clark; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 16227-16237
3D simulated environments play a critical role in Embodied AI but their creation requires expertise and extensive manual effort restricting their diversity and scope. To mitigate this limitation we present Holodeck a system that generates 3D environments to match a user-supplied prompt fully automatedly. Holodeck can generate diverse scenes e.g. arcades spas and museums adjust the designs for styles and can capture the semantics of complex queries such as "apartment for a researcher with a cat" and "office of a professor who is a fan of Star Wars". Holod

eck leverages a large language model (i.e. GPT-4) for common sense knowledge abo
ut what the scene might look like and uses a large collection of 3D assets from
Objaverse to populate the scene with diverse objects. To address the challenge o
f positioning objects correctly we prompt GPT-4 to generate spatial relational c
onstraints between objects and then optimize the layout to satisfy those constra
ints. Our large-scale human evaluation shows that annotators prefer Holodeck ove
r manually designed procedural baselines in residential scenes and that Holodeck
 can produce high-quality outputs for diverse scene types. We also demonstrate a
n exciting application of Holodeck in Embodied AI training agents to navigate in
 novel scenes like music rooms and daycares without human-constructed data which
 is a significant step forward in developing general-purpose embodied agents.
****
Distilled Datamodel with Reverse Gradient Matching
Jingwen Ye, Ruonan Yu, Songhua Liu, Xinchao Wang; Proceedings of the IEEE/CVF Co
nference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 11954-1196
3
The proliferation of large-scale AI models trained on extensive datasets has rev
olutionized machine learning. With these models taking on increasingly central r
oles in various applications the need to understand their behavior and enhance i
nterpretability has become paramount. To investigate the impact of changes in tr
aining data on a pre-trained model a common approach is leave-one-out retraining
. This entails systematically altering the training dataset by removing specific
 samples to observe resulting changes within the model. However retraining the m
odel for each altered dataset presents a significant computational challenge giv
en the need to perform this operation for every dataset variation. In this paper
 we introduce an efficient framework for assessing data impact comprising offlin
e training and online evaluation stages. During the offline training phase we ap
proximate the influence of training data on the target model through a distilled
 synset formulated as a reversed gradient matching problem. For online evaluatio
n we expedite the leave-one-out process using the synset which is then utilized
to compute the attribution matrix based on the evaluation objective. Experimenta
l evaluations including training data attribution and assessments of data qualit
y demonstrate that our proposed method achieves comparable model behavior evalua
tion while significantly speeding up the process compared to the direct retraini
ng method.

DistriFusion: Distributed Parallel Inference for High-Resolution Diffusion Model
s
Muyang Li, Tianle Cai, Jiaxin Cao, Qinsheng Zhang, Han Cai, Junjie Bai, Yangqing
 Jia, Kai Li, Song Han; Proceedings of the IEEE/CVF Conference on Computer Visio
n and Pattern Recognition (CVPR), 2024, pp. 7183-7193
Diffusion models have achieved great success in synthesizing high-quality images
. However generating high-resolution images with diffusion models is still chall
enging due to the enormous computational costs resulting in a prohibitive latenc
y for interactive applications. In this paper we propose DistriFusion to tackle
this problem by leveraging parallelism across multiple GPUs. Our method splits t
he model input into multiple patches and assigns each patch to a GPU. However na
ively implementing such an algorithm breaks the interaction between patches and
loses fidelity while incorporating such an interaction will incur tremendous com
munication overhead. To overcome this dilemma we observe the high similarity bet
ween the input from adjacent diffusion steps and propose Displaced Patch Paralle
lism which takes advantage of the sequential nature of the diffusion process by
reusing the pre-computed feature maps from the previous timestep to provide cont
ext for the current step. Therefore our method supports asynchronous communicati
on which can be pipelined by computation. Extensive experiments show that our me
thod can be applied to recent Stable Diffusion XL with no quality degradation an
d achieve up to a 6.1x speedup on eight NVIDIA A100s compared to one. Our code i
s publicly available at https://github.com/mit-han-lab/distrifuser.

Improving the Generalization of Segmentation Foundation Model under Distribution

Shift via Weakly Supervised Adaptation
Haojie Zhang, Yongyi Su, Xun Xu, Kui Jia; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 23385-23395
The success of large language models has inspired the computer vision community to explore image segmentation foundation model that is able to zero/few-shot generalize through prompt engineering. Segment-Anything (SAM) among others is the state-of-the-art image segmentation foundation model demonstrating strong zero/few-shot generalization. Despite the success recent studies reveal the weakness of SAM under strong distribution shift. In particular SAM performs awkwardly on corrupted natural images camouflaged images medical images etc. Motivated by the observations we aim to develop a self-training based strategy to adapt SAM to target distribution. Given the unique challenges of large source dataset high computation cost and incorrect pseudo label we propose a weakly supervised self-training architecture with anchor regularization and low-rank finetuning to improve the robustness and computation efficiency of adaptation. We validate the effectiveness on 5 types of downstream segmentation tasks including natural clean/corrupted images medical images camouflaged images and robotic images. Our proposed method is task-agnostic in nature and outperforms pre-trained SAM and state-of-the-art domain adaptation methods on almost all downstream tasks with the same testing prompt inputs.

Pseudo Label Refinery for Unsupervised Domain Adaptation on Cross-dataset 3D Object Detection
Zhanwei Zhang, Minghao Chen, Shuai Xiao, Liang Peng, Hengjia Li, Binbin Lin, Ping Li, Wenxiao Wang, Boxi Wu, Deng Cai; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 15291-15300
Recent self-training techniques have shown notable improvements in unsupervised domain adaptation for 3D object detection (3D UDA). These techniques typically select pseudo labels i.e. 3D boxes to supervise models for the target domain. However this selection process inevitably introduces unreliable 3D boxes in which 3D points cannot be definitively assigned as foreground or background. Previous techniques mitigate this by reweighting these boxes as pseudo labels but these boxes can still poison the training process. To resolve this problem in this paper we propose a novel pseudo label refinery framework. Specifically in the selection process to improve the reliability of pseudo boxes we propose a complementary augmentation strategy. This strategy involves either removing all points within an unreliable box or replacing it with a high-confidence box. Moreover the point numbers of instances in high-beam datasets are considerably higher than those in low-beam datasets also degrading the quality of pseudo labels during the training process. We alleviate this issue by generating additional proposals and aligning RoI features across different domains. Experimental results demonstrate that our method effectively enhances the quality of pseudo labels and consistently surpasses the state-of-the-art methods on six autonomous driving benchmarks. Code will be available at https://github.com/Zhanwei-Z/PERE.

Reconstructing Hands in 3D with Transformers
Georgios Pavlakos, Dandan Shan, Ilija Radosavovic, Angjoo Kanazawa, David Fouhey, Jitendra Malik; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 9826-9836
We present an approach that can reconstruct hands in 3D from monocular input. Our approach for Hand Mesh Recovery HaMeR follows a fully transformer-based architecture and can analyze hands with significantly increased accuracy and robustness compared to previous work. The key to HaMeR's success lies in scaling up both the data used for training and the capacity of the deep network for hand reconstruction. For training data we combine multiple datasets that contain 2D or 3D hand annotations. For the deep model we use a large scale Vision Transformer architecture. Our final model consistently outperforms the previous baselines on popular 3D hand pose benchmarks. To further evaluate the effect of our design in non-controlled settings we annotate existing in-the-wild datasets with 2D hand keypoint annotations. On this newly collected dataset of annotations HInt we demonst

rate significant improvements over existing baselines. We will make our code dat a and models publicly available upon publication. We make our code data and mode ls available on the project website: https://geopavlakos.github.io/hamer/.

AZ-NAS: Assembling Zero-Cost Proxies for Network Architecture Search
Junghyup Lee, Bumsub Ham; Proceedings of the IEEE/CVF Conference on Computer Vis ion and Pattern Recognition (CVPR), 2024, pp. 5893-5903
Training-free network architecture search (NAS) aims to discover high-performing networks with zero-cost proxies capturing network characteristics related to th e final performance. However network rankings estimated by previous training-fre e NAS methods have shown weak correlations with the performance. To address this issue we propose AZ-NAS a novel approach that leverages the ensemble of various zero-cost proxies to enhance the correlation between a predicted ranking of net works and the ground truth substantially in terms of the performance. To achieve this we introduce four novel zero-cost proxies that are complementary to each o ther analyzing distinct traits of architectures in the views of expressivity pro gressivity trainability and complexity. The proxy scores can be obtained simulta neously within a single forward and backward pass making an overall NAS process highly efficient. In order to integrate the rankings predicted by our proxies ef fectively we introduce a non-linear ranking aggregation method that highlights t he networks highly-ranked consistently across all the proxies. Experimental resu lts conclusively demonstrate the efficacy and efficiency of AZ-NAS outperforming state-of-the-art methods on standard benchmarks all while maintaining a reasona ble runtime cost.

Correspondence-Free Non-Rigid Point Set Registration Using Unsupervised Clusteri ng Analysis
Mingyang Zhao, Jingen Jiang, Lei Ma, Shiqing Xin, Gaofeng Meng, Dong-Ming Yan; P roceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 21199-21208
This paper presents a novel non-rigid point set registration method that is insp ired by unsupervised clustering analysis. Unlike previous approaches that treat the source and target point sets as separate entities we develop a holistic fram ework where they are formulated as clustering centroids and clustering members s eparately. We then adopt Tikhonov regularization with an ?1-induced Laplacian ke rnel instead of the commonly used Gaussian kernel to ensure smooth and more robu st displacement fields. Our formulation delivers closed-form solutions theoretic al guarantees independence from dimensions and the ability to handle large defor mations. Subsequently we introduce a clustering-improved Nystrom method to effec tively reduce the computational complexity and storage of the Gram matrix to lin ear while providing a rigorous bound for the low rank approximation. Our method achieves high accuracy results across various scenarios and surpasses competitor s by a significant margin particularly on shapes with substantial deformations. Additionally we demonstrate the versatility of our method in challenging tasks s uch as shape transfer and medical registration.

Improving Physics-Augmented Continuum Neural Radiance Field-Based Geometry-Agnos tic System Identification with Lagrangian Particle Optimization
Takuhiro Kaneko; Proceedings of the IEEE/CVF Conference on Computer Vision and P attern Recognition (CVPR), 2024, pp. 5470-5480
Geometry-agnostic system identification is a technique for identifying the geome try and physical properties of an object from video sequences without any geomet ric assumptions. Recently physics-augmented continuum neural radiance fields (PA C-NeRF) has demonstrated promising results for this technique by utilizing a hyb rid Eulerian-Lagrangian representation in which the geometry is represented by t he Eulerian grid representations of NeRF the physics is described by a material point method (MPM) and they are connected via Lagrangian particles. However a no table limitation of PAC-NeRF is that its performance is sensitive to the learnin g of the geometry from the first frames owing to its two-step optimization. Firs t the grid representations are optimized with the first frames of video sequence

s and then the physical properties are optimized through video sequences utilizi ng the fixed first-frame grid representations. This limitation can be critical w hen learning of the geometric structure is difficult for example in a few-shot (sparse view) setting. To overcome this limitation we propose Lagrangian particle optimization (LPO) in which the positions and features of particles are optimiz ed through video sequences in Lagrangian space. This method allows for the optim ization of the geometric structure across the entire video sequence within the p hysical constraints imposed by the MPM. The experimental results demonstrate tha t the LPO is useful for geometric correction and physical identification in spar se-view settings.

BadCLIP: Trigger-Aware Prompt Learning for Backdoor Attacks on CLIP
Jiawang Bai, Kuofeng Gao, Shaobo Min, Shu-Tao Xia, Zhifeng Li, Wei Liu; Proceedi ngs of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR) , 2024, pp. 24239-24250
Contrastive Vision-Language Pre-training known as CLIP has shown promising effec tiveness in addressing downstream image recognition tasks. However recent works revealed that the CLIP model can be implanted with a downstream-oriented backdoo r. On downstream tasks one victim model performs well on clean samples but predi cts a specific target class whenever a specific trigger is present. For injectin g a backdoor existing attacks depend on a large amount of additional data to mal iciously fine-tune the entire pre-trained CLIP model which makes them inapplicab le to data-limited scenarios. In this work motivated by the recent success of le arnable prompts we address this problem by injecting a backdoor into the CLIP mo del in the prompt learning stage. Our method named BadCLIP is built on a novel a nd effective mechanism in backdoor attacks on CLIP i.e. influencing both the ima ge and text encoders with the trigger. It consists of a learnable trigger applie d to images and a trigger-aware context generator such that the trigger can chan ge text features via trigger-aware prompts resulting in a powerful and generaliz able attack. Extensive experiments conducted on 11 datasets verify that the clea n accuracy of BadCLIP is similar to those of advanced prompt learning methods an d the attack success rate is higher than 99% in most cases. BadCLIP is also gene ralizable to unseen classes and shows a strong generalization capability under c ross-dataset and cross-domain settings. The code is available at https://github. com/jiawangbai/BadCLIP.

Beyond Image Super-Resolution for Image Recognition with Task-Driven Perceptual Loss
Jaeha Kim, Junghun Oh, Kyoung Mu Lee; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 2651-2661
In real-world scenarios image recognition tasks such as semantic segmentation an d object detection often pose greater challenges due to the lack of information available within low-resolution (LR) content. Image super-resolution (SR) is one of the promising solutions for addressing the challenges. However due to the il l-posed property of SR it is challenging for typical SR methods to restore task-relevant high-frequency contents which may dilute the advantage of utilizing the SR method. Therefore in this paper we propose Super-Resolution for Image Recogn ition (SR4IR) that effectively guides the generation of SR images beneficial to achieving satisfactory image recognition performance when processing LR images. The critical component of our SR4IR is the task-driven perceptual (TDP) loss tha t enables the SR network to acquire task-specific knowledge from a network tailo red for a specific task. Moreover we propose a cross-quality patch mix and an al ternate training framework that significantly enhances the efficacy of the TDP l oss by addressing potential problems when employing the TDP loss. Through extens ive experiments we demonstrate that our SR4IR achieves outstanding task performa nce by generating SR images useful for a specific image recognition task includi ng semantic segmentation object detection and image classification. The implemen tation code is available at https://github.com/JaehaKim97/SR4IR.

PELA: Learning Parameter-Efficient Models with Low-Rank Approximation

Yangyang Guo, Guangzhi Wang, Mohan Kankanhalli; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 15699-15709
Applying a pre-trained large model to downstream tasks is prohibitive under resource-constrained conditions. Recent dominant approaches for addressing efficiency issues involve adding a few learnable parameters to the fixed backbone model. This strategy however leads to more challenges in loading large models for downstream fine-tuning with limited resources. In this paper we propose a novel method for increasing the parameter efficiency of pre-trained models by introducing an intermediate pre-training stage. To this end we first employ low-rank approximation to compress the original large model and then devise a feature distillation module and a weight perturbation regularization module. These modules are specifically designed to enhance the low-rank model. In particular we update only the low-rank model while freezing the backbone parameters during pre-training. This allows for direct and efficient utilization of the low-rank model for downstream fine-tuning tasks. The proposed method achieves both efficiencies in terms of required parameters and computation time while maintaining comparable results with minimal modifications to the backbone architecture. Specifically when applied to three vision-only and one vision-language Transformer models our approach often demonstrates a merely 0.6-point decrease in performance while reducing the original parameter size by 1/3 to 2/3.

XCube: Large-Scale 3D Generative Modeling using Sparse Voxel Hierarchies
Xuanchi Ren, Jiahui Huang, Xiaohui Zeng, Ken Museth, Sanja Fidler, Francis Williams; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 4209-4219
We present XCube a novel generative model for high-resolution sparse 3D voxel grids with arbitrary attributes. Our model can generate millions of voxels with a finest effective resolution of up to 1024^3 in a feed-forward fashion without time-consuming test-time optimization. To achieve this we employ a hierarchical voxel latent diffusion model which generates progressively higher resolution grids in a coarse-to-fine manner using a custom framework built on the highly efficient VDB data structure. Apart from generating high-resolution objects we demonstrate the effectiveness of XCube on large outdoor scenes at scales of 100m x 100m with a voxel size as small as 10cm. We observe clear qualitative and quantitative improvements over past approaches. In addition to unconditional generation we show that our model can be used to solve a variety of tasks such as user-guided editing scene completion from a single scan and text-to-3D.

PixelRNN: In-pixel Recurrent Neural Networks for End-to-end-optimized Perception with Neural Sensors
Haley M. So, Laurie Bose, Piotr Dudek, Gordon Wetzstein; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 25233-25244
Conventional image sensors digitize high-resolution images at fast frame rates producing a large amount of data that needs to be transmitted off the sensor for further processing. This is challenging for perception systems operating on edge devices because communication is power inefficient and induces latency. Fueled by innovations in stacked image sensor fabrication emerging sensor--processors offer programmability and processing capabilities directly on the sensor. We exploit these capabilities by developing an efficient recurrent neural network architecture PixelRNN that encodes spatio-temporal features on the sensor using purely binary operations. PixelRNN reduces the amount of data to be transmitted off the sensor by factors up to 256 compared to the raw sensor data while offering competitive accuracy for hand gesture recognition and lip reading tasks. We experimentally validate PixelRNN using a prototype implementation on the SCAMP-5 sensor--processor platform.
****
Reconstruction-free Cascaded Adaptive Compressive Sensing
Chenxi Qiu, Tao Yue, Xuemei Hu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 2620-2630

Scene-aware Adaptive Compressive Sensing (ACS) has constituted a persistent pursuit holding substantial promise for the enhancement of Compressive Sensing (CS) performance. Cascaded ACS furnishes a proficient multi-stage framework for adaptively allocating the CS sampling based on previous CS measurements. However reconstruction is commonly required for analyzing and steering the successive CS sampling which bottlenecks the ACS speed and impedes the practical application in time-sensitive scenarios. Addressing this challenge we propose a reconstruction-free cascaded ACS method which requires NO reconstruction during the adaptive sampling process. A lightweight Score Network (ScoreNet) is proposed to directly determine the ACS allocation with previous CS measurements and a differentiable adaptive sampling module is proposed for end-to-end training. For image reconstruction we propose a Multi-Grid Spatial-Attention Network (MGSANet) that could facilitate efficient multi-stage training and inferencing. By introducing the reconstruction-fidelity supervision outside the loop of the multi-stage sampling process ACS can be efficiently optimized and achieve high imaging fidelity. The effectiveness of the proposed method is demonstrated with extensive quantitative and qualitative experiments compared with the state-of-the-art CS algorithms.

Auto-Train-Once: Controller Network Guided Automatic Network Pruning from Scratch

Xidong Wu, Shangqian Gao, Zeyu Zhang, Zhenzhen Li, Runxue Bao, Yanfu Zhang, Xiaoqian Wang, Heng Huang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 16163-16173

Current techniques for deep neural network (DNN) pruning often involve intricate multi-step processes that require domain-specific expertise making their widespread adoption challenging. To address the limitation the Only-Train-Once (OTO) and OTOv2 are proposed to eliminate the need for additional fine-tuning steps by directly training and compressing a general DNN from scratch. Nevertheless the static design of optimizers (in OTO) can lead to convergence issues of local optima. In this paper we proposed the Auto-Train-Once (ATO) an innovative network pruning algorithm designed to automatically reduce the computational and storage costs of DNNs. During the model training phase our approach not only trains the target model but also leverages a controller network as an architecture generator to guide the learning of target model weights. Furthermore we developed a novel stochastic gradient algorithm that enhances the coordination between model training and controller network training thereby improving pruning performance. We provide a comprehensive convergence analysis as well as extensive experiments and the results show that our approach achieves state-of-the-art performance across various model architectures (including ResNet18 ResNet34 ResNet50 ResNet56 and MobileNetv2) on standard benchmark datasets (CIFAR-10 CIFAR-100 and ImageNet).

Constructing and Exploring Intermediate Domains in Mixed Domain Semi-supervised Medical Image Segmentation

Qinghe Ma, Jian Zhang, Lei Qi, Qian Yu, Yinghuan Shi, Yang Gao; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 11642-11651

Both limited annotation and domain shift are prevalent challenges in medical image segmentation. Traditional semi-supervised segmentation and unsupervised domain adaptation methods address one of these issues separately. However the coexistence of limited annotation and domain shift is quite common which motivates us to introduce a novel and challenging scenario: Mixed Domain Semi-supervised medical image Segmentation (MiDSS). In this scenario we handle data from multiple medical centers with limited annotations available for a single domain and a large amount of unlabeled data from multiple domains. We found that the key to solving the problem lies in how to generate reliable pseudo labels for the unlabeled data in the presence of domain shift with labeled data. To tackle this issue we employ Unified Copy-Paste (UCP) between images to construct intermediate domains facilitating the knowledge transfer from the domain of labeled data to the domains of unlabeled data. To fully utilize the information within the intermediate domain we propose a symmetric Guidance training strategy (SymGD) which additionall

y offers direct guidance to unlabeled data by merging pseudo labels from interme
diate samples. Subsequently we introduce a Training Process aware Random Amplitu
de MixUp (TP-RAM) to progressively incorporate style-transition components into
intermediate samples. Compared with existing state-of-the-art approaches our met
hod achieves a notable 13.57% improvement in Dice score on Prostate dataset as d
emonstrated on three public datasets. Our code is available at https://github.co
m/MQinghe/MiDSS

DUSt3R: Geometric 3D Vision Made Easy
Shuzhe Wang, Vincent Leroy, Yohann Cabon, Boris Chidlovskii, Jerome Revaud; Proc
eedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (C
VPR), 2024, pp. 20697-20709
Multi-view stereo reconstruction (MVS) in the wild requires to first estimate th
e camera intrinsic and extrinsic parameters. These are usually tedious and cumbe
rsome to obtain yet they are mandatory to triangulate corresponding pixels in 3D
 space which is at the core of all best performing MVS algorithms. In this work
we take an opposite stance and introduce DUSt3R a radically novel paradigm for D
ense and Unconstrained Stereo 3D Reconstruction of arbitrary image collections o
perating without prior information about camera calibration nor viewpoint poses.
 We cast the pairwise reconstruction problem as a regression of pointmaps relaxi
ng the hard constraints of usual projective camera models. We show that this for
mulation smoothly unifies the monocular and binocular reconstruction cases. In t
he case where more than two images are provided we further propose a simple yet
effective global alignment strategy that expresses all pairwise pointmaps in a c
ommon reference frame. We base our network architecture on standard Transformer
encoders and decoders allowing us to leverage powerful pretrained models. Our fo
rmulation directly provides a 3D model of the scene as well as depth information
 but interestingly we can seamlessly recover from it pixel matches focal lengths
 relative and absolute cameras. Extensive experiments on all these tasks showcas
e how DUSt3R effectively unifies various 3D vision tasks setting new performance
 records on monocular & multi-view depth estimation as well as relative pose est
imation. In summary DUSt3R makes many geometric 3D vision tasks easy. Code and m
odels at https://github.com/naver/dust3r

From Isolated Islands to Pangea: Unifying Semantic Space for Human Action Unders
tanding
Yong-Lu Li, Xiaoqian Wu, Xinpeng Liu, Zehao Wang, Yiming Dou, Yikun Ji, Junyi Zh
ang, Yixing Li, Xudong Lu, Jingru Tan, Cewu Lu; Proceedings of the IEEE/CVF Conf
erence on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 16582-16592
Action understanding matters for intelligent agents and has attracted long-term
attention. It can be formed as the mapping from the action physical space to the
 semantic space. Typically researchers built action datasets according to idiosy
ncratic choices to define classes and push the envelope of benchmarks respective
ly. Thus datasets are incompatible with each other like "Isolated Islands" due t
o semantic gaps and various class granularities e.g. do housework in dataset A a
nd wash plate in dataset B. We argue that a more principled semantic space is an
 urgent need to concentrate the community efforts and enable us to use all datas
ets together to pursue generalizable action learning. To this end we design a st
ructured action semantic space in view of verb taxonomy hierarchy and covering m
assive actions. By aligning the classes of previous datasets to our semantic spa
ce we gather (image/video/skeleton/MoCap) datasets into a unified database in a
unified label system i.e. bridging "isolated islands" into a "Pangea". According
ly we propose a novel model mapping from the physical space to semantic space to
 fully use Pangea. In extensive experiments our new system shows significant sup
eriority especially in transfer learning. Our code and data will be made public
at https://mvig-rhos.com/pangea.

Bootstrapping Autonomous Driving Radars with Self-Supervised Learning
Yiduo Hao, Sohrab Madani, Junfeng Guan, Mohammed Alloulah, Saurabh Gupta, Haitha
m Hassanieh; Proceedings of the IEEE/CVF Conference on Computer Vision and Patte

rn Recognition (CVPR), 2024, pp. 15012-15023
The perception of autonomous vehicles using radars has attracted increased resea rch interest due its ability to operate in fog and bad weather. However training radar models is hindered by the cost and difficulty of annotating large-scale r adar data. To overcome this bottleneck we propose a self-supervised learning fra mework to leverage the large amount of unlabeled radar data to pre-train radar-o nly embeddings for self-driving perception tasks. The proposed method combines r adar-to-radar and radar-to-vision contrastive losses to learn a general represen tation from unlabeled radar heatmaps paired with their corresponding camera imag es. When used for downstream object detection we demonstrate that the proposed s elf-supervision framework can improve the accuracy of state-of-the-art supervise d baselines by 5.8% in mAP. Code is available at https://github.com/yiduohao/Rad ical.
****
Robust Distillation via Untargeted and Targeted Intermediate Adversarial Samples
Junhao Dong, Piotr Koniusz, Junxi Chen, Z. Jane Wang, Yew-Soon Ong; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 20 24, pp. 28432-28442
Adversarially robust knowledge distillation aims to compress large-scale models into lightweight models while preserving adversarial robustness and natural perf ormance on a given dataset. Existing methods typically align probability distrib utions of natural and adversarial samples between teacher and student models but they overlook intermediate adversarial samples along the "adversarial path" for med by the multi-step gradient ascent of a sample towards the decision boundary. Such paths capture rich information about the decision boundary. In this paper we propose a novel adversarially robust knowledge distillation approach by incor porating such adversarial paths into the alignment process. Recognizing the dive rse impacts of intermediate adversarial samples (ranging from benign to noisy) w e propose an adaptive weighting strategy to selectively emphasize informative ad versarial samples thus ensuring efficient utilization of lightweight model capac ity. Moreover we propose a dual-branch mechanism exploiting two following insigh ts: (i) complementary dynamics of adversarial paths obtained by targeted and unt argeted adversarial learning and (ii) inherent differences between the gradient ascent path from class c_i towards the nearest class boundary and the gradient d escent path from a specific class c_j towards the decision region of c_i (i \neq j). Comprehensive experiments demonstrate the effectiveness of our method on li ghtweight models under various settings.

USE: Universal Segment Embeddings for Open-Vocabulary Image Segmentation
Xiaoqi Wang, Wenbin He, Xiwei Xuan, Clint Sebastian, Jorge Piazentin Ono, Xin Li , Sima Behpour, Thang Doan, Liang Gou, Han-Wei Shen, Liu Ren; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp . 4187-4196
The open-vocabulary image segmentation task involves partitioning images into se mantically meaningful segments and classifying them with flexible text-defined c ategories. The recent vision-based foundation models such as the Segment Anythin g Model (SAM) have shown superior performance in generating class-agnostic image segments. The main challenge in open-vocabulary image segmentation now lies in accurately classifying these segments into text-defined categories. In this pape r we introduce the Universal Segment Embedding (USE) framework to address this c hallenge. This framework is comprised of two key components: 1) a data pipeline designed to efficiently curate a large amount of segment-text pairs at various g ranularities and 2) a universal segment embedding model that enables precise seg ment classification into a vast range of text-defined categories. The USE model can not only help open-vocabulary image segmentation but also facilitate other d ownstream tasks (e.g. querying and ranking). Through comprehensive experimental studies on semantic segmentation and part segmentation benchmarks we demonstrate that the USE framework outperforms state-of-the-art open-vocabulary segmentatio n methods.

Functional Diffusion
Biao Zhang, Peter Wonka; Proceedings of the IEEE/CVF Conference on Computer Visi
on and Pattern Recognition (CVPR), 2024, pp. 4723-4732
We propose functional diffusion a generative diffusion model focused on infinite
-dimensional function data samples. In contrast to previous work functional diff
usion works on samples that are represented by functions with a continuous domai
n. Functional diffusion can be seen as an extension of classical diffusion model
s to an infinite-dimensional domain. Functional diffusion is very versatile as i
mages videos audio 3D shapes deformations etc. can be handled by the same framew
ork with minimal changes. In addition functional diffusion is especially suited
for irregular data or data defined in non-standard domains. In our work we deriv
e the necessary foundations for functional diffusion and propose a first impleme
ntation based on the transformer architecture. We show generative results on com
plicated signed distance functions and deformation functions defined on 3D surfa
ces.

Soften to Defend: Towards Adversarial Robustness via Self-Guided Label Refinemen
t
Zhuorong Li, Daiwei Yu, Lina Wei, Canghong Jin, Yun Zhang, Sixian Chan; Proceedi
ngs of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR)
, 2024, pp. 24776-24785
Adversarial training (AT) is currently one of the most effective ways to obtain
the robustness of deep neural networks against adversarial attacks. However most
 AT methods suffer from robust overfitting i.e. a significant generalization gap
 in adversarial robustness between the training and testing curves. In this pape
r we first identify a connection between robust overfitting and the excessive me
morization of noisy labels in AT from a view of gradient norm. As such label noi
se is mainly caused by a distribution mismatch and improper label assignments we
 are motivated to propose a label refinement approach for AT. Specifically our S
elf-Guided Label Refinement first self-refines a more accurate and informative l
abel distribution from over-confident hard labels and then it calibrates the tra
ining by dynamically incorporating knowledge from self-distilled models into the
 current model and thus requiring no external teachers. Empirical results demons
trate that our method can simultaneously boost the standard accuracy and robust
performance across multiple benchmark datasets attack types and architectures. I
n addition we also provide a set of analyses from the perspectives of informatio
n theory to dive into our method and suggest the importance of soft labels for r
obust generalization.

Weakly Supervised Monocular 3D Detection with a Single-View Image
Xueying Jiang, Sheng Jin, Lewei Lu, Xiaoqin Zhang, Shijian Lu; Proceedings of th
e IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, p
p. 10508-10518
Monocular 3D detection (M3D) aims for precise 3D object localization from a sing
le-view image which usually involves labor-intensive annotation of 3D detection
boxes. Weakly supervised M3D has recently been studied to obviate the 3D annotat
ion process by leveraging many existing 2D annotations but it often requires ext
ra training data such as LiDAR point clouds or multi-view images which greatly d
egrades its applicability and usability in various applications. We propose SKD-
WM3D a weakly supervised monocular 3D detection framework that exploits depth in
formation to achieve M3D with a single-view image exclusively without any 3D ann
otations or other training data. One key design in SKD-WM3D is a self-knowledge
distillation framework which transforms image features into 3D-like representati
ons by fusing depth information and effectively mitigates the inherent depth amb
iguity in monocular scenarios with little computational overhead in inference. I
n addition we design an uncertainty-aware distillation loss and a gradient-targe
ted transfer modulation strategy which facilitate knowledge acquisition and know
ledge transfer respectively. Extensive experiments show that SKD-WM3D surpasses
the state-of-the-art clearly and is even on par with many fully supervised metho
ds.

Pose-Guided Self-Training with Two-Stage Clustering for Unsupervised Landmark Di
scovery
Siddharth Tourani, Ahmed Alwheibi, Arif Mahmood, Muhammad Haris Khan; Proceeding
s of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR),
2024, pp. 23041-23051
Unsupervised landmarks discovery (ULD) for an object category is a challenging c
omputer vision problem. In pursuit of developing a robust ULD framework we explo
re the potential of a recent paradigm of self-supervised learning algorithms kno
wn as diffusion models. Some recent works have shown that these models implicitl
y contain important correspondence cues. Towards harnessing the potential of dif
fusion models for ULD task we make the following core contributions. First we pr
opose a ZeroShot ULD baseline based on simple clustering of random pixel locatio
ns with nearest neighbour matching. It delivers better results than the existing
 ULD methods. Second motivated by the ZeroShot performance we develop a ULD algo
rithm based on diffusion features using self-training and clustering which also
outperforms prior methods by notable margins. Third we introduce a new proxy tas
k based on generating latent pose codes and also propose a two-stage clustering
mechanism to facilitate effective pseudo-labeling resulting in a significant per
formance improvement. Overall our approach consistently outperforms state-of-the
-art methods on four challenging benchmarks AFLW MAFL CatHeads and LS3D by signi
ficant margins.

Learning from Synthetic Human Group Activities
Che-Jui Chang, Danrui Li, Deep Patel, Parth Goel, Honglu Zhou, Seonghyeon Moon,
Samuel S. Sohn, Sejong Yoon, Vladimir Pavlovic, Mubbasir Kapadia; Proceedings of
 the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024
, pp. 21922-21932
The study of complex human interactions and group activities has become a focal
point in human-centric computer vision. However progress in related tasks is oft
en hindered by the challenges of obtaining large-scale labeled datasets from rea
l-world scenarios. To address the limitation we introduce M3Act a synthetic data
 generator for multi-view multi-group multi-person human atomic actions and grou
p activities. Powered by Unity Engine M3Act features multiple semantic groups hi
ghly diverse and photorealistic images and a comprehensive set of annotations wh
ich facilitates the learning of human-centered tasks across single-person multi-
person and multi-group conditions. We demonstrate the advantages of M3Act across
 three core experiments. The results suggest our synthetic dataset can significa
ntly improve the performance of several downstream methods and replace real-worl
d datasets to reduce cost. Notably M3Act improves the state-of-the-art MOTRv2 on
 DanceTrack dataset leading to a hop on the leaderboard from 10th to 2nd place.
Moreover M3Act opens new research for controllable 3D group activity generation.
 We define multiple metrics and propose a competitive baseline for the novel tas
k. Our code and data are available at our project page: http://cjerry1243.github
.io/M3Act.

Blind Image Quality Assessment Based on Geometric Order Learning
Nyeong-Ho Shin, Seon-Ho Lee, Chang-Su Kim; Proceedings of the IEEE/CVF Conferenc
e on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 12799-12808
A novel approach to blind image quality assessment called quality comparison net
work (QCN) is proposed in this paper which sorts the feature vectors of input im
ages according to their quality scores in an embedding space. QCN employs compar
ison transformers (CTs) and score pivots which act as the centroids of feature v
ectors of similar-quality images. Each CT updates the score pivots and the featu
re vectors of input images based on their ordered correlation. To this end we ad
opt four loss functions. Then we estimate the quality score of a test image by s
earching the nearest score pivot to its feature vector in the embedding space. E
xtensive experiments show that the proposed QCN algorithm yields excellent image
 quality assessment performances on various datasets. Furthermore QCN achieves g
reat performances in cross-dataset evaluation demonstrating its superb generaliz

ation capability. The source codes are available at https://github.com/nhshin-mc
l/QCN.

Text Grouping Adapter: Adapting Pre-trained Text Detector for Layout Analysis
Tianci Bi, Xiaoyi Zhang, Zhizheng Zhang, Wenxuan Xie, Cuiling Lan, Yan Lu, Nanni
ng Zheng; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern
Recognition (CVPR), 2024, pp. 28150-28159
Significant progress has been made in scene text detection models since the rise
 of deep learning but scene text layout analysis which aims to group detected te
xt instances as paragraphs has not kept pace. Previous works either treated text
 detection and grouping using separate models or train a model from scratch whil
e using a unified one. All of them have not yet made full use of the already wel
l-trained text detectors and easily obtainable detection datasets. In this paper
 we present Text Grouping Adapter (TGA) a module that can enable the utilization
 of various pre-trained text detectors to learn layout analysis allowing us to a
dopt a well-trained text detector right off the shelf or just fine-tune it effic
iently. Designed to be compatible with various text detector architectures TGA t
akes detected text regions and image features as universal inputs to assemble te
xt instance features. To capture broader contextual information for layout analy
sis we propose to predict text group masks from text instance features by one-to
-many assignment. Our comprehensive experiments demonstrate that even with froze
n pre-trained models incorporating our TGA into various pre-trained text detecto
rs and text spotters can achieve superior layout analysis performance simultaneo
usly inheriting generalized text detection ability from pre-training. In the cas
e of full parameter fine-tuning we can further improve layout analysis performan
ce.

Generalizable Whole Slide Image Classification with Fine-Grained Visual-Semantic
 Interaction
Hao Li, Ying Chen, Yifei Chen, Rongshan Yu, Wenxian Yang, Liansheng Wang, Bowen
Ding, Yuchen Han; Proceedings of the IEEE/CVF Conference on Computer Vision and
Pattern Recognition (CVPR), 2024, pp. 11398-11407
Whole Slide Image (WSI) classification is often formulated as a Multiple Instanc
e Learning (MIL) problem. Recently Vision-Language Models (VLMs) have demonstrat
ed remarkable performance in WSI classification. However existing methods levera
ge coarse-grained pathogenetic descriptions for visual representation supervisio
n which are insufficient to capture the complex visual appearance of pathogeneti
c images hindering the generalizability of models on diverse downstream tasks. A
dditionally processing high-resolution WSIs can be computationally expensive. In
 this paper we propose a novel "Fine-grained Visual-Semantic Interaction" (FiVE)
 framework for WSI classification. It is designed to enhance the model's general
izability by leveraging the interaction between localized visual patterns and fi
ne-grained pathological semantics. Specifically with meticulously designed queri
es we start by utilizing a large language model to extract fine-grained patholog
ical descriptions from various non-standardized raw reports. The output descript
ions are then reconstructed into fine-grained labels used for training. By intro
ducing a Task-specific Fine-grained Semantics (TFS) module we enable prompts to
capture crucial visual information in WSIs which enhances representation learnin
g and augments generalization capabilities significantly. Furthermore given that
 pathological visual patterns are redundantly distributed across tissue slices w
e sample a subset of visual instances during training. Our method demonstrates r
obust generalizability and strong transferability dominantly outperforming the c
ounterparts on the TCGA Lung Cancer dataset with at least 9.19% higher accuracy
in few-shot experiments. The code is available at: https://github.com/ls1rius/WS
I_FiVE.

THRONE: An Object-based Hallucination Benchmark for the Free-form Generations of
 Large Vision-Language Models
Prannay Kaul, Zhizhong Li, Hao Yang, Yonatan Dukler, Ashwin Swaminathan, C. J. T
aylor, Stefano Soatto; Proceedings of the IEEE/CVF Conference on Computer Vision

and Pattern Recognition (CVPR), 2024, pp. 27228-27238
Mitigating hallucinations in large vision-language models (LVLMs) remains an ope
n problem. Recent benchmarks do not address hallucinations in open-ended free-fo
rm responses which we term "Type I hallucinations". Instead they focus on halluc
inations responding to very specific question formats---typically a multiple-cho
ice response regarding a particular object or attribute---which we term "Type II
 hallucinations". Additionally such benchmarks often require external API calls
to models which are subject to change. In practice we observe that a reduction i
n Type II hallucinations does not lead to a reduction in Type I hallucinations b
ut rather that the two forms of hallucinations are often anti-correlated. To add
ress this we propose THRONE a novel object-based automatic framework for quantit
atively evaluating Type I hallucinations in LVLM free-form outputs. We use publi
c language models (LMs) to identify hallucinations in LVLM responses and compute
 informative metrics. By evaluating a large selection of recent LVLMs using publ
ic datasets we show that an improvement in existing metrics do not lead to a red
uction in Type I hallucinations and that established benchmarks for measuring Ty
pe I hallucinations are incomplete. Finally we provide a simple and effective da
ta augmentation method to reduce Type I and Type II hallucinations as a strong b
aseline.

Wired Perspectives: Multi-View Wire Art Embraces Generative AI
Zhiyu Qu, Lan Yang, Honggang Zhang, Tao Xiang, Kaiyue Pang, Yi-Zhe Song; Proceed
ings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR
), 2024, pp. 6149-6158
Creating multi-view wire art (MVWA) a static 3D sculpture with diverse interpret
ations from different viewpoints is a complex task even for skilled artists. In
response we present DreamWire an AI system enabling everyone to craft MVWA easil
y. Users express their vision through text prompts or scribbles freeing them fro
m intricate 3D wire organisation. Our approach synergises 3D Bezier curves Prim'
s algorithm and knowledge distillation from diffusion models or their variants (
e.g. ControlNet). This blend enables the system to represent 3D wire art ensurin
g spatial continuity and overcoming data scarcity. Extensive evaluation and anal
ysis are conducted to shed insight on the inner workings of the proposed system
including the trade-off between connectivity and visual aesthetics.

LUWA Dataset: Learning Lithic Use-Wear Analysis on Microscopic Images
Jing Zhang, Irving Fang, Hao Wu, Akshat Kaushik, Alice Rodriguez, Hanwen Zhao, J
uexiao Zhang, Zhuo Zheng, Radu Iovita, Chen Feng; Proceedings of the IEEE/CVF Co
nference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 22563-2257
3
Lithic Use-Wear Analysis (LUWA) using microscopic images is an underexplored vis
ion-for-science research area. It seeks to distinguish the worked material which
 is critical for understanding archaeological artifacts material interactions to
ol functionalities and dental records. However this challenging task goes beyond
 the well-studied image classification problem for common objects. It is affecte
d by many confounders owing to the complex wear mechanism and microscopic imagin
g which makes it difficult even for human experts to identify the worked materia
l successfully. In this paper we investigate the following three questions on th
is unique vision task for the first time:(i) How well can state-of-the-art pre-t
rained models (like DINOv2) generalize to the rarely seen domain? (ii) How can f
ew-shot learning be exploited for scarce microscopic images? (iii) How do the am
biguous magnification and sensing modality influence the classification accuracy
? To study these we collaborated with archaeologists and built the first open-so
urce and the largest LUWA dataset containing 23130 microscopic images with diffe
rent magnifications and sensing modalities. Extensive experiments show that exis
ting pre-trained models notably outperform human experts but still leave a large
 gap for improvements. Most importantly the LUWA dataset provides an underexplor
ed opportunity for vision and learning communities and complements existing imag
e classification problems on common objects.

Generalizing 6-DoF Grasp Detection via Domain Prior Knowledge
Haoxiang Ma, Modi Shi, Boyang Gao, Di Huang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 18102-18111
We focus on the generalization ability of the 6-DoF grasp detection method in this paper. While learning-based grasp detection methods can predict grasp poses for unseen objects using the grasp distribution learned from the training set they often exhibit a significant performance drop when encountering objects with diverse shapes and structures. To enhance the grasp detection methods' generalization ability we incorporate domain prior knowledge of robotic grasping enabling better adaptation to objects with significant shape and structure differences. More specifically we employ the physical constraint regularization during the training phase to guide the model towards predicting grasps that comply with the physical rule on grasping. For the unstable grasp poses predicted on novel objects we design a contact-score joint optimization using the projection contact map to refine these poses in cluttered scenarios. Extensive experiments conducted on the GraspNet-1billion benchmark demonstrate a substantial performance gain on the novel object set and the real-world grasping experiments also demonstrate the effectiveness of our generalizing 6-DoF grasp detection method.

The Audio-Visual Conversational Graph: From an Egocentric-Exocentric Perspective
Wenqi Jia, Miao Liu, Hao Jiang, Ishwarya Ananthabhotla, James M. Rehg, Vamsi Krishna Ithapu, Ruohan Gao; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 26396-26405
In recent years the thriving development of research related to egocentric videos has provided a unique perspective for the study of conversational interactions where both visual and audio signals play a crucial role. While most prior work focus on learning about behaviors that directly involve the camera wearer we introduce the Ego-Exocentric Conversational Graph Prediction problem marking the first attempt to infer exocentric conversational interactions from egocentric videos. We propose a unified multi-modal framework---Audio-Visual Conversational Attention (AV-CONV) for the joint prediction of conversation behaviors---speaking and listening---for both the camera wearer as well as all other social partners present in the egocentric video. Specifically we adopt the self-attention mechanism to model the representations across-time across-subjects and across-modalities. To validate our method we conduct experiments on a challenging egocentric video dataset that includes multi-speaker and multi-conversation scenarios. Our results demonstrate the superior performance of our method compared to a series of baselines. We also present detailed ablation studies to assess the contribution of each component in our model. Check our \href https://vjwq.github.io/AV-CONV/ Project Page .

Byzantine-robust Decentralized Federated Learning via Dual-domain Clustering and Trust Bootstrapping
Peng Sun, Xinyang Liu, Zhibo Wang, Bo Liu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 24756-24765
Decentralized federated learning (DFL) facilitates collaborative model training across multiple connected clients without a central coordination server thereby avoiding the single point of failure in traditional centralized federated learning (CFL). However DFL exhibits heightened susceptibility to Byzantine attacks owing to the lack of a responsible central server. Furthermore a benign client in DFL may be dominated by Byzantine clients (more than half of its neighbors are malicious) posing significant challenges for robust model training. In this work we propose DFL-Dual a novel Byzantine-robust DFL method through dual-domain client clustering and trust bootstrapping. Specifically we first propose to leverage both data-domain and model-domain distance metrics to identify client discrepancies. Then we design a trust evaluation mechanism centered on benign clients which enables them to evaluate their neighbors. Building upon the dual-domain distance metric and trust evaluation mechanism we further develop a two-stage clustering and trust bootstrapping technique to exclude Byzantine clients from local model aggregation. We extensively evaluate the proposed DFL-Dual method through ri

gorous experimentation demonstrating its remarkable performance superiority over existing robust CFL and DFL schemes.
****
Leveraging Camera Triplets for Efficient and Accurate Structure-from-Motion
Lalit Manam, Venu Madhav Govindu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 4959-4968
In Structure-from-Motion (SfM) the underlying viewgraphs of unordered image collections generally have a highly redundant set of edges that can be sparsified for efficiency without significant loss of reconstruction quality. Often there are also false edges due to incorrect image retrieval and repeated structures (symmetries) that give rise to ghosting and superimposed reconstruction artifacts. We present a unified method to simultaneously sparsify the viewgraph and remove false edges. We propose a scoring mechanism based on camera triplets that identifies edge redundancy as well as false edges. Our edge selection is formulated as an optimization problem which can be provably solved using a simple thresholding scheme. This results in a highly efficient algorithm which can be incorporated as a pre-processing step into any SfM pipeline making it practically usable. We demonstrate the utility of our method on generic and ambiguous datasets that cover the range of small medium and large-scale datasets all with different statistical properties. Sparsification of generic datasets using our method significantly reduces reconstruction time while maintaining the accuracy of the reconstructions as well as removing ghosting artifacts. For ambiguous datasets our method removes false edges thereby avoiding incorrect superimposed reconstructions.

SimDA: Simple Diffusion Adapter for Efficient Video Generation
Zhen Xing, Qi Dai, Han Hu, Zuxuan Wu, Yu-Gang Jiang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 7827-7839
The recent wave of AI-generated content has witnessed the great development and success of Text-to-Image (T2I) technologies. By contrast Text-to-Video (T2V) still falls short of expectations though attracting increasing interest. Existing works either train from scratch or adapt large T2I model to videos both of which are computation and resource expensive. In this work we propose a Simple Diffusion Adapter (SimDA) that fine-tunes only 24M out of 1.1B parameters of a strong T2I model adapting it to video generation in a parameter-efficient way. In particular we turn the T2I model for T2V by designing light-weight spatial and temporal adapters for transfer learning. Besides we change the original spatial attention to the proposed Latent-Shift Attention (LSA) for temporal consistency. With a similar model architecture we further train a video super-resolution model to generate high-definition (1024 x 1024) videos. In addition to T2V generation in the wild SimDA could also be utilized in one-shot video editing with only 2 minutes tuning. Doing so our method could minimize the training effort with extremely few tunable parameters for model adaptation.

Multi-view Aggregation Network for Dichotomous Image Segmentation
Qian Yu, Xiaoqi Zhao, Youwei Pang, Lihe Zhang, Huchuan Lu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 3921-3930
Dichotomous Image Segmentation (DIS) has recently emerged towards high-precision object segmentation from high-resolution natural images. When designing an effective DIS model the main challenge is how to balance the semantic dispersion of high-resolution targets in the small receptive field and the loss of high-precision details in the large receptive field. Existing methods rely on tedious multiple encoder-decoder streams and stages to gradually complete the global localization and local refinement. Human visual system captures regions of interest by observing them from multiple views. Inspired by it we model DIS as a multi-view object perception problem and provide a parsimonious multi-view aggregation network (MVANet) which unifies the feature fusion of the distant view and close-up view into a single stream with one encoder-decoder structure. With the help of the proposed multi-view complementary localization and refinement modules our appro

ach established long-range profound visual interactions across multiple views allowing the features of the detailed close-up view to focus on highly slender structures. Experiments on the popular DIS-5K dataset show that our MVANet significantly outperforms state-of-the-art methods in both accuracy and speed. The source code and datasets will be publicly available at \href https://github.com/qianyu-dlut/MVANet MVANet .

A Recipe for Scaling up Text-to-Video Generation with Text-free Videos
Xiang Wang, Shiwei Zhang, Hangjie Yuan, Zhiwu Qing, Biao Gong, Yingya Zhang, Yujun Shen, Changxin Gao, Nong Sang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 6572-6582
Diffusion-based text-to-video generation has witnessed impressive progress in the past year yet still falls behind text-to-image generation. One of the key reasons is the limited scale of publicly available data (e.g. 10M video-text pairs in WebVid10M vs. 5B image-text pairs in LAION) considering the high cost of video captioning. Instead it could be far easier to collect unlabeled clips from video platforms like YouTube. Motivated by this we come up with a novel text-to-video generation framework termed TF-T2V which can directly learn with text-free videos. The rationale behind is to separate the process of text decoding from that of temporal modeling. To this end we employ a content branch and a motion branch which are jointly optimized with weights shared. Following such a pipeline we study the effect of doubling the scale of training set (i.e. video-only WebVid10M) with some randomly collected text-free videos and are encouraged to observe the performance improvement (FID from 9.67 to 8.19 and FVD from 484 to 441) demonstrating the scalability of our approach. We also find that our model could enjoy sustainable performance gain (FID from 8.19 to 7.64 and FVD from 441 to 366) after reintroducing some text labels for training. Finally we validate the effectiveness and generalizability of our ideology on both native text-to-video generation and compositional video synthesis paradigms. Code and models will be publicly available at here.

Molecular Data Programming: Towards Molecule Pseudo-labeling with Systematic Weak Supervision
Xin Juan, Kaixiong Zhou, Ninghao Liu, Tianlong Chen, Xin Wang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 308-318
The premise for the great advancement of molecular machine learning is dependent on a considerable amount of labeled data. In many real-world scenarios the labeled molecules are limited in quantity or laborious to derive. Recent pseudo-labeling methods are usually designed based on a single domain knowledge thereby failing to understand the comprehensive molecular configurations and limiting their adaptability to generalize across diverse biochemical context. To this end we introduce an innovative paradigm for dealing with the molecule pseudo-labeling named as Molecular Data Programming (MDP). In particular we adopt systematic supervision sources via crafting multiple graph labeling functions which covers various molecular structural knowledge of graph kernels molecular fingerprints and topological features. Each of them creates an uncertain and biased labels for the unlabeled molecules. To address the decision conflicts among the diverse pseudo-labels we design a label synchronizer to differentiably model confidences and correlations between the labeling functions which yields probabilistic molecular labels to adapt for specific applications. These probabilistic molecular labels are used to train a molecular classifier for improving its generalization capability. On eight benchmark datasets we empirically demonstrate the effectiveness of MDP on the weakly supervised molecule classification tasks.

RadSimReal: Bridging the Gap Between Synthetic and Real Data in Radar Object Detection With Simulation
Oded Bialer, Yuval Haitman; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 15407-15416
Object detection in radar imagery with neural networks shows great potential for

improving autonomous driving. However obtaining annotated datasets from real radar images crucial for training these networks is challenging especially in scenarios with long-range detection and adverse weather and lighting conditions where radar performance excels. To address this challenge we present RadSimReal an innovative physical radar simulation capable of generating synthetic radar images with accompanying annotations for various radar types and environmental conditions all without the need for real data collection. Remarkably our findings demonstrate that training object detection models on RadSimReal data and subsequently evaluating them on real-world data produce performance levels comparable to models trained and tested on real data from the same dataset and even achieves better performance when testing across different real datasets. RadSimReal offers advantages over other physical radar simulations that it does not necessitate knowledge of the radar design details which are often not disclosed by radar suppliers and has faster run-time. This innovative tool has the potential to advance the development of computer vision algorithms for radar-based autonomous driving applications.
****
No More Ambiguity in 360deg Room Layout via Bi-Layout Estimation
Yu-Ju Tsai, Jin-Cheng Jhang, Jingjing Zheng, Wei Wang, Albert Y. C. Chen, Min Sun, Cheng-Hao Kuo, Ming-Hsuan Yang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 28056-28065
Inherent ambiguity in layout annotations poses significant challenges to developing accurate 360deg room layout estimation models. To address this issue we propose a novel Bi-Layout model capable of predicting two distinct layout types. One stops at ambiguous regions while the other extends to encompass all visible areas. Our model employs two global context embeddings where each embedding is designed to capture specific contextual information for each layout type. With our novel feature guidance module the image feature retrieves relevant context from these embeddings generating layout-aware features for precise bi-layout predictions. A unique property of our Bi-Layout model is its ability to inherently detect ambiguous regions by comparing the two predictions. To circumvent the need for manual correction of ambiguous annotations during testing we also introduce a new metric for disambiguating ground truth layouts. Our method demonstrates superior performance on benchmark datasets notably outperforming leading approaches. Specifically on the MatterportLayout dataset it improves 3DIoU from 81.70% to 82.57% across the full test set and notably from 54.80% to 59.97% in subsets with significant ambiguity.
****
Residual Denoising Diffusion Models
Jiawei Liu, Qiang Wang, Huijie Fan, Yinong Wang, Yandong Tang, Liangqiong Qu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 2773-2783
We propose residual denoising diffusion models (RDDM) a novel dual diffusion process that decouples the traditional single denoising diffusion process into residual diffusion and noise diffusion. This dual diffusion framework expands the denoising-based diffusion models initially uninterpretable for image restoration into a unified and interpretable model for both image generation and restoration by introducing residuals. Specifically our residual diffusion represents directional diffusion from the target image to the degraded input image and explicitly guides the reverse generation process for image restoration while noise diffusion represents random perturbations in the diffusion process. The residual prioritizes certainty while the noise emphasizes diversity enabling RDDM to effectively unify tasks with varying certainty or diversity requirements such as image generation and restoration. We demonstrate that our sampling process is consistent with that of DDPM and DDIM through coefficient transformation and propose a partially path-independent generation process to better understand the reverse process. Notably our RDDM enables a generic UNet trained with only an L1 loss and a batch size of 1 to compete with state-of-the-art image restoration methods. We provide code and pre-trained models to encourage further exploration application and development of our innovative framework (https://github.com/nachifur/RDDM).

Towards Accurate and Robust Architectures via Neural Architecture Search
Yuwei Ou, Yuqi Feng, Yanan Sun; Proceedings of the IEEE/CVF Conference on Comput
er Vision and Pattern Recognition (CVPR), 2024, pp. 5967-5976
To defend deep neural networks from adversarial attacks adversarial training has
 been drawing increasing attention for its effectiveness. However the accuracy a
nd robustness resulting from the adversarial training are limited by the archite
cture because adversarial training improves accuracy and robustness by adjusting
 the weight connection affiliated to the architecture. In this work we propose A
RNAS to search for accurate and robust architectures for adversarial training. F
irst we design an accurate and robust search space in which the placement of the
 cells and the proportional relationship of the filter numbers are carefully det
ermined. With the design the architectures can obtain both accuracy and robustne
ss by deploying accurate and robust structures to their sensitive positions resp
ectively. Then we propose a differentiable multi-objective search strategy perfo
rming gradient descent towards directions that are beneficial for both natural l
oss and adversarial loss thus the accuracy and robustness can be guaranteed at t
he same time. We conduct comprehensive experiments in terms of white-box attacks
 black-box attacks and transferability. Experimental results show that the searc
hed architecture has the strongest robustness with the competitive accuracy and
breaks the traditional idea that NAS-based architectures cannot transfer well to
 complex tasks in robustness scenarios. By analyzing outstanding architectures s
earched we also conclude that accurate and robust neural architectures tend to d
eploy different structures near the input and output which has great practical s
ignificance on both hand-crafting and automatically designing of accurate and ro
bust architectures.

Closely Interactive Human Reconstruction with Proxemics and Physics-Guided Adapt
ion
Buzhen Huang, Chen Li, Chongyang Xu, Liang Pan, Yangang Wang, Gim Hee Lee; Proce
edings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CV
PR), 2024, pp. 1011-1021
Existing multi-person human reconstruction approaches mainly focus on recovering
 accurate poses or avoiding penetration but overlook the modeling of close inter
actions. In this work we tackle the task of reconstructing closely interactive h
umans from a monocular video. The main challenge of this task comes from insuffi
cient visual information caused by depth ambiguity and severe inter-person occlu
sion. In view of this we propose to leverage knowledge from proxemic behavior an
d physics to compensate the lack of visual information. This is based on the obs
ervation that human interaction has specific patterns following the social proxe
mics. Specifically we first design a latent representation based on Vector Quant
ised-Variational AutoEncoder (VQ-VAE) to model human interaction. A proxemics an
d physics guided diffusion model is then introduced to denoise the initial distr
ibution. We design the diffusion model as dual branch with each branch represent
ing one individual such that the interaction can be modeled via cross attention.
 With the learned priors of VQ-VAE and physical constraint as the additional inf
ormation our proposed approach is capable of estimating accurate poses that are
also proxemics and physics plausible. Experimental results on Hi4D 3DPW and CHI3
D demonstrate that our method outperforms existing approaches. The code is avail
able at https://github.com/boycehbz/HumanInteraction.

A Noisy Elephant in the Room: Is Your Out-of-Distribution Detector Robust to Lab
el Noise?
Galadrielle Humblot-Renaux, Sergio Escalera, Thomas B. Moeslund; Proceedings of
the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024,
 pp. 22626-22636
The ability to detect unfamiliar or unexpected images is essential for safe depl
oyment of computer vision systems. In the context of classification the task of
detecting images outside of a model's training domain is known as out-of-distrib
ution (OOD) detection. While there has been a growing research interest in devel

oping post-hoc OOD detection methods there has been comparably little discussion around how these methods perform when the underlying classifier is not trained on a clean carefully curated dataset. In this work we take a closer look at 20 state-of-the-art OOD detection methods in the (more realistic) scenario where the labels used to train the underlying classifier are unreliable (e.g. crowd-sourced or web-scraped labels). Extensive experiments across different datasets noise types & levels architectures and checkpointing strategies provide insights into the effect of class label noise on OOD detection and show that poor separation between incorrectly classified ID samples vs. OOD samples is an overlooked yet important limitation of existing methods. Code: https://github.com/glhr/ood-labelnoise

VideoMAC: Video Masked Autoencoders Meet ConvNets
Gensheng Pei, Tao Chen, Xiruo Jiang, Huafeng Liu, Zeren Sun, Yazhou Yao; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 22733-22743
Recently the advancement of self-supervised learning techniques like masked autoencoders (MAE) has greatly influenced visual representation learning for images and videos. Nevertheless it is worth noting that the predominant approaches in existing masked image / video modeling rely excessively on resource-intensive vision transformers (ViTs) as the feature encoder. In this paper we propose a new approach termed as VideoMAC which combines video masked autoencoders with resource-friendly ConvNets. Specifically VideoMAC employs symmetric masking on randomly sampled pairs of video frames. To prevent the issue of mask pattern dissipation we utilize ConvNets which are implemented with sparse convolutional operators as encoders. Simultaneously we present a simple yet effective masked video modeling (MVM) approach a dual encoder architecture comprising an online encoder and an exponential moving average target encoder aimed to facilitate inter-frame reconstruction consistency in videos. Additionally we demonstrate that VideoMAC empowering classical (ResNet) / modern (ConvNeXt) convolutional encoders to harness the benefits of MVM outperforms ViT-based approaches on downstream tasks including video object segmentation (+5.2% / 6.4% \mathcal J &\mathcal F) body part propagation (+6.3% / 3.1% mIoU) and human pose tracking (+10.2% / 11.1% PCK@0.1).

Taming Stable Diffusion for Text to 360 Panorama Image Generation
Cheng Zhang, Qianyi Wu, Camilo Cruz Gambardella, Xiaoshui Huang, Dinh Phung, Wanli Ouyang, Jianfei Cai; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 6347-6357
Generative models e.g. Stable Diffusion have enabled the creation of photorealistic images from text prompts. Yet the generation of 360-degree panorama images from text remains a challenge particularly due to the dearth of paired text-panorama data and the domain gap between panorama and perspective images. In this paper we introduce a novel dual-branch diffusion model named PanFusion to generate a 360-degree image from a text prompt. We leverage the stable diffusion model as one branch to provide prior knowledge in natural image generation and register it to another panorama branch for holistic image generation. We propose a unique cross-attention mechanism with projection awareness to minimize distortion during the collaborative denoising process. Our experiments validate that PanFusion surpasses existing methods and thanks to its dual-branch structure can integrate additional constraints like room layout for customized panorama outputs.
****
3DSFLabelling: Boosting 3D Scene Flow Estimation by Pseudo Auto-labelling
Chaokang Jiang, Guangming Wang, Jiuming Liu, Hesheng Wang, Zhuang Ma, Zhenqiang Liu, Zhujin Liang, Yi Shan, Dalong Du; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 15173-15183
Learning 3D scene flow from LiDAR point clouds presents significant difficulties including poor generalization from synthetic datasets to real scenes scarcity of real-world 3D labels and poor performance on real sparse LiDAR point clouds. We present a novel approach from the perspective of auto-labelling aiming to generate a large number of 3D scene flow pseudo labels for real-world LiDAR point cl

ouds. Specifically we employ the assumption of rigid body motion to simulate potential object-level rigid movements in autonomous driving scenarios. By updating different motion attributes for multiple anchor boxes the rigid motion decomposition is obtained for the whole scene. Furthermore we developed a novel 3D scene flow data augmentation method for global and local motion. By perfectly synthesizing target point clouds based on augmented motion parameters we easily obtain lots of 3D scene flow labels in point clouds highly consistent with real scenarios. On multiple real-world datasets including LiDAR KITTI nuScenes and Argoverse our method outperforms all previous supervised and unsupervised methods without requiring manual labelling. Impressively our method achieves a tenfold reduction in EPE3D metric on the LiDAR KITTI dataset reducing it from 0.190m to a mere 0.008m error.

Unsigned Orthogonal Distance Fields: An Accurate Neural Implicit Representation for Diverse 3D Shapes
Yujie Lu, Long Wan, Nayu Ding, Yulong Wang, Shuhan Shen, Shen Cai, Lin Gao; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 20551-20560
Neural implicit representation of geometric shapes has witnessed considerable advancements in recent years. However common distance field based implicit representations specifically signed distance field (SDF) for watertight shapes or unsigned distance field (UDF) for arbitrary shapes routinely suffer from degradation of reconstruction accuracy when converting to explicit surface points and meshes. In this paper we introduce a novel neural implicit representation based on unsigned orthogonal distance fields (UODFs). In UODFs the minimal unsigned distance from any spatial point to the shape surface is defined solely in one orthogonal direction contrasting with the multi-directional determination made by SDF and UDF. Consequently every point in the 3D UODFs can directly access its closest surface points along three orthogonal directions. This distinctive feature leverages the accurate reconstruction of surface points without interpolation errors. We verify the effectiveness of UODFs through a range of reconstruction examples extending from simple watertight or non-watertight shapes to complex shapes that include hollows internal or assembling structures.

Modular Blind Video Quality Assessment
Wen Wen, Mu Li, Yabin Zhang, Yiting Liao, Junlin Li, Li Zhang, Kede Ma; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 2763-2772
Blind video quality assessment (BVQA) plays a pivotal role in evaluating and improving the viewing experience of end-users across a wide range of video-based platforms and services. Contemporary deep learning-based models primarily analyze video content in its aggressively subsampled format while being blind to the impact of the actual spatial resolution and frame rate on video quality. In this paper we propose a modular BVQA model and a method of training it to improve its modularity. Our model comprises a base quality predictor a spatial rectifier and a temporal rectifier responding to the visual content and distortion spatial resolution and frame rate changes on video quality respectively. During training spatial and temporal rectifiers are dropped out with some probabilities to render the base quality predictor a standalone BVQA model which should work better with the rectifiers. Extensive experiments on both professionally-generated content and user-generated content video databases show that our quality model achieves superior or comparable performance to current methods. Additionally the modularity of our model offers an opportunity to analyze existing video quality databases in terms of their spatial and temporal complexity.

Question Aware Vision Transformer for Multimodal Reasoning
Roy Ganz, Yair Kittenplon, Aviad Aberdam, Elad Ben Avraham, Oren Nuriel, Shai Mazor, Ron Litman; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 13861-13871
Vision-Language (VL) models have gained significant research focus enabling rema

rkable advances in multimodal reasoning. These architectures typically comprise a vision encoder a Large Language Model (LLM) and a projection module that aligns visual features with the LLM's representation space. Despite their success a critical limitation persists: the vision encoding process remains decoupled from user queries often in the form of image-related questions. Consequently the resulting visual features may not be optimally attuned to the query-specific elements of the image. To address this we introduce QA-ViT a Question Aware Vision Transformer approach for multimodal reasoning which embeds question awareness directly within the vision encoder. This integration results in dynamic visual features focusing on relevant image aspects to the posed question. QA-ViT is model-agnostic and can be incorporated efficiently into any VL architecture. Extensive experiments demonstrate the effectiveness of applying our method to various multimodal architectures leading to consistent improvement across diverse tasks and showcasing its potential for enhancing visual and scene-text understanding.

OST: Refining Text Knowledge with Optimal Spatio-Temporal Descriptor for General Video Recognition
Tongjia Chen, Hongshan Yu, Zhengeng Yang, Zechuan Li, Wei Sun, Chen Chen; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 18888-18898
Due to the resource-intensive nature of training vision-language models on expansive video data a majority of studies have centered on adapting pre-trained image-language models to the video domain. Dominant pipelines propose to tackle the visual discrepancies with additional temporal learners while overlooking the substantial discrepancy for web-scaled descriptive narratives and concise action category names leading to less distinct semantic space and potential performance limitations. In this work we prioritize the refinement of text knowledge to facilitate generalizable video recognition. To address the limitations of the less distinct semantic space of category names we prompt a large language model (LLM) to augment action class names into Spatio-Temporal Descriptors thus bridging the textual discrepancy and serving as a knowledge base for general recognition. Moreover to assign the best descriptors with different video instances we propose Optimal Descriptor Solver forming the video recognition problem as solving the optimal matching flow across frame-level representations and descriptors. Comprehensive evaluations in zero-shot few-shot and fully supervised video recognition highlight the effectiveness of our approach. Our best model achieves a state-of-the-art zero-shot accuracy of 75.1% on Kinetics-600.

Habitat Synthetic Scenes Dataset (HSSD-200): An Analysis of 3D Scene Scale and Realism Tradeoffs for ObjectGoal Navigation
Mukul Khanna, Yongsen Mao, Hanxiao Jiang, Sanjay Haresh, Brennan Shacklett, Dhruv Batra, Alexander Clegg, Eric Undersander, Angel X. Chang, Manolis Savva; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 16384-16393
We contribute the Habitat Synthetic Scene Dataset a dataset of 211 high-quality 3D scenes and use it to test navigation agent generalization to realistic 3D environments. Our dataset represents real interiors and contains a diverse set of 18656 models of real-world objects. We investigate the impact of synthetic 3D scene dataset scale and realism on the task of training embodied agents to find and navigate to objects (ObjectGoal navigation). By comparing to synthetic 3D scene datasets from prior work we find that scale helps in generalization but the benefits quickly saturate making visual fidelity and correlation to real-world scenes more important. Our experiments show that agents trained on our smaller-scale dataset can match or outperform agents trained on much larger datasets. Surprisingly we observe that agents trained on just 122 scenes from our dataset outperform agents trained on 10000 scenes from the ProcTHOR-10K dataset in terms of zero-shot generalization in real-world scanned environments.
****
OA-CNNs: Omni-Adaptive Sparse CNNs for 3D Semantic Segmentation
Bohao Peng, Xiaoyang Wu, Li Jiang, Yukang Chen, Hengshuang Zhao, Zhuotao Tian, J

iaya Jia; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 21305-21315
The booming of 3D recognition in the 2020s began with the introduction of point cloud transformers. They quickly overwhelmed sparse CNNs and became state-of-the-art models especially in 3D semantic segmentation. However sparse CNNs are still valuable networks due to their efficiency treasure and ease of application. In this work we reexamine the design distinctions and test the limits of what a sparse CNN can achieve. We discover that the key credit to the performance difference is adaptivity. Specifically we propose two key components i.e. adaptive receptive fields (spatially) and adaptive relation to bridge the gap. This exploration led to the creation of Omni-Adaptive 3D CNNs (OA-CNNs) a family of networks that integrates a lightweight module to greatly enhance the adaptivity of sparse CNNs at minimal computational cost. Without any self-attention modules OA-CNNs favorably surpass point transformers in terms of accuracy in both indoor and outdoor scenes with much less latency and memory cost. Notably it achieves 76.1% 78.9% and 70.6% mIoU on ScanNet v2 nuScenes and SemanticKITTI validation benchmarks respectively while maintaining at most 5x better speed than transformer counterparts. This revelation highlights the potential of pure sparse CNNs to outperform transformer-related networks. Our code is built upon Pointcept which is available at https://github.com/Pointcept/Pointcept.

RELI11D: A Comprehensive Multimodal Human Motion Dataset and Method
Ming Yan, Yan Zhang, Shuqiang Cai, Shuqi Fan, Xincheng Lin, Yudi Dai, Siqi Shen, Chenglu Wen, Lan Xu, Yuexin Ma, Cheng Wang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 2250-2262
Comprehensive capturing of human motions requires both accurate captures of complex poses and precise localization of the human within scenes. Most of the HPE datasets and methods primarily rely on RGB LiDAR or IMU data. However solely using these modalities or a combination of them may not be adequate for HPE particularly for complex and fast movements. For holistic human motion understanding we present RELI11D a high-quality multimodal human motion dataset involves LiDAR IMU system RGB camera and Event camera. It records the motions of 10 actors performing 5 sports in 7 scenes including 3.32 hours of synchronized LiDAR point clouds IMU measurement data RGB videos and Event steams. Through extensive experiments we demonstrate that the RELI11D presents considerable challenges and opportunities as it contains many rapid and complex motions that require precise location. To address the challenge of integrating different modalities we propose LEIR a multimodal baseline that effectively utilizes LiDAR Point Cloud Event stream and RGB through our cross-attention fusion strategy. We show that LEIR exhibits promising results for rapid motions and daily motions and that utilizing the characteristics of multiple modalities can indeed improve HPE performance. Both the dataset and source code will be released publicly to the research community fostering collaboration and enabling further exploration in this field.

Generative Image Dynamics
Zhengqi Li, Richard Tucker, Noah Snavely, Aleksander Holynski; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 24142-24153
We present an approach to modeling an image-space prior on scene motion. Our prior is learned from a collection of motion trajectories extracted from real video sequences depicting natural oscillatory dynamics of objects such as treesflowers candles and clothes swaying in the wind. We model dense long-term motion in the Fourier domain as spectral volumes which we find are well-suited to prediction with diffusion models. Given a single image our trained model uses a frequency-coordinated diffusion sampling process to predict a spectral volume which can be converted into a motion texture that spans an entire video. Along with an image-based rendering module the predicted motion representation can be used for a number of downstream applications such as turning still images into seamlessly looping videos or allowing users to interact with objects in real images producing realistic simulated dynamics (by interpreting the spectral volumes as image-spac

e modal bases). See our project page for more results: generative-dynamics.githu

One-Class Face Anti-spoofing via Spoof Cue Map-Guided Feature Learning
Pei-Kai Huang, Cheng-Hsuan Chiang, Tzu-Hsien Chen, Jun-Xiong Chong, Tyng-Luh Liu
, Chiou-Ting Hsu; Proceedings of the IEEE/CVF Conference on Computer Vision and
Pattern Recognition (CVPR), 2024, pp. 277-286
Many face anti-spoofing (FAS) methods have focused on learning discriminative fe
atures from both live and spoof training data to strengthen the security of face
 recognition systems. However since not every possible attack type is available
in the training stage these FAS methods usually fail to detect unseen attacks in
 the inference stage. In comparison one-class FAS where the training data are fr
om only live faces aims to detect whether a test face image belongs to the live
class or not. In this paper we propose a novel One-Class Spoof Cue Map estimatio
n Network (OC-SCMNet) to address the one-class FAS detection problem. Our first
goal is to learn to extract latent spoof features from live images so that their
 estimated Spoof Cue Maps (SCMs) should have zero responses. To avoid trapping t
o a trivial solution we devise a novel SCM-guided feature learning by combining
many SCMs as pseudo ground-truths to guide a conditional generator to generate l
atent spoof features for spoof data. Our second goal is to approximately simulat
e the potential out-of-distribution spoof attacks. To this end we propose using
a memory bank to dynamically preserve a set of sufficiently "independent" latent
 spoof features to encourage the generator to probe the latent spoof feature spa
ce. Extensive experiments conducted on eight FAS benchmark datasets demonstrate
that the proposed OC-SCMNet not only outperforms previous one-class FAS methods
but also achieves comparable performances to state-of-the-art two-class FAS meth
od. The codes are available at https://github.com/Pei-KaiHuang/CVPR24_OC_SCMNet.

On the Test-Time Zero-Shot Generalization of Vision-Language Models: Do We Reall
y Need Prompt Learning?
Maxime Zanella, Ismail Ben Ayed; Proceedings of the IEEE/CVF Conference on Compu
ter Vision and Pattern Recognition (CVPR), 2024, pp. 23783-23793
The development of large vision-language models notably CLIP has catalyzed resea
rch into effective adaptation techniques with a particular focus on soft prompt
tuning. Conjointly test-time augmentation which utilizes multiple augmented view
s of a single image to enhance zero-shot generalization is emerging as a signifi
cant area of interest. This has predominantly directed research efforts towards
test-time prompt tuning. In contrast we introduce a robust MeanShift for Test-ti
me Augmentation (MTA) which surpasses prompt-based methods without requiring thi
s intensive training procedure. This positions MTA as an ideal solution for both
 standalone and API-based applications. Additionally our method does not rely on
 ad hoc rules (e.g. confidence threshold) used in some previous test-time augmen
tation techniques to filter the augmented views. Instead MTA incorporates a qual
ity assessment variable for each view directly into its optimization process ter
med as the inlierness score. This score is jointly optimized with a density mode
 seeking process leading to an efficient training- and hyperparameter-free appro
ach. We extensively benchmark our method on 15 datasets and demonstrate MTA's su
periority and computational efficiency. Deployed easily as plug-and-play module
on top of zero-shot models and state-of-the-art few-shot methods MTA shows syste
matic and consistent improvements.

InteractDiffusion: Interaction Control in Text-to-Image Diffusion Models
Jiun Tian Hoe, Xudong Jiang, Chee Seng Chan, Yap-Peng Tan, Weipeng Hu; Proceedin
gs of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR),
 2024, pp. 6180-6189
Large-scale text-to-image (T2I) diffusion models have showcased incredible capab
ilities in generating coherent images based on textual descriptions enabling vas
t applications in content generation. While recent advancements have introduced
control over factors such as object localization posture and image contours a cr
ucial gap remains in our ability to control the interactions between objects in

the generated content. Well-controlling interactions in generated images could y
ield meaningful applications such as creating realistic scenes with interacting
characters. In this work we study the problems of conditioning T2I diffusion mod
els with Human-Object Interaction (HOI) information consisting of a triplet labe
l (person action object) and corresponding bounding boxes. We propose a pluggabl
e interaction control model called InteractDiffusion that extends existing pre-t
rained T2I diffusion models to enable them being better conditioned on interacti
ons. Specifically we tokenize the HOI information and learn their relationships
via interaction embeddings. A conditioning self-attention layer is trained to ma
p HOI tokens to visual tokens thereby conditioning the visual tokens better in e
xisting T2I diffusion models. Our model attains the ability to control the inter
action and location on existing T2I diffusion models which outperforms existing
baselines by a large margin in HOI detection score as well as fidelity in FID an
d KID. Project page: https://jiuntian.github.io/interactdiffusion.

NViST: In the Wild New View Synthesis from a Single Image with Transformers
Wonbong Jang, Lourdes Agapito; Proceedings of the IEEE/CVF Conference on Compute
r Vision and Pattern Recognition (CVPR), 2024, pp. 10181-10193
We propose NViST a transformer-based model for efficient and generalizable novel
-view synthesis from a single image for real-world scenes. In contrast to many m
ethods that are trained on synthetic data object-centred scenarios or in a categ
ory-specific manner NViST is trained on MVImgNet a large-scale dataset of casual
ly-captured real-world videos of hundreds of object categories with diverse back
grounds. NViST transforms image inputs directly into a radiance field conditione
d on camera parameters via adaptive layer normalisation. In practice NViST explo
its fine-tuned masked autoencoder (MAE) features and translates them to 3D outpu
t tokens via cross-attention while addressing occlusions with self-attention. To
 move away from object-centred datasets and enable full scene synthesis NViST ad
opts a 6-DOF camera pose model and only requires relative pose dropping the need
 for canonicalization of the training data which removes a substantial barrier t
o it being used on casually captured datasets. We show results on unseen objects
 and categories from MVImgNet and even generalization to casual phone captures.
We conduct qualitative and quantitative evaluations on MVImgNet and ShapeNet to
show that our model represents a step forward towards enabling true in-the-wild
generalizable novel-view synthesis from a single image. Project webpage: https:/
/wbjang.github.io/nvist_webpage.

Beyond Text: Frozen Large Language Models in Visual Signal Comprehension
Lei Zhu, Fangyun Wei, Yanye Lu; Proceedings of the IEEE/CVF Conference on Comput
er Vision and Pattern Recognition (CVPR), 2024, pp. 27047-27057
In this work we investigate the potential of a large language model (LLM) to dir
ectly comprehend visual signals without the necessity of fine-tuning on multi-mo
dal datasets. The foundational concept of our method views an image as a linguis
tic entity and translates it to a set of discrete words derived from the LLM's v
ocabulary. To achieve this we present the Vision-to-Language Tokenizer abbreviat
ed as V2T Tokenizer which transforms an image into a "foreign language" with the
 combined aid of an encoder-decoder the LLM vocabulary and a CLIP model. With th
is innovative image encoding the LLM gains the ability not only for visual compr
ehension but also for image denoising and restoration in an auto-regressive fash
ion--crucially without any fine-tuning. We undertake rigorous experiments to val
idate our method encompassing understanding tasks like image recognition image c
aptioning and visual question answering as well as image denoising tasks like in
painting outpainting deblurring and shift restoration. Code and models are avail
able at https://github.com/zh460045050/V2L-Tokenizer.

Rotated Multi-Scale Interaction Network for Referring Remote Sensing Image Segme
ntation
Sihan Liu, Yiwei Ma, Xiaoqing Zhang, Haowei Wang, Jiayi Ji, Xiaoshuai Sun, Rongr
ong Ji; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Re
cognition (CVPR), 2024, pp. 26658-26668

Referring Remote Sensing Image Segmentation (RRSIS) is a new challenge that comb
ines computer vision and natural language processing. Traditional Referring Imag
e Segmentation (RIS) approaches have been impeded by the complex spatial scales
and orientations found in aerial imagery leading to suboptimal segmentation resu
lts. To address these challenges we introduce the Rotated Multi-Scale Interactio
n Network (RMSIN) an innovative approach designed for the unique demands of RRSI
S. RMSIN incorporates an Intra-scale Interaction Module (IIM) to effectively add
ress the fine-grained detail required at multiple scales and a Cross-scale Inter
action Module (CIM) for integrating these details coherently across the network.
 Furthermore RMSIN employs an Adaptive Rotated Convolution (ARC) to account for
the diverse orientations of objects a novel contribution that significantly enha
nces segmentation accuracy. To assess the efficacy of RMSIN we have curated an e
xpansive dataset comprising 17402 image-caption-mask triplets which is unparalle
led in terms of scale and variety. This dataset not only presents the model with
 a wide range of spatial and rotational scenarios but also establishes a stringe
nt benchmark for the RRSIS task ensuring a rigorous evaluation of performance. E
xperimental evaluations demonstrate the exceptional performance of RMSIN surpass
ing existing state-of-the-art models by a significant margin. Datasets and code
are available at https://github.com/Lsan2401/RMSIN.

GLACE: Global Local Accelerated Coordinate Encoding
Fangjinhua Wang, Xudong Jiang, Silvano Galliani, Christoph Vogel, Marc Pollefeys
; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognit
ion (CVPR), 2024, pp. 21562-21571
Scene coordinate regression (SCR) methods are a family of visual localization me
thods that directly regress 2D-3D matches for camera pose estimation. They are e
ffective in small-scale scenes but face significant challenges in large-scale sc
enes that are further amplified in the absence of ground truth 3D point clouds f
or supervision. Here the model can only rely on reprojection constraints and nee
ds to implicitly triangulate the points. The challenges stem from a fundamental
dilemma: The network has to be invariant to observations of the same landmark at
 different viewpoints and lighting conditions etc. but at the same time discrimi
nate unrelated but similar observations. The latter becomes more relevant and se
vere in larger scenes. In this work we tackle this problem by introducing the co
ncept of co-visibility to the network. We propose GLACE which integrates pre-tra
ined global and local encodings and enables SCR to scale to large scenes with on
ly a single small-sized network. Specifically we propose a novel feature diffusi
on technique that implicitly groups the reprojection constraints with co-visibil
ity and avoids overfitting to trivial solutions. Additionally our position decod
er parameterizes the output positions for large-scale scenes more effectively. W
ithout using 3D models or depth maps for supervision our method achieves state-o
f-the-art results on large-scale scenes with a low-map-size model. On Cambridge
landmarks with a single model we achieve a 17% lower median position error than
Poker the ensemble variant of the state-of-the-art SCR method ACE. Code is avail
able at: https://github.com/cvg/glace.

Emergent Open-Vocabulary Semantic Segmentation from Off-the-shelf Vision-Languag
e Models
Jiayun Luo, Siddhesh Khandelwal, Leonid Sigal, Boyang Li; Proceedings of the IEE
E/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 40
29-4040
From image-text pairs large-scale vision-language models (VLMs) learn to implici
tly associate image regions with words which prove effective for tasks like visu
al question answering. However leveraging the learned association for open-vocab
ulary semantic segmentation remains a challenge. In this paper we propose a simp
le yet extremely effective training-free technique Plug-and-Play Open-Vocabulary
 Semantic Segmentation (PnP-OVSS) for this task. PnP-OVSS leverages a VLM with d
irect text-to-image cross-attention and an image-text matching loss. To balance
between over-segmentation and under-segmentation we introduce Salience Dropout;
by iteratively dropping patches that the model is most attentive to we are able

to better resolve the entire extent of the segmentation mask. PnP-OVSS does not require any neural network training and performs hyperparameter tuning without the need for any segmentation annotations even for a validation set. PnP-OVSS demonstrates substantial improvements over comparable baselines (+29.4% mIoU on Pascal VOC +13.2% mIoU on Pascal Context +14.0% mIoU on MS COCO +2.4% mIoU on COCO Stuff) and even outperforms most baselines that conduct additional network training on top of pretrained VLMs. Our codebase is at https://github.com/letitiabanana/PnP-OVSS.

Localization Is All You Evaluate: Data Leakage in Online Mapping Datasets and How to Fix It
Adam Lilja, Junsheng Fu, Erik Stenborg, Lars Hammarstrand; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 22150-22159
The task of online mapping is to predict a local map using current sensor observations e.g. from lidar and camera without relying on a pre-built map. State-of-the-art methods are based on supervised learning and are trained predominantly using two datasets: nuScenes and Argoverse 2. However these datasets revisit the same geographic locations across training validation and test sets. Specifically over 80% of nuScenes and 40% of Argoverse 2 validation and test samples are less than 5 m from a training sample. At test time the methods are thus evaluated more on how well they localize within a memorized implicit map built from the training data than on extrapolating to unseen locations. Naturally this data leakage causes inflated performance numbers and we propose geographically disjoint data splits to reveal the true performance in unseen environments. Experimental results show that methods perform considerably worse some dropping more than 45 mAP when trained and evaluated on proper data splits. Additionally a reassessment of prior design choices reveals diverging conclusions from those based on the original split. Notably the impact of lifting methods and the support from auxiliary tasks (e.g. depth supervision) on performance appears less substantial or follows a different trajectory than previously perceived.

Alchemist: Parametric Control of Material Properties with Diffusion Models
Prafull Sharma, Varun Jampani, Yuanzhen Li, Xuhui Jia, Dmitry Lagun, Fredo Durand, Bill Freeman, Mark Matthews; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 24130-24141
We propose a method to control material attributes of objects like roughness metallic albedo and transparency in real images. Our method capitalizes on the generative prior of text-to-image models known for photorealism employing a scalar value and instructions to alter low-level material properties. Addressing the lack of datasets with controlled material attributes we generated an object-centric synthetic dataset with physically-based materials. Fine-tuning a modified pre-trained text-to-image model on this synthetic dataset enables us to edit material properties in real-world images while preserving all other attributes. We show the potential application of our model to material edited NeRFs.
****
Step Differences in Instructional Video
Tushar Nagarajan, Lorenzo Torresani; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 18740-18750
Comparing a user video to a reference how-to video is a key requirement for AR/VR technology delivering personalized assistance tailored to the user's progress. However current approaches for language-based assistance can only answer questions about a single video. We propose an approach that first automatically generates large amounts of visual instruction tuning data involving pairs of videos from HowTo100M by leveraging existing step annotations and accompanying narrations and then trains a video-conditioned language model to jointly reason across multiple raw videos. Our model achieves state-of-the-art performance at identifying differences between video pairs and ranking videos based on the severity of these differences and shows promising ability to perform general reasoning over multiple videos.

Depth Anything: Unleashing the Power of Large-Scale Unlabeled Data
Lihe Yang, Bingyi Kang, Zilong Huang, Xiaogang Xu, Jiashi Feng, Hengshuang Zhao; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recogniti
on (CVPR), 2024, pp. 10371-10381
This work presents Depth Anything a highly practical solution for robust monocul
ar depth estimation. Without pursuing novel technical modules we aim to build a
simple yet powerful foundation model dealing with any images under any circumsta
nces. To this end we scale up the dataset by designing a data engine to collect
and automatically annotate large-scale unlabeled data (62M) which significantly
 enlarges the data coverage and thus is able to reduce the generalization error.
 We investigate two simple yet effective strategies that make data scaling-up pr
omising. First a more challenging optimization target is created by leveraging d
ata augmentation tools. It compels the model to actively seek extra visual knowl
edge and acquire robust representations. Second an auxiliary supervision is deve
loped to enforce the model to inherit rich semantic priors from pre-trained enco
ders. We evaluate its zero-shot capabilities extensively including six public da
tasets and randomly captured photos. It demonstrates impressive generalization a
bility. Further through fine-tuning it with metric depth information from NYUv2
and KITTI new SOTAs are set. Our better depth model also results in a better dep
th-conditioned ControlNet. Our models are released at https://github.com/LiheYou
ng/Depth-Anything.

SelfPose3d: Self-Supervised Multi-Person Multi-View 3d Pose Estimation
Vinkle Srivastav, Keqi Chen, Nicolas Padoy; Proceedings of the IEEE/CVF Conferen
ce on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 2502-2512
We present a new self-supervised approach SelfPose3d for estimating 3d poses of
multiple persons from multiple camera views. Unlike current state-of-the-art ful
ly-supervised methods our approach does not require any 2d or 3d ground-truth po
ses and uses only the multi-view input images from a calibrated camera setup and
 2d pseudo poses generated from an off-the-shelf 2d human pose estimator. We pro
pose two self-supervised learning objectives: self-supervised person localizatio
n in 3d space and self-supervised 3d pose estimation. We achieve self-supervised
 3d person localization by training the model on synthetically generated 3d poin
ts serving as 3d person root positions and on the projected root-heatmaps in all
 the views. We then model the 3d poses of all the localized persons with a bottl
eneck representation map them onto all views obtaining 2d joints and render them
 using 2d Gaussian heatmaps in an end-to-end differentiable manner. Afterwards w
e use the corresponding 2d joints and heatmaps from the pseudo 2d poses for lear
ning. To alleviate the intrinsic inaccuracy of the pseudo labels we propose an a
daptive supervision attention mechanism to guide the self-supervision. Our exper
iments and analysis on three public benchmark datasets including Panoptic Shelf
and Campus show the effectiveness of our approach which is comparable to fully-s
upervised methods. Code is available at https://github.com/CAMMA-public/SelfPose
3D.

MoDE: CLIP Data Experts via Clustering
Jiawei Ma, Po-Yao Huang, Saining Xie, Shang-Wen Li, Luke Zettlemoyer, Shih-Fu Ch
ang, Wen-Tau Yih, Hu Xu; Proceedings of the IEEE/CVF Conference on Computer Visi
on and Pattern Recognition (CVPR), 2024, pp. 26354-26363
The success of contrastive language-image pretraining (CLIP) relies on the super
vision from the pairing between images and captions which tends to be noisy in w
eb-crawled data. We present Mixture of Data Experts (MoDE) and learn a system of
 CLIP data experts via clustering. Each data expert is trained on one data clust
er being less sensitive to false negative noises in other clusters. At inference
 time we ensemble their outputs by applying weights determined through the corre
lation between task metadata and cluster conditions. To estimate the correlation
 precisely the samples in one cluster should be semantically similar but the num
ber of data experts should still be reasonable for training and inference. As su
ch we consider the ontology in human language and propose to use fine-grained cl

uster centers to represent each data expert at a coarse-grained level. Experimen
tal studies show that four CLIP data experts on ViT-B/16 outperform the ViT-L/14
 by OpenAI CLIP and OpenCLIP on zero-shot image classification but with less (<3
5%) training cost. Meanwhile MoDE can train all data expert asynchronously and c
an flexibly include new data experts. The code is available here.

Joint2Human: High-Quality 3D Human Generation via Compact Spherical Embedding of
 3D Joints
Muxin Zhang, Qiao Feng, Zhuo Su, Chao Wen, Zhou Xue, Kun Li; Proceedings of the
IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp.
 1429-1438
3D human generation is increasingly significant in various applications. However
 the direct use of 2D generative methods in 3D generation often results in losin
g local details while methods that reconstruct geometry from generated images st
ruggle with global view consistency. In this work we introduce Joint2Human a nov
el method that leverages 2D diffusion models to generate detailed 3D human geome
try directly ensuring both global structure and local details. To achieve this w
e employ the Fourier occupancy field (FOF) representation enabling the direct ge
neration of 3D shapes as preliminary results with 2D generative models. With the
 proposed high-frequency enhancer and the multi-view recarving strategy our meth
od can seamlessly integrate the details from different views into a uniform glob
al shape. To better utilize the 3D human prior and enhance control over the gene
rated geometry we introduce a compact spherical embedding of 3D joints. This all
ows for an effective guidance of pose during the generation process. Additionall
y our method can generate 3D humans guided by textual inputs. Our experimental r
esults demonstrate the capability of our method to ensure global structure local
 details high resolution and low computational cost simultaneously. More results

Prompt-Free Diffusion: Taking "Text" out of Text-to-Image Diffusion Models
Xingqian Xu, Jiayi Guo, Zhangyang Wang, Gao Huang, Irfan Essa, Humphrey Shi; Pro
ceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (
CVPR), 2024, pp. 8682-8692
Text-to-image (T2I) research has grown explosively in the past year owing to the
 large-scale pre-trained diffusion models and many emerging personalization and
editing approaches. Yet one pain point persists: the text prompt engineering and
 searching high-quality text prompts for customized results is more art than sci
ence. Moreover as commonly argued: "an image is worth a thousand words" - the at
tempt to describe a desired image with texts often ends up being ambiguous and c
annot comprehensively cover delicate visual details hence necessitating more add
itional controls from the visual domain. In this paper we take a bold step forwa
rd: taking "Text" out of a pretrained T2I diffusion model to reduce the burdenso
me prompt engineering efforts for users. Our proposed framework Prompt-Free Diff
usion relies on only visual inputs to generate new images: it takes a reference
image as "context" an optional image structural conditioning and an initial nois
e with absolutely no text prompt. The core architecture behind the scene is Sema
ntic Context Encoder (SeeCoder) substituting the commonly used CLIP-based or LLM
-based text encoder. The reusability of SeeCoder also makes it a convenient drop
-in component: one can also pre-train a SeeCoder in one T2I model and reuse it f
or another. Through extensive experiments Prompt-Free Diffusion is experimentall
y found to (i) outperform prior exemplar-based image synthesis approaches; (ii)
perform on par with state-of-the-art T2I models using prompts following the best
 practice; and (iii) be naturally extensible to other downstream applications su
ch as anime figure generation and virtual try-on with promising quality. Our cod
e and models will be open-sourced.

MPOD123: One Image to 3D Content Generation Using Mask-enhanced Progressive Outl
ine-to-Detail Optimization
Jimin Xu, Tianbao Wang, Tao Jin, Shengyu Zhang, Dongjie Fu, Zhe Wang, Jiangjing

Lyu, Chengfei Lv, Chaoyue Niu, Zhou Yu, Zhou Zhao, Fei Wu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 10682-10692
Recent advancements in single image driven 3D content generation have been propelled by leveraging prior knowledge from pretrained 2D diffusion models. However the 3D content generated by existing methods often exhibits distorted outline shapes and inadequate details. To solve this problem we propose a novel framework called Mask-enhanced Progressive Outline-to-Detail optimization (aka. MPOD123) which consists of two stages. Specifically in the first stage MPOD123 utilizes the pretrained view-conditioned diffusion model to guide the outline shape optimization of the 3D content. Given certain viewpoint we estimate outline shape priors in the form of 2D mask from the 3D content by leveraging opacity calculation. In the second stage MPOD123 incorporates Detail Appearance Inpainting (DAI) to guide the refinement on local geometry and texture with the shape priors. The essence of DAI lies in the Mask Rectified Cross-Attention (MRCA) which can be conveniently plugged in the stable diffusion model. The MRCA module utilizes the mask to rectify the attention map from each cross-attention layer. Accompanied with this new module DAI is capable of guiding the detail refinement of the 3D content while better preserves the outline shape. To assess the applicability in practical scenarios we contribute a new dataset modeled on real-world e-commerce environments. Extensive quantitative and qualitative experiments on this dataset and open benchmarks demonstrate the effectiveness of MPOD123 over the state-of-the-arts.
****
Multi-agent Long-term 3D Human Pose Forecasting via Interaction-aware Trajectory Conditioning
Jaewoo Jeong, Daehee Park, Kuk-Jin Yoon; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 1617-1628
Human pose forecasting garners attention for its diverse applications. However challenges in modeling the multi-modal nature of human motion and intricate interactions among agents persist particularly with longer timescales and more agents. In this paper we propose an interaction-aware trajectory-conditioned long-term multi-agent human pose forecasting model utilizing a coarse-to-fine prediction approach: multi-modal global trajectories are initially forecasted followed by respective local pose forecasts conditioned on each mode. In doing so our Trajectory2Pose model introduces a graph-based agent-wise interaction module for a reciprocal forecast of local motion-conditioned global trajectory and trajectory-conditioned local pose. Our model effectively handles the multi-modality of human motion and the complexity of long-term multi-agent interactions improving performance in complex environments. Furthermore we address the lack of long-term (6s+) multi-agent (5+) datasets by constructing a new dataset from real-world images and 2D annotations enabling a comprehensive evaluation of our proposed model. State-of-the-art prediction performance on both complex and simpler datasets confirms the generalized effectiveness of our method. The code is available at https://github.com/Jaewoo97/T2P.

UnionFormer: Unified-Learning Transformer with Multi-View Representation for Image Manipulation Detection and Localization
Shuaibo Li, Wei Ma, Jianwei Guo, Shibiao Xu, Benchong Li, Xiaopeng Zhang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 12523-12533
We present UnionFormer a novel framework that integrates tampering clues across three views by unified learning for image manipulation detection and localization. Specifically we construct a BSFI-Net to extract tampering features from RGB and noise views achieving enhanced responsiveness to boundary artifacts while modulating spatial consistency at different scales. Additionally to explore the inconsistency between objects as a new view of clues we combine object consistency modeling with tampering detection and localization into a three-task unified learning process allowing them to promote and improve mutually. Therefore we acquire a unified manipulation discriminative representation under multi-scale supervi

sion that consolidates information from three views. This integration facilitate
s highly effective concurrent detection and localization of tampering. We perfor
m extensive experiments on diverse datasets and the results show that the propos
ed approach outperforms state-of-the-art methods in tampering detection and loca
lization.

Situational Awareness Matters in 3D Vision Language Reasoning
Yunze Man, Liang-Yan Gui, Yu-Xiong Wang; Proceedings of the IEEE/CVF Conference
on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 13678-13688
Being able to carry out complicated vision language reasoning tasks in 3D space
represents a significant milestone in developing household robots and human-cent
ered embodied AI. In this work we demonstrate that a critical and distinct chall
enge in 3D vision language reasoning is the situational awareness which incorpor
ates two key components: (1) The autonomous agent grounds its self-location base
d on a language prompt. (2) The agent answers open-ended questions from the pers
pective of its calculated position. To address this challenge we introduce SIG3D
 an end-to-end Situation-Grounded model for 3D vision language reasoning. We tok
enize the 3D scene into sparse voxel representation and propose a language-groun
ded situation estimator followed by a situated question answering module. Experi
ments on the SQA3D and ScanQA datasets show that SIG3D outperforms state-of-the-
art models in situational estimation and question answering by a large margin (e
.g. an enhancement of over 30% on situation accuracy). Subsequent analysis corro
borates our architectural design choices explores the distinct functions of visu
al and textual tokens and highlights the importance of situational awareness in
the domain of 3D question-answering. Project page is available at https://yunzem
an.github.io/situation3d.

RCBEVDet: Radar-camera Fusion in Bird's Eye View for 3D Object Detection
Zhiwei Lin, Zhe Liu, Zhongyu Xia, Xinhao Wang, Yongtao Wang, Shengxiang Qi, Yang
 Dong, Nan Dong, Le Zhang, Ce Zhu; Proceedings of the IEEE/CVF Conference on Com
puter Vision and Pattern Recognition (CVPR), 2024, pp. 14928-14937
Three-dimensional object detection is one of the key tasks in autonomous driving
. To reduce costs in practice low-cost multi-view cameras for 3D object detectio
n are proposed to replace the expansive LiDAR sensors. However relying solely on
 cameras is difficult to achieve highly accurate and robust 3D object detection.
 An effective solution to this issue is combining multi-view cameras with the ec
onomical millimeter-wave radar sensor to achieve more reliable multi-modal 3D ob
ject detection. In this paper we introduce RCBEVDet a radar-camera fusion 3D obj
ect detection method in the bird's eye view (BEV). Specifically we first design
RadarBEVNet for radar BEV feature extraction. RadarBEVNet consists of a dual-str
eam radar backbone and a Radar Cross-Section (RCS) aware BEV encoder. In the dua
l-stream radar backbone a point-based encoder and a transformer-based encoder ar
e proposed to extract radar features with an injection and extraction module to
facilitate communication between the two encoders. The RCS-aware BEV encoder tak
es RCS as the object size prior to scattering the point feature in BEV. Besides
we present the Cross-Attention Multi-layer Fusion module to automatically align
the multi-modal BEV feature from radar and camera with the deformable attention
mechanism and then fuse the feature with channel and spatial fusion layers. Expe
rimental results show that RCBEVDet achieves new state-of-the-art radar-camera f
usion results on nuScenes and view-of-delft (VoD) 3D object detection benchmarks
. Furthermore RCBEVDet achieves better 3D detection results than all real-time c
amera-only and radar-camera 3D object detectors with a faster inference speed at
 21 28 FPS. The source code will be released at https://github.com/VDIGPKU/RCBEV

CLOAF: CoLlisiOn-Aware Human Flow
Andrey Davydov, Martin Engilberge, Mathieu Salzmann, Pascal Fua; Proceedings of
the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024,
 pp. 1176-1185
Even the best current algorithms for estimating body 3D shape and pose yield res

ults that include body self-intersections. In this paper we present CLOAF which exploits the diffeomorphic nature of Ordinary Differential Equations to eliminat e such self-intersections while still imposing body shape constraints. We show t hat unlike earlier approaches to addressing this issue ours completely eliminate s the self-intersections without compromising the accuracy of the reconstruction s. Being differentiable CLOAF can be used to fine-tune pose and shape estimation baselines to improve their overall performance and eliminate self-intersections in their predictions. Furthermore we demonstrate how our CLOAF strategy can be applied to practically any motion field induced by the user. CLOAF also makes it possible to edit motion to interact with the environment without worrying about potential collision or loss of body-shape prior.

Hybrid Functional Maps for Crease-Aware Non-Isometric Shape Matching
Lennart Bastian, Yizheng Xie, Nassir Navab, Zorah Lähner; Proceedings of the IEE E/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 33 13-3323
Non-isometric shape correspondence remains a fundamental challenge in computer v ision. Traditional methods using Laplace-Beltrami operator (LBO) eigenmodes face limitations in characterizing high-frequency extrinsic shape changes like bendi ng and creases. We propose a novel approach of combining the non-orthogonal extr insic basis of eigenfunctions of the elastic thin-shell hessian with the intrins ic ones of the LBO creating a hybrid spectral space in which we construct functi onal maps. To this end we present a theoretical framework to effectively integra te non-orthogonal basis functions into descriptor- and learning-based functional map methods. Our approach can be incorporated easily into existing functional m ap pipelines across varying applications and is able to handle complex deformati ons beyond isometries. We show extensive evaluations across various supervised a nd unsupervised settings and demonstrate significant improvements. Notably our a pproach achieves up to 15% better mean geodesic error for non-isometric correspo ndence settings and up to 45% improvement in scenarios with topological noise.
****
Density-Guided Semi-Supervised 3D Semantic Segmentation with Dual-Space Hardness Sampling
Jianan Li, Qiulei Dong; Proceedings of the IEEE/CVF Conference on Computer Visio n and Pattern Recognition (CVPR), 2024, pp. 3260-3269
Densely annotating the large-scale point clouds is laborious. To alleviate the a nnotation burden contrastive learning has attracted increasing attention for tac kling semi-supervised 3D semantic segmentation. However existing point-to-point contrastive learning techniques in literature are generally sensitive to outlier s resulting in insufficient modeling of the point-wise representations. To addre ss this problem we propose a method named DDSemi for semi-supervised 3D semantic segmentation where a density-guided contrastive learning technique is explored. This technique calculates the contrastive loss in a point-to-anchor manner by e stimating an anchor for each class from the memory bank based on the finding tha t the cluster centers tend to be located in dense regions. In this technique an inter-contrast loss is derived from the perturbed unlabeled point cloud pairs wh ile an intra-contrast loss is derived from a single unlabeled point cloud. The d erived losses could enhance the discriminability of the features and implicitly constrain the semantic consistency between the perturbed unlabeled point cloud p airs. In addition we propose a dual-space hardness sampling strategy to pay more attention to the hard samples located in sparse regions of both the geometric s pace and feature space by reweighting the point-wise intra-contrast loss. Experi mental results on both indoor-scene and outdoor-scene datasets demonstrate that the proposed method outperforms the comparative state-of-the-art semi-supervised methods.

Adaptive Softassign via Hadamard-Equipped Sinkhorn
Binrui Shen, Qiang Niu, Shengxin Zhu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 17638-17647
Softassign is a pivotal method in graph matching and other learning tasks. Many

softassign-based algorithms exhibit performance sensitivity to a parameter in th e softassign. However tuning the parameter is challenging and almost done empiri cally. This paper proposes an adaptive softassign method for graph matching by a nalyzing the relationship between the objective score and the parameter. This me thod can automatically tune the parameter based on a given error bound to guaran tee accuracy. The Hadamard-Equipped Sinkhorn formulas introduced in this study s ignificantly enhance the efficiency and stability of the adaptive softassign. Mo reover these formulas can also be used in optimal transport problems. The result ing adaptive softassign graph matching algorithm enjoys significantly higher acc uracy than previous state-of-the-art large graph matching algorithms while maint aining comparable efficiency.

Re-thinking Data Availability Attacks Against Deep Neural Networks
Bin Fang, Bo Li, Shuang Wu, Shouhong Ding, Ran Yi, Lizhuang Ma; Proceedings of t he IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 12215-12224
The unauthorized use of personal data for commercial purposes and the covert acq uisition of private data for training machine learning models continue to raise concerns. To address these issues researchers have proposed availability attacks that aim to render data unexploitable. However many availability attack methods can be easily disrupted by adversarial training. Although some robust methods c an resist adversarial training their protective effects are limited. In this pap er we re-examine the existing availability attack methods and propose a novel tw o-stage min-max-min optimization paradigm to generate robust unlearnable noise. The inner min stage is utilized to generate unlearnable noise while the outer mi n-max stage simulates the training process of the poisoned model. Additionally w e formulate the attack effects and use it to constrain the optimization objectiv e. Comprehensive experiments have revealed that the noise generated by our metho d can lead to a decline in test accuracy for adversarially trained poisoned mode ls by up to approximately 30% in comparison to SOTA methods.

ElasticDiffusion: Training-free Arbitrary Size Image Generation through Global-L ocal Content Separation
Moayed Haji-Ali, Guha Balakrishnan, Vicente Ordonez; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 6603-66 12
Diffusion models have revolutionized image generation in recent years yet they a re still limited to a few sizes and aspect ratios. We propose ElasticDiffusion a novel training-free decoding method that enables pretrained text-to-image diffu sion models to generate images with various sizes. ElasticDiffusion attempts to decouple the generation trajectory of a pretrained model into local and global s ignals. The local signal controls low-level pixel information and can be estimat ed on local patches while the global signal is used to maintain overall structur al consistency and is estimated with a reference image. We test our method on Ce lebA-HQ (faces) and LAION-COCO (objects/indoor/outdoor scenes). Our experiments and qualitative results show superior image coherence quality across aspect rati os compared to MultiDiffusion and the standard decoding strategy of Stable Diffu sion. Project Webpage: https://elasticdiffusion.github.io

Locally Adaptive Neural 3D Morphable Models
Michail Tarasiou, Rolandos Alexandros Potamias, Eimear O'Sullivan, Stylianos Plo umpis, Stefanos Zafeiriou; Proceedings of the IEEE/CVF Conference on Computer Vi sion and Pattern Recognition (CVPR), 2024, pp. 1867-1876
We present the Locally Adaptive Morphable Model (LAMM) a highly flexible Auto-En coder (AE) framework for learning to generate and manipulate 3D meshes. We train our architecture following a simple self-supervised training scheme in which in put displacements over a set of sparse control vertices are used to overwrite th e encoded geometry in order to transform one training sample into another. Durin g inference our model produces a dense output that adheres locally to the specif ied sparse geometry while maintaining the overall appearance of the encoded obje

ct. This approach results in state-of-the-art performance in both disentangling manipulated geometry and 3D mesh reconstruction. To the best of our knowledge LA MM is the first end-to-end framework that enables direct local control of 3D ver tex geometry in a single forward pass. A very efficient computational graph allo ws our network to train with only a fraction of the memory required by previous methods and run faster during inference generating 12k vertex meshes at >60fps o n a single CPU thread. We further leverage local geometry control as a primitive for higher level editing operations and present a set of derivative capabilitie s such as swapping and sampling object parts. Code and pretrained models can be found at https://github.com/michaeltrs/LAMM.

ICON: Incremental CONfidence for Joint Pose and Radiance Field Optimization
Weiyao Wang, Pierre Gleize, Hao Tang, Xingyu Chen, Kevin J Liang, Matt Feiszli; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognitio n (CVPR), 2024, pp. 5406-5417
Neural Radiance Fields (NeRF) exhibit remarkable performance for Novel View Synt hesis (NVS) given a set of 2D images. However NeRF training requires accurate ca mera pose for each input view typically obtained by Structure-from-Motion (SfM) pipelines. Recent works have attempted to relax this constraint but they still o ften rely on decent initial poses which they can refine. Here we aim at removing the requirement for pose initialization. We present Incremental CONfidence (ICO N) an optimization procedure for training NeRFs from 2D video frames. ICON only assumes smooth camera motion to estimate initial guess for poses. Further ICON i ntroduces "confidence": an adaptive measure of model quality used to dynamically reweight gradients. ICON relies on high-confidence poses to learn NeRF and high -confidence 3D structure (as encoded by NeRF) to learn poses. We show that ICON without prior pose initialization achieves superior performance in both CO3D and HO3D versus methods which use SfM pose.
****
Learned Scanpaths Aid Blind Panoramic Video Quality Assessment
Kanglong Fan, Wen Wen, Mu Li, Yifan Peng, Kede Ma; Proceedings of the IEEE/CVF C onference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 2599-2608
Panoramic videos have the advantage of providing an immersive and interactive vi ewing experience. Nevertheless their spherical nature gives rise to various and uncertain user viewing behaviors which poses significant challenges for panorami c video quality assessment (PVQA). In this work we propose an end-to-end optimiz ed blind PVQA method with explicit modeling of user viewing patterns through vis ual scanpaths. Our method consists of two modules: a scanpath generator and a qu ality assessor. The scanpath generator is initially trained to predict future sc anpaths by minimizing their expected code length and then jointly optimized with the quality assessor for quality prediction. Our blind PVQA method enables dire ct quality assessment of panoramic images by treating them as videos composed of identical frames. Experiments on three public panoramic image and video quality datasets encompassing both synthetic and authentic distortions validate the sup eriority of our blind PVQA model over existing methods.

FineSports: A Multi-person Hierarchical Sports Video Dataset for Fine-grained Ac tion Understanding
Jinglin Xu, Guohao Zhao, Sibo Yin, Wenhao Zhou, Yuxin Peng; Proceedings of the I EEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 21773-21782
Fine-grained action analysis in multi-person sports is complex due to athletes' quick movements and intense physical confrontations which result in severe visua l obstructions in most scenes. In addition accessible multi-person sports video datasets lack fine-grained action annotations in both space and time adding to t he difficulty in fine-grained action analysis. To this end we construct a new mu lti-person basketball sports video dataset named FineSports which contains fine-grained semantic and spatial-temporal annotations on 10000 NBA game videos cover ing 52 fine-grained action types 16000 action instances and 123000 spatial-tempo ral bounding boxes. We also propose a new prompt-driven spatial-temporal action

location approach called PoSTAL composed of a prompt-driven target action encode
r (PTA) and an action tube-specific detector (ATD) to directly generate target a
ction tubes with fine-grained action types without any off-line proposal generat
ion. Extensive experiments on the FineSports dataset demonstrate that PoSTAL out
performs state-of-the-art methods. Data and code are available at https://github
.com/PKU-ICST-MIPL/FineSports_CVPR2024.

SHiNe: Semantic Hierarchy Nexus for Open-vocabulary Object Detection
Mingxuan Liu, Tyler L. Hayes, Elisa Ricci, Gabriela Csurka, Riccardo Volpi; Proc
eedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (C
VPR), 2024, pp. 16634-16644
Open-vocabulary object detection (OvOD) has transformed detection into a languag
e-guided task empowering users to freely define their class vocabularies of inte
rest during inference. However our initial investigation indicates that existing
 OvOD detectors exhibit significant variability when dealing with vocabularies a
cross various semantic granularities posing a concern for real-world deployment.
 To this end we introduce Semantic Hierarchy Nexus (SHiNe) a novel classifier th
at uses semantic knowledge from class hierarchies. It runs offline in three step
s: i) it retrieves relevant super-/sub-categories from a hierarchy for each targ
et class; ii) it integrates these categories into hierarchy-aware sentences; iii
) it fuses these sentence embeddings to generate the nexus classifier vector. Ou
r evaluation on various detection benchmarks demonstrates that SHiNe enhances ro
bustness across diverse vocabulary granularities achieving up to +31.9% mAP50 wi
th ground truth hierarchies while retaining improvements using hierarchies gener
ated by large language models. Moreover when applied to open-vocabulary classifi
cation on ImageNet-1k SHiNe improves the CLIP zero-shot baseline by +2.8% accura
cy. SHiNe is training-free and can be seamlessly integrated with any off-the-she
lf OvOD detector without incurring additional computational overhead during infe
rence. The code is open source.

TI2V-Zero: Zero-Shot Image Conditioning for Text-to-Video Diffusion Models
Haomiao Ni, Bernhard Egger, Suhas Lohit, Anoop Cherian, Ye Wang, Toshiaki Koike-
Akino, Sharon X. Huang, Tim K. Marks; Proceedings of the IEEE/CVF Conference on
Computer Vision and Pattern Recognition (CVPR), 2024, pp. 9015-9025
Text-conditioned image-to-video generation (TI2V) aims to synthesize a realistic
 video starting from a given image (e.g. a woman's photo) and a text description
 (e.g. "a woman is drinking water."). Existing TI2V frameworks often require cos
tly training on video-text datasets and specific model designs for text and imag
e conditioning. In this paper we propose TI2V-Zero a zero-shot tuning-free metho
d that empowers a pretrained text-to-video (T2V) diffusion model to be condition
ed on a provided image enabling TI2V generation without any optimization fine-tu
ning or introducing external modules. Our approach leverages a pretrained T2V di
ffusion foundation model as the generative prior. To guide video generation with
 the additional image input we propose a "repeat-and-slide" strategy that modula
tes the reverse denoising process allowing the frozen diffusion model to synthes
ize a video frame-by-frame starting from the provided image. To ensure temporal
continuity we employ a DDPM inversion strategy to initialize Gaussian noise for
each newly synthesized frame and a resampling technique to help preserve visual
details. We conduct comprehensive experiments on both domain-specific and open-d
omain datasets where TI2V-Zero consistently outperforms a recent open-domain TI2
V model. Furthermore we show that TI2V-Zero can seamlessly extend to other tasks
 such as video infilling and prediction when provided with more images. Its auto
regressive design also supports long video generation.

Ranking Distillation for Open-Ended Video Question Answering with Insufficient L
abels
Tianming Liang, Chaolei Tan, Beihao Xia, Wei-Shi Zheng, Jian-Fang Hu; Proceeding
s of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR),
2024, pp. 13161-13170
This paper focuses on open-ended video question answering which aims to find the

correct answers from a large answer set in response to a video-related question. This is essentially a multi-label classification task since a question may have multiple answers. However due to annotation costs the labels in existing benchmarks are always extremely insufficient typically one answer per question. As a result existing works tend to directly treat all the unlabeled answers as negative labels leading to limited ability for generalization. In this work we introduce a simple yet effective ranking distillation framework (RADI) to mitigate this problem without additional manual annotation. RADI employs a teacher model trained with incomplete labels to generate rankings for potential answers which contain rich knowledge about label priority as well as label-associated visual cues thereby enriching the insufficient labeling information. To avoid overconfidence in the imperfect teacher model we further present two robust and parameter-free ranking distillation approaches: a pairwise approach which introduces adaptive soft margins to dynamically refine the optimization constraints on various pairwise rankings and a listwise approach which adopts sampling-based partial listwise learning to resist the bias in teacher ranking. Extensive experiments on five popular benchmarks consistently show that both our pairwise and listwise RADIs outperform state-of-the-art methods. Further analysis demonstrates the effectiveness of our methods on the insufficient labeling problem.

GARField: Group Anything with Radiance Fields
Chung Min Kim, Mingxuan Wu, Justin Kerr, Ken Goldberg, Matthew Tancik, Angjoo Kanazawa; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 21530-21539
Grouping is inherently ambiguous due to the multiple levels of granularity in which one can decompose a scene --- should the wheels of an excavator be considered separate or part of the whole? We propose Group Anything with Radiance Fields (GARField) an approach for decomposing 3D scenes into a hierarchy of semantically meaningful groups from posed image inputs. To do this we embrace group ambiguity through physical scale: by optimizing a scale-conditioned 3D affinity feature field a point in the world can belong to different groups of different sizes. We optimize this field from a set of 2D masks provided by Segment Anything (SAM) in a way that respects coarse-to-fine hierarchy using scale to consistently fuse conflicting masks from different viewpoints. From this field we can derive a hierarchy of possible groupings via automatic tree construction or user interaction. We evaluate GARField on a variety of in-the-wild scenes and find it effectively extracts groups at many levels: clusters of objects objects and various subparts. GARField inherently represents multi-view consistent groupings and produces higher fidelity groups than the input SAM masks. GARField's hierarchical grouping could have exciting downstream applications such as 3D asset extraction or dynamic scene understanding. Project site: https://www.garfield.studio/

Depth-Aware Concealed Crop Detection in Dense Agricultural Scenes
Liqiong Wang, Jinyu Yang, Yanfu Zhang, Fangyi Wang, Feng Zheng; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 17201-17211
Concealed Object Detection (COD) aims to identify objects visually embedded in their background. Existing COD datasets and methods predominantly focus on animals or humans ignoring the agricultural domain which often contains numerous small and concealed crops with severe occlusions. In this paper we introduce Concealed Crop Detection (CCD) which extends classic COD to agricultural domains. Experimental study shows that unimodal data provides insufficient information for CCD. To address this gap we first collect a large-scale RGB-D dataset ACOD-12K containing high-resolution crop images and depth maps. Then we propose a foundational framework named Recurrent Iterative Segmentation Network (RISNet). To tackle the challenge of dense objects we employ multi-scale receptive fields to capture objects of varying sizes thus enhancing the detection performance for dense objects. By fusing depth features our method can acquire spatial information about concealed objects to mitigate disturbances caused by intricate backgrounds and occlusions. Furthermore our model adopts a multi-stage iterative approach using pre

dictions from each stage as gate attention to reinforce position information the reby improving the detection accuracy for small objects. Extensive experimental results demonstrate that our RISNet achieves new state-of-the-art performance on both newly proposed CCD and classic COD tasks. All resources will be available at https://github.com/Kki2Eve/RISNet.

Learning Equi-angular Representations for Online Continual Learning
Minhyuk Seo, Hyunseo Koh, Wonje Jeung, Minjae Lee, San Kim, Hankook Lee, Sungjun Cho, Sungik Choi, Hyunwoo Kim, Jonghyun Choi; Proceedings of the IEEE/CVF Confe rence on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 23933-23942
Online continual learning suffers from an underfitted solution due to insufficie nt training for prompt model updates (e.g. single-epoch training). To address th e challenge we propose an efficient online continual learning method using the n eural collapse phenomenon. In particular we induce neural collapse to form a sim plex equiangular tight frame (ETF) structure in the representation space so that the continuously learned model with a single epoch can better fit to the stream ed data by proposing preparatory data training and residual correction in the re presentation space. With an extensive set of empirical validations using CIFAR-1 0/100 TinyImageNet ImageNet-200 and ImageNet-1K we show that our proposed method outperforms state-of-the-art methods by a noticeable margin in various online c ontinual learning scenarios such as disjoint and Gaussian scheduled continuous (i.e. boundary-free) data setups.
****
iToF-flow-based High Frame Rate Depth Imaging
Yu Meng, Zhou Xue, Xu Chang, Xuemei Hu, Tao Yue; Proceedings of the IEEE/CVF Con ference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 4929-4938
iToF is a prevalent cost-effective technology for 3D perception. While its relia nce on multi-measurement commonly leads to reduced performance in dynamic enviro nments. Based on the analysis of the physical iToF imaging process we propose th e iToF flow composed of crossmode transformation and uni-mode photometric correc tion to model the variation of measurements caused by different measurement mode s and 3D motion respectively. We propose a local linear transform (LLT) based cr oss-mode transfer module (LCTM) for mode-varying and pixel shift compensation of cross-mode flow and uni-mode photometric correct module (UPCM) for estimating t he depth-wise motion caused photometric residual of uni-mode flow. The iToF flow -based depth extraction network is proposed which could facilitate the estimatio n of the 4-phase measurements at each individual time for high framerate and acc urate depth estimation. Extensive experiments including both simulation and real -world experiments are conducted to demonstrate the effectiveness of the propose d methods. Compared with the SOTA method our approach reduces the computation ti me by 75% while improving the performance by 38%. The code and database are avai lable at https://github.com/ComputationalPerceptionLab/iToF_flow.

Solving the Catastrophic Forgetting Problem in Generalized Category Discovery
Xinzi Cao, Xiawu Zheng, Guanhong Wang, Weijiang Yu, Yunhang Shen, Ke Li, Yutong Lu, Yonghong Tian; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 16880-16889
Generalized Category Discovery (GCD) aims to identify a mix of known and novel c ategories within unlabeled data sets providing a more realistic setting for imag e recognition. Essentially GCD needs to remember existing patterns thoroughly to recognize novel categories. Recent state-of-the-art method SimGCD transfers the knowledge from known-class data to the learning of novel classes through debias ed learning. However some patterns are catastrophically forgot during adaptation and thus lead to poor performance in novel categories classification. To addres s this issue we propose a novel learning approach LegoGCD which is seamlessly in tegrated into previous methods to enhance the discrimination of novel classes wh ile maintaining performance on previously encountered known classes. Specificall y we design two types of techniques termed as \underline L ocal \underline E ntr opy Re\underline g ularization (LER) and Dual-views Kullback-Leibler divergence c\underline o nstraint (DKL). The LER optimizes the distribution of potential kn

own class samples in unlabeled data thus ensuring the preservation of knowledge related to known categories while learning novel classes. Meanwhile DKL introduces Kullback-Leibler divergence to encourage the model to produce a similar prediction distribution of two view samples from the same image. In this way it successfully avoids mismatched prediction and generates more reliable potential known class samples simultaneously. Extensive experiments validate that the proposed LegoGCD effectively addresses the known category forgetting issue across all datasets e.g. delivering a 7.74% and 2.51% accuracy boost on known and novel classes in CUB respectively. Our code is available at: https://github.com/Cliffia123/LegoGCD.

Data-Efficient Unsupervised Interpolation Without Any Intermediate Frame for 4D Medical Images
JungEun Kim, Hangyul Yoon, Geondo Park, Kyungsu Kim, Eunho Yang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 11353-11364
4D medical images which represent 3D images with temporal information are crucial in clinical practice for capturing dynamic changes and monitoring long-term disease progression. However acquiring 4D medical images poses challenges due to factors such as radiation exposure and imaging duration necessitating a balance between achieving high temporal resolution and minimizing adverse effects. Given these circumstances not only is data acquisition challenging but increasing the frame rate for each dataset also proves difficult. To address this challenge this paper proposes a simple yet effective Unsupervised Volumetric Interpolation framework UVI-Net. This framework facilitates temporal interpolation without the need for any intermediate frames distinguishing it from the majority of other existing unsupervised methods. Experiments on benchmark datasets demonstrate significant improvements across diverse evaluation metrics compared to unsupervised and supervised baselines. Remarkably our approach achieves this superior performance even when trained with a dataset as small as one highlighting its exceptional robustness and efficiency in scenarios with sparse supervision. This positions UVI-Net as a compelling alternative for 4D medical imaging particularly in settings where data availability is limited. The source code is available at https://github.com/jungeun122333/UVI-Net.

POCE: Primal Policy Optimization with Conservative Estimation for Multi-constraint Offline Reinforcement Learning
Jiayi Guan, Li Shen, Ao Zhou, Lusong Li, Han Hu, Xiaodong He, Guang Chen, Changjun Jiang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 26243-26253
Multi-constraint offline reinforcement learning (RL) promises to learn policies that satisfy both cumulative and state-wise costs from offline datasets. This arrangement provides an effective approach for the widespread application of RL in high-risk scenarios where both cumulative and state-wise costs need to be considered simultaneously. However previously constrained offline RL algorithms are primarily designed to handle single-constraint problems related to cumulative cost which faces challenges when addressing multi-constraint tasks that involve both cumulative and state-wise costs. In this work we propose a novel Primal policy Optimization with Conservative Estimation algorithm (POCE) to address the problem of multi-constraint offline RL. Concretely we reframe the objective of multi-constraint offline RL by introducing the concept of Maximum Markov Decision Processes (MMDP). Subsequently we present a primal policy optimization algorithm to confront the multi-constraint problems which improves the stability and convergence speed of model training. Furthermore we propose a conditional Bellman operator to estimate cumulative and state-wise Q-values reducing the extrapolation error caused by out-of-distribution (OOD) actions. Finally extensive experiments demonstrate that the POCE algorithm achieves competitive performance across multiple experimental tasks particularly outperforming baseline algorithms in terms of safety. Our code is available at \href https://github.com/guanjiayi/poce github.POCE .

Learning the 3D Fauna of the Web
Zizhang Li, Dor Litvak, Ruining Li, Yunzhi Zhang, Tomas Jakab, Christian Rupprecht, Shangzhe Wu, Andrea Vedaldi, Jiajun Wu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 9752-9762
Learning 3D models of all animals in nature requires massively scaling up existing solutions. With this ultimate goal in mind we develop 3D-Fauna an approach that learns a pan-category deformable 3D animal model for more than 100 animal species jointly. One crucial bottleneck of modeling animals is the limited availability of training data which we overcome by learning our model from 2D Internet images. We show that prior approaches which are category-specific fail to generalize to rare species with limited training images. We address this challenge by introducing the Semantic Bank of Skinned Models (SBSM) which automatically discovers a small set of base animal shapes by combining geometric inductive priors with semantic knowledge implicitly captured by an off-the-shelf self-supervised feature extractor. To train such a model we also contribute a new large-scale dataset of diverse animal species. At inference time given a single image of any quadruped animal our model reconstructs an articulated 3D mesh in a feed-forward manner in seconds.

Masked Spatial Propagation Network for Sparsity-Adaptive Depth Refinement
Jinyoung Jun, Jae-Han Lee, Chang-Su Kim; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 19768-19778
The main function of depth completion is to compensate for an insufficient and unpredictable number of sparse depth measurements of hardware sensors. However existing research on depth completion assumes that the sparsity --- the number of points or LiDAR lines --- is fixed for training and testing. Hence the completion performance drops severely when the number of sparse depths changes significantly. To address this issue we propose the sparsity-adaptive depth refinement (SDR) framework which refines monocular depth estimates using sparse depth points. For SDR we propose the masked spatial propagation network (MSPN) to perform SDR with a varying number of sparse depths effectively by gradually propagating sparse depth information throughout the entire depth map. Experimental results demonstrate that MPSN achieves state-of-the-art performance on both SDR and conventional depth completion scenarios.

LISA: Reasoning Segmentation via Large Language Model
Xin Lai, Zhuotao Tian, Yukang Chen, Yanwei Li, Yuhui Yuan, Shu Liu, Jiaya Jia; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 9579-9589
Although perception systems have made remarkable advancements in recent years they still rely on explicit human instruction or pre-defined categories to identify the target objects before executing visual recognition tasks. Such systems cannot actively reason and comprehend implicit user intention. In this work we propose a new segmentation task --- reasoning segmentation. The task is designed to output a segmentation mask given a complex and implicit query text. Furthermore we establish a benchmark comprising over one thousand image-instruction-mask data samples incorporating intricate reasoning and world knowledge for evaluation purposes. Finally we present LISA: large Language Instructed Segmentation Assistant which inherits the language generation capabilities of multimodal Large Language Models (LLMs) while also possessing the ability to produce segmentation masks. We expand the original vocabulary with a <SEG> token and propose the embedding-as-mask paradigm to unlock the segmentation capability. Remarkably LISA can handle cases involving complex reasoning and world knowledge. Also it demonstrates robust zero-shot capability when trained exclusively on reasoning-free datasets. In addition fine-tuning the model with merely 239 reasoning segmentation data samples results in further performance enhancement. Both quantitative and qualitative experiments show our method effectively unlocks new reasoning segmentation capabilities for multimodal LLMs. Code models and data are available at github.com/dvlab-research/LISA.

Relightful Harmonization: Lighting-aware Portrait Background Replacement
Mengwei Ren, Wei Xiong, Jae Shin Yoon, Zhixin Shu, Jianming Zhang, HyunJoon Jung, Guido Gerig, He Zhang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 6452-6462
Portrait harmonization aims to composite a subject into a new background adjusting its lighting and color to ensure harmony with the background scene. Existing harmonization techniques often only focus on adjusting the global color and brightness of the foreground and ignore crucial illumination cues from the background such as apparent lighting direction leading to unrealistic compositions. We introduce Relightful Harmonization a lighting-aware diffusion model designed to seamlessly harmonize sophisticated lighting effect for the foreground portrait using any background image. Our approach unfolds in three stages. First we introduce a lighting representation module that allows our diffusion model to encode lighting information from target image background. Second we introduce an alignment network that aligns lighting features learned from image background with lighting features learned from panorama environment maps which is a complete representation for scene illumination. Last to further boost the photorealism of the proposed method we introduce a novel data simulation pipeline that generates synthetic training pairs from a diverse range of natural images which are used to refine the model. Our method outperforms existing benchmarks in visual fidelity and lighting coherence showing superior generalization in real-world testing scenarios highlighting its versatility and practicality.

Bridging the Gap: A Unified Video Comprehension Framework for Moment Retrieval and Highlight Detection
Yicheng Xiao, Zhuoyan Luo, Yong Liu, Yue Ma, Hengwei Bian, Yatai Ji, Yujiu Yang, Xiu Li; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 18709-18719
Video Moment Retrieval (MR) and Highlight Detection (HD) have attracted significant attention due to the growing demand for video analysis. Recent approaches treat MR and HD as similar video grounding problems and address them together with transformer-based architecture. However we observe that the emphasis of MR and HD differs with one necessitating the perception of local relationships and the other prioritizing the understanding of global contexts. Consequently the lack of task-specific design will inevitably lead to limitations in associating the intrinsic specialty of two tasks. To tackle the issue we propose a Unified Video COMprehension framework (UVCOM) to bridge the gap and jointly solve MR and HD effectively. By performing progressive integration on intra and inter-modality across multi-granularity UVCOM achieves the comprehensive understanding in processing a video. Moreover we present multi-aspect contrastive learning to consolidate the local relation modeling and global knowledge accumulation via well aligned multi-modal space. Extensive experiments on QVHighlights Charades-STA TACoS YouTube Highlights and TVSum datasets demonstrate the effectiveness and rationality of UVCOM which outperforms the state-of-the-art methods by a remarkable margin.

MuseChat: A Conversational Music Recommendation System for Videos
Zhikang Dong, Xiulong Liu, Bin Chen, Pawel Polak, Peng Zhang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 12775-12785
Music recommendation for videos attracts growing interest in multi-modal research. However existing systems focus primarily on content compatibility often ignoring the users' preferences. Their inability to interact with users for further refinements or to provide explanations leads to a less satisfying experience. We address these issues with MuseChat a first-of-its-kind dialogue-based recommendation system that personalizes music suggestions for videos. Our system consists of two key functionalities with associated modules: recommendation and reasoning. The recommendation module takes a video along with optional information including previous suggested music and user's preference as inputs and retrieves an appropriate music matching the context. The reasoning module equipped with the pow

er of Large Language Model (Vicuna-7B) and extended to multi-modal inputs is able to provide reasonable explanation for the recommended music. To evaluate the effectiveness of MuseChat we build a large-scale dataset conversational music recommendation for videos that simulates a two-turn interaction between a user and a recommender based on accurate music track information. Experiment results show that MuseChat achieves significant improvements over existing video-based music retrieval methods as well as offers strong interpretability and interactability. The dataset of this work is available at https://dongzhikang.github.io/musechat.

Mitigating Motion Blur in Neural Radiance Fields with Events and Frames
Marco Cannici, Davide Scaramuzza; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 9286-9296
Neural Radiance Fields (NeRFs) have shown great potential in novel view synthesis. However they struggle to render sharp images when the data used for training is affected by motion blur. On the other hand event cameras excel in dynamic scenes as they measure brightness changes with microsecond resolution and are thus only marginally affected by blur. Recent methods attempt to enhance NeRF reconstructions under camera motion by fusing frames and events. However they face challenges in recovering accurate color content or constrain the NeRF to a set of predefined camera poses harming reconstruction quality in challenging conditions. This paper proposes a novel formulation addressing these issues by leveraging both model- and learning-based modules. We explicitly model the blur formation process exploiting the event double integral as an additional model-based prior. Additionally we model the event-pixel response using an end-to-end learnable response function allowing our method to adapt to non-idealities in the real event-camera sensor. We show on synthetic and real data that the proposed approach outperforms existing deblur NeRFs that use only frames as well as those that combine frames and events by +6.13dB and +2.48dB respectively.

C3Net: Compound Conditioned ControlNet for Multimodal Content Generation
Juntao Zhang, Yuehuai Liu, Yu-Wing Tai, Chi-Keung Tang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 26886-26895
We present Compound Conditioned ControlNet C3Net a novel generative neural architecture taking conditions from multiple modalities and synthesizing multimodal contents simultaneously (e.g. image text audio). C3Net adapts the ControlNet architecture to jointly train and make inferences on a production-ready diffusion model and its trainable copies. Specifically C3Net first aligns the conditions from multi-modalities to the same semantic latent space using modality-specific encoders based on contrastive training. Then it generates multimodal outputs based on the aligned latent space whose semantic information is combined using a ControlNet-like architecture called Control C3-UNet. Correspondingly with this system design our model offers an improved solution for joint-modality generation through learning and explaining multimodal conditions involving more than just linear interpolation within the latent space. Meanwhile as we align conditions to a unified latent space C3Net only requires one trainable Control C3-UNet to work on multimodal semantic information. Furthermore our model employs unimodal pretraining on the condition alignment stage outperforming the non-pretrained alignment even on relatively scarce training data and thus demonstrating high-quality compound condition generation. We contribute the first high-quality tri-modal validation set to validate quantitatively that C3Net outperforms or is on par with the first and contemporary state-of-the-art multimodal generation. Our codes and tri-modal dataset will be released.

Device-Wise Federated Network Pruning
Shangqian Gao, Junyi Li, Zeyu Zhang, Yanfu Zhang, Weidong Cai, Heng Huang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 12342-12352
Neural network pruning particularly channel pruning is a widely used technique f

or compressing deep learning models to enable their deployment on edge devices with limited resources. Typically redundant weights or structures are removed to achieve the target resource budget. Although data-driven pruning approaches have proven to be more effective they cannot be directly applied to federated learning (FL) which has emerged as a popular technique in edge computing applications because of distributed and confidential datasets. In response to this challenge we design a new network pruning method for FL. We propose device-wise sub-networks for each device assuming that the data distribution is similar within each device. These sub-networks are generated through sub-network embeddings and a hypernetwork. To further minimize memory usage and communication costs we permanently prune the full model to remove weights that are not useful for all devices. During the FL process we simultaneously train the device-wise sub-networks and the base sub-network to facilitate the pruning process. We then finetune the pruned model with device-wise sub-networks to regain performance. Moreover we provided the theoretical guarantee of convergence for our method. Our method achieves better performance and resource trade-off than other well-established network pruning baselines as demonstrated through extensive experiments on CIFAR-10 CIFAR-100 and TinyImageNet.

Adapt Before Comparison: A New Perspective on Cross-Domain Few-Shot Segmentation
Jonas Herzog; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 23605-23615
Few-shot segmentation performance declines substantially when facing images from a domain different than the training domain effectively limiting real-world use cases. To alleviate this recently cross-domain few-shot segmentation (CD-FSS) has emerged. Works that address this task mainly attempted to learn segmentation on a source domain in a manner that generalizes across domains. Surprisingly we can outperform these approaches while eliminating the training stage and removing their main segmentation network. We show test-time task-adaption is the key for successful CD-FSS instead. Task-adaption is achieved by appending small networks to the feature pyramid of a conventionally classification-pretrained backbone. To avoid overfitting to the few labeled samples in supervised fine-tuning consistency across augmented views of input images serves as guidance while learning the parameters of the attached layers. Despite our self-restriction not to use any images other than the few labeled samples at test time we achieve new state-of-the-art performance in CD-FSS evidencing the need to rethink approaches for the task. Code is available at https://github.com/Vision-Kek/ABCDFSS.
****
TokenHMR: Advancing Human Mesh Recovery with a Tokenized Pose Representation
Sai Kumar Dwivedi, Yu Sun, Priyanka Patel, Yao Feng, Michael J. Black; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 1323-1333
We address the problem of regressing 3D human pose and shape from a single image with a focus on 3D accuracy. The current best methods leverage large datasets of 3D pseudo-ground-truth (p-GT) and 2D keypoints leading to robust performance. With such methods however we observe a paradoxical decline in 3D pose accuracy with increasing 2D accuracy. This is caused by biases in the p-GT and the use of an approximate camera projection model. We quantify the error induced by current camera models and show that fitting 2D keypoints and p-GT accurately causes incorrect 3D poses. Our analysis defines the invalid distances within which minimizing 2D and p-GT losses is detrimental. We use this to formulate a new loss "Threshold-Adaptive Loss Scaling" (TALS) that penalizes gross 2D and p-GT errors but not smaller ones. With such a loss there are many 3D poses that could equally explain the 2D evidence. To reduce this ambiguity we need a prior over valid human poses but such priors can introduce unwanted bias. To address this we exploit a tokenized representation of human pose and reformulate the problem as token prediction. This restricts the estimated poses to the space of valid poses effectively improving robustness to occlusion. Extensive experiments on the EMDB and 3DPW datasets show that our reformulated loss and tokenization allows us to train on in-the-wild data while improving 3D accuracy over the state-of-the-art. Our mo

dels and code are available for research at https://tokenhmr.is.tue.mpg.de.

MoReVQA: Exploring Modular Reasoning Models for Video Question Answering
Juhong Min, Shyamal Buch, Arsha Nagrani, Minsu Cho, Cordelia Schmid; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 13235-13245
This paper addresses the task of video question answering (videoQA) via a decomposed multi-stage modular reasoning framework. Previous modular methods have shown promise with a single planning stage ungrounded in visual content. However through a simple and effective baseline we find that such systems can lead to brittle behavior in practice for challenging videoQA settings. Thus unlike traditional single-stage planning methods we propose a multi-stage system consisting of an event parser a grounding stage and a final reasoning stage in conjunction with an external memory. All stages are training-free and performed using few-shot prompting of large models creating interpretable intermediate outputs at each stage. By decomposing the underlying planning and task complexity our method MoReVQA improves over prior work on standard videoQA benchmarks (NExT-QA iVQA EgoSchema and ActivityNet-QA) with state-of-the-art results and extensions to related tasks (grounded videoQA paragraph captioning).

Low-Rank Rescaled Vision Transformer Fine-Tuning: A Residual Design Approach
Wei Dong, Xing Zhang, Bihui Chen, Dawei Yan, Zhijun Lin, Qingsen Yan, Peng Wang, Yang Yang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 16101-16110
Parameter-efficient fine-tuning for pre-trained Vision Transformers aims to adeptly tailor a model to downstream tasks by learning a minimal set of new adaptation parameters while preserving the frozen majority of pre-trained parameters. Striking a balance between retaining the generalizable representation capacity of the pre-trained model and acquiring task-specific features poses a key challenge. Currently there is a lack of focus on guiding this delicate trade-off. In this study we approach the problem from the perspective of Singular Value Decomposition (SVD) of pre-trained parameter matrices providing insights into the tuning dynamics of existing methods. Building upon this understanding we propose a Residual-based Low-Rank Rescaling (RLRR) fine-tuning strategy. This strategy not only enhances flexibility in parameter tuning but also ensures that new parameters do not deviate excessively from the pre-trained model through a residual design. Extensive experiments demonstrate that our method achieves competitive performance across various downstream image classification tasks all while maintaining comparable new parameters. We believe this work takes a step forward in offering a unified perspective for interpreting existing methods and serves as motivation for the development of new approaches that move closer to effectively considering the crucial trade-off mentioned above. Our code is available at https://github.com/zstarN70/RLRR.git.

FaceCom: Towards High-fidelity 3D Facial Shape Completion via Optimization and Inpainting Guidance
Yinglong Li, Hongyu Wu, Xiaogang Wang, Qingzhao Qin, Yijiao Zhao, Yong Wang, Aimin Hao; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 2177-2186
We propose FaceCom a method for 3D facial shape completion which delivers high-fidelity results for incomplete facial inputs of arbitrary forms. Unlike end-to-end shape completion methods based on point clouds or voxels our approach relies on a mesh-based generative network that is easy to optimize enabling it to handle shape completion for irregular facial scans. We first train a shape generator on a mixed 3D facial dataset containing 2405 identities. Based on the incomplete facial input we fit complete faces using an optimization approach under image inpainting guidance. The completion results are refined through a post-processing step. FaceCom demonstrates the ability to effectively and naturally complete facial scan data with varying missing regions and degrees of missing areas. Our method can be used in medical prosthetic fabrication and the registration of defic

ient scanning data. Our experimental results demonstrate that FaceCom achieves exceptional performance in fitting and shape completion tasks.

Distribution-aware Knowledge Prototyping for Non-exemplar Lifelong Person Re-identification
Kunlun Xu, Xu Zou, Yuxin Peng, Jiahuan Zhou; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 16604-16613
Lifelong person re-identification (LReID) suffers from the catastrophic forgetting problem when learning from non-stationary data. Existing exemplar-based and knowledge distillation-based LReID methods encounter data privacy and limited acquisition capacity respectively. In this paper we instead introduce the prototype which is under-investigated in LReID to better balance knowledge forgetting and acquisition. Existing prototype-based works primarily focus on the classification task where the prototypes are set as discrete points or statistical distributions. However they either discard the distribution information or omit instance-level diversity which are crucial fine-grained clues for LReID. To address the above problems we propose Distribution-aware Knowledge Prototyping (DKP) where the instance-level diversity of each sample is modeled to transfer comprehensive fine-grained knowledge for prototyping and facilitating LReID learning. Specifically an Instance-level Distribution Modeling network is proposed to capture the local diversity of each instance. Then the Distribution-oriented Prototype Generation algorithm transforms the instance-level diversity into identity-level distributions as prototypes which is further explored by the designed Prototype-based Knowledge Transfer module to enhance the knowledge anti-forgetting and acquisition capacity of the LReID model. Extensive experiments verify that our method achieves superior plasticity and stability balancing and outperforms existing LReID methods by 8.1%/9.1% average mAP/R@1 improvement. The code is available at https://github.com/zhoujiahuan1991/CVPR2024-DKP
****
LightOctree: Lightweight 3D Spatially-Coherent Indoor Lighting Estimation
Xuecan Wang, Shibang Xiao, Xiaohui Liang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 4536-4545
We present a lightweight solution for estimating spatially-coherent indoor lighting from a single RGB image. Previous methods for estimating illumination using volumetric representations have overlooked the sparse distribution of light sources in space necessitating substantial memory and computational resources for achieving high-quality results. We introduce a unified voxel octree-based illumination estimation framework to produce 3D spatially-coherent lighting. Additionally a differentiable voxel octree cone tracing rendering layer is proposed to eliminate regular volumetric representation throughout the entire process and ensure the retention of features across different frequency domains. This reduction significantly decreases spatial usage and required floating-point operations without substantially compromising precision. Experimental results demonstrate that our approach achieves high-quality coherent estimation with minimal cost compared to previous methods.

Generating Enhanced Negatives for Training Language-Based Object Detectors
Shiyu Zhao, Long Zhao, Vijay Kumar B G, Yumin Suh, Dimitris N. Metaxas, Manmohan Chandraker, Samuel Schulter; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 13592-13602
The recent progress in language-based open-vocabulary object detection can be largely attributed to finding better ways of leveraging large-scale data with free-form text annotations. Training such models with a discriminative objective function has proven successful but requires good positive and negative samples. However the free-form nature and the open vocabulary of object descriptions make the space of negatives extremely large. Prior works randomly sample negatives or use rule-based techniques to build them. In contrast we propose to leverage the vast knowledge built into modern generative models to automatically build negatives that are more relevant to the original data. Specifically we use large-language-models to generate negative text descriptions and text-to-image diffusion mod

els to also generate corresponding negative images. Our experimental analysis confirms the relevance of the generated negative data and its use in language-based detectors improves performance on two complex benchmarks. Code is available at https://github.com/xiaofeng94/Gen-Enhanced-Negs.

Insect-Foundation: A Foundation Model and Large-scale 1M Dataset for Visual Insect Understanding
Hoang-Quan Nguyen, Thanh-Dat Truong, Xuan Bac Nguyen, Ashley Dowling, Xin Li, Khoa Luu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 21945-21955
In precision agriculture the detection and recognition of insects play an essential role in the ability of crops to grow healthy and produce a high-quality yield. The current machine vision model requires a large volume of data to achieve high performance. However there are approximately 5.5 million different insect species in the world. None of the existing insect datasets can cover even a fraction of them due to varying geographic locations and acquisition costs. In this paper we introduce a novel "Insect-1M" dataset a game-changing resource poised to revolutionize insect-related foundation model training. Covering a vast spectrum of insect species our dataset including 1 million images with dense identification labels of taxonomy hierarchy and insect descriptions offers a panoramic view of entomology enabling foundation models to comprehend visual and semantic information about insects like never before. Then to efficiently establish an Insect Foundation Model we develop a micro-feature self-supervised learning method with a Patch-wise Relevant Attention mechanism capable of discerning the subtle differences among insect images. In addition we introduce Description Consistency loss to improve micro-feature modeling via insect descriptions. Through our experiments we illustrate the effectiveness of our proposed approach in insect modeling and achieve State-of-the-Art performance on standard benchmarks of insect-related tasks. Our Insect Foundation Model and Dataset promise to empower the next generation of insect-related vision models bringing them closer to the ultimate goal of precision agriculture.

Data-Efficient Multimodal Fusion on a Single GPU
Noël Vouitsis, Zhaoyan Liu, Satya Krishna Gorti, Valentin Villecroze, Jesse C. Cresswell, Guangwei Yu, Gabriel Loaiza-Ganem, Maksims Volkovs; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 27239-27251
The goal of multimodal alignment is to learn a single latent space that is shared between multimodal inputs. The most powerful models in this space have been trained using massive datasets of paired inputs and large-scale computational resources making them prohibitively expensive to train in many practical scenarios. We surmise that existing unimodal encoders pre-trained on large amounts of unimodal data should provide an effective bootstrap to create multimodal models from unimodal ones at much lower costs. We therefore propose FuseMix a multimodal augmentation scheme that operates on the latent spaces of arbitrary pre-trained unimodal encoders. Using FuseMix for multimodal alignment we achieve competitive performance - and in certain cases outperform state-of-the art methods - in both image-text and audio-text retrieval with orders of magnitude less compute and data: for example we outperform CLIP on the Flickr30K text-to-image retrieval task with ?600x fewer GPU days and ?80x fewer image-text pairs. Additionally we show how our method can be applied to convert pre-trained text-to-image generative models into audio-to-image ones. Code is available at: https://github.com/layer6ai-labs/fusemix.

FedSelect: Personalized Federated Learning with Customized Selection of Parameters for Fine-Tuning
Rishub Tamirisa, Chulin Xie, Wenxuan Bao, Andy Zhou, Ron Arel, Aviv Shamsian; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 23985-23994
Standard federated learning approaches suffer when client data distributions hav

e sufficient heterogeneity. Recent methods addressed the client data heterogeneity issue via personalized federated learning (PFL) - a class of FL algorithms aiming to personalize learned global knowledge to better suit the clients' local data distributions. Existing PFL methods usually decouple global updates in deep neural networks by performing personalization on particular layers (i.e. classifier heads) and global aggregation for the rest of the network. However preselecting network layers for personalization may result in suboptimal storage of global knowledge. In this work we propose FedSelect a novel PFL algorithm inspired by the iterative subnetwork discovery procedure used for the Lottery Ticket Hypothesis. FedSelect incrementally expands subnetworks to personalize client parameters concurrently conducting global aggregations on the remaining parameters. This approach enables the personalization of both client parameters and subnetwork structure during the training process. Finally we show that FedSelect outperforms recent state-of-the-art PFL algorithms under challenging client data heterogeneity settings and demonstrates robustness to various real-world distributional shifts.

FaceLift: Semi-supervised 3D Facial Landmark Localization
David Ferman, Pablo Garrido, Gaurav Bharaj; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 1781-1791
3D facial landmark localization has proven to be of particular use for applications such as face tracking 3D face modeling and image-based 3D face reconstruction. In the supervised learning case such methods usually rely on 3D landmark datasets derived from 3DMM-based registration that often lack spatial definition alignment as compared with that chosen by hand-labeled human consensus e.g. how are eyebrow landmarks defined? This creates a gap between landmark datasets generated via high-quality 2D human labels and 3DMMs and it ultimately limits their effectiveness. To address this issue we introduce a novel semi-supervised learning approach that learns 3D landmarks by directly lifting (visible) hand-labeled 2D landmarks and ensures better definition alignment without the need for 3D landmark datasets. To lift 2D landmarks to 3D we leverage 3D-aware GANs for better multi-view consistency learning and in-the-wild multi-frame videos for robust cross-generalization. Empirical experiments demonstrate that our method not only achieves better definition alignment between 2D-3D landmarks but also outperforms other supervised learning 3D landmark localization methods on both 3DMM labeled and photogrammetric ground truth evaluation datasets. Project Page: https://davidcferman.github.io/FaceLift

PSDPM: Prototype-based Secondary Discriminative Pixels Mining for Weakly Supervised Semantic Segmentation
Xinqiao Zhao, Ziqian Yang, Tianhong Dai, Bingfeng Zhang, Jimin Xiao; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 3437-3446
Image-level Weakly Supervised Semantic Segmentation (WSSS) has received increasing attention due to its low annotation cost. Class Activation Mapping (CAM) generated through classifier weights in WSSS inevitably ignores certain useful cues while the CAM generated through class prototypes can alleviate that. However because of the different goals of image classification and semantic segmentation the class prototypes still focus on activating primary discriminative pixels learned from classification loss leading to incomplete CAM. In this paper we propose a plugand-play Prototype-based Secondary Discriminative Pixels Mining (PSDPM) framework for enabling class prototypes to activate more secondary discriminative pixels thus generating a more complete CAM. Specifically we introduce a Foreground Pixel Estimation Module (FPEM) for estimating potential foreground pixels based on the correlations between primary and secondary discriminative pixels and the semantic segmentation results of baseline methods. Then we enable WSSS model to learn discriminative features from secondary discriminative pixels through a consistency loss calculated between FPEM result and class-prototype CAM. Experimental results show that our PSDPM improves various baseline methods significantly and achieves new state-of-the-art performances on WSSS benchmarks. Codes are a

vailable at https://github.com/xinqiaozhao/PSDPM.

Bidirectional Multi-Scale Implicit Neural Representations for Image Deraining
Xiang Chen, Jinshan Pan, Jiangxin Dong; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 25627-25636
How to effectively explore multi-scale representations of rain streaks is important for image deraining. In contrast to existing Transformer-based methods that depend mostly on single-scale rain appearance we develop an end-to-end multi-scale Transformer that leverages the potentially useful features in various scales to facilitate high-quality image reconstruction. To better explore the common degradation representations from spatially-varying rain streaks we incorporate intra-scale implicit neural representations based on pixel coordinates with the degraded inputs in a closed-loop design enabling the learned features to facilitate rain removal and improve the robustness of the model in complex scenarios. To ensure richer collaborative representation from different scales we embed a simple yet effective inter-scale bidirectional feedback operation into our multi-scale Transformer by performing coarse-to-fine and fine-to-coarse information communication. Extensive experiments demonstrate that our approach named as NeRD-Rain performs favorably against the state-of-the-art ones on both synthetic and real-world benchmark datasets. The source code and trained models are available at https://github.com/cschenxiang/NeRD-Rain.

Frozen CLIP: A Strong Backbone for Weakly Supervised Semantic Segmentation
Bingfeng Zhang, Siyue Yu, Yunchao Wei, Yao Zhao, Jimin Xiao; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 3796-3806
Weakly supervised semantic segmentation has witnessed great achievements with image-level labels. Several recent approaches use the CLIP model to generate pseudo labels for training an individual segmentation model while there is no attempt to apply the CLIP model as the backbone to directly segment objects with image-level labels. In this paper we propose WeCLIP a CLIP-based single-stage pipeline for weakly supervised semantic segmentation. Specifically the frozen CLIP model is applied as the backbone for semantic feature extraction and a new decoder is designed to interpret extracted semantic features for final prediction. Meanwhile we utilize the above frozen backbone to generate pseudo labels for training the decoder. Such labels cannot be optimized during training. We then propose a refinement module (RFM) to rectify them dynamically. Our architecture enforces the proposed decoder and RFM to benefit from each other to boost the final performance. Extensive experiments show that our approach significantly outperforms other approaches with less training cost. Additionally our WeCLIP also obtains promising results for fully supervised settings. The code is available at https://github.com/zbf1991/WeCLIP.

FedAS: Bridging Inconsistency in Personalized Federated Learning
Xiyuan Yang, Wenke Huang, Mang Ye; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 11986-11995
Personalized Federated Learning (PFL) is primarily designed to provide customized models for each client to better fit the non-iid distributed client data which is a inherent challenge in Federated Learning. However current PFL methods suffer from inconsistencies in both intra-client and inter-client levels: 1) The intra-client inconsistency stems from the asynchronous update strategy for personalized and shared parameters. In PFL clients update their shared parameters to communicate and learn from others while keeping personalized parts unchanged leading to poor coordination between these two components. 2) The Inter-client inconsistency arises from "stragglers" - inactive clients that communicate and train with the server less frequently. This results in their under-trained personalized models and impedes the collaborative training stage for other clients. In this paper we present a novel PFL framework named FedAS which uses Federated Parameter-Alignment and Client-Synchronization to overcome above challenges. Initially we enhance the localization of global parameters by infusing them with local insig

hts. We make the shared parts learn from previous model thereby increasing their
 local relevance and reducing the impact of parameter inconsistency. Furthermore
 we design a robust aggregation method to mitigate the impact of stragglers by p
reventing the incorporation of their under-trained knowledge into aggregated mod
el. Experimental results on Cifar10 and Cifar100 validate the effectiveness of o
ur FedAS in achieving better performance and robustness against data heterogenei
ty.

LAFS: Landmark-based Facial Self-supervised Learning for Face Recognition
Zhonglin Sun, Chen Feng, Ioannis Patras, Georgios Tzimiropoulos; Proceedings of
the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024,
 pp. 1639-1649
In this work we focus on learning facial representations that can be adapted to
train effective face recognition models particularly in the absence of labels. F
irstly compared with existing labelled face datasets a vastly larger magnitude o
f unlabeled faces exists in the real world. We explore the learning strategy of
these unlabeled facial images through self-supervised pretraining to transfer ge
neralized face recognition performance. Moreover motivated by one recent finding
 that is the face saliency area is critical for face recognition in contrast to
utilizing random cropped blocks of images for constructing augmentations in pret
raining we utilize patches localized by extracted facial landmarks. This enables
 our method - namely Landmark-based Facial Self-supervised learning (LAFS) to le
arn key representation that is more critical for face recognition. We also incor
porate two landmark-specific augmentations which introduce more diversity of lan
dmark information to further regularize the learning. With learned landmark-base
d facial representations we further adapt the representation for face recognitio
n with regularization mitigating variations in landmark positions. Our method ac
hieves significant improvement over the state-of-the-art on multiple face recogn
ition benchmarks especially on more challenging few-shot scenarios. The code is
available at https://github.com/szlbiubiubiu/LAFS_CVPR2024

SED: A Simple Encoder-Decoder for Open-Vocabulary Semantic Segmentation
Bin Xie, Jiale Cao, Jin Xie, Fahad Shahbaz Khan, Yanwei Pang; Proceedings of the
 IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp
. 3426-3436
Open-vocabulary semantic segmentation strives to distinguish pixels into differe
nt semantic groups from an open set of categories. Most existing methods explore
 utilizing pre-trained vision-language models in which the key is to adopt the i
mage-level model for pixel-level segmentation task. In this paper we propose a s
imple encoder-decoder named SED for open-vocabulary semantic segmentation which
comprises a hierarchical encoder-based cost map generation and a gradual fusion
decoder with category early rejection. The hierarchical encoder-based cost map g
eneration employs hierarchical backbone instead of plain transformer to predict
pixel-level image-text cost map. Compared to plain transformer hierarchical back
bone better captures local spatial information and has linear computational comp
lexity with respect to input size. Our gradual fusion decoder employs a top-down
 structure to combine cost map and the feature maps of different backbone levels
 for segmentation. To accelerate inference speed we introduce a category early r
ejection scheme in the decoder that rejects many no-existing categories at the e
arly layer of decoder resulting in at most 4.7 times acceleration without accura
cy degradation. Experiments are performed on multiple open-vocabulary semantic s
egmentation datasets which demonstrates the efficacy of our SED method. When usi
ng ConvNeXt-B our SED method achieves mIoU score of 31.6% on ADE20K with 150 cat
egories at 82 millisecond (ms) per image on a single A6000. Our source code is a
vailable at https://github.com/xb534/SED.

GPLD3D: Latent Diffusion of 3D Shape Generative Models by Enforcing Geometric an
d Physical Priors
Yuan Dong, Qi Zuo, Xiaodong Gu, Weihao Yuan, Zhengyi Zhao, Zilong Dong, Liefeng
Bo, Qixing Huang; Proceedings of the IEEE/CVF Conference on Computer Vision and

Pattern Recognition (CVPR), 2024, pp. 56-66
State-of-the-art man-made shape generative models usually adopt established generative models under a suitable implicit shape representation. A common theme is to perform distribution alignment which does not explicitly model important shape priors. As a result many synthetic shapes are not connected. Other synthetic shapes present problems of physical stability and geometric feasibility. This paper introduces a novel latent diffusion shape-generative model regularized by a quality checker that outputs a score of a latent code. The scoring function employs a learned function that provides a geometric feasibility score and a deterministic procedure to quantify a physical stability score. The key to our approach is a new diffusion procedure that combines the discrete empirical data distribution and a continuous distribution induced by the quality checker. We introduce a principled approach to determine the tradeoff parameters for learning the denoising network at different noise levels. Experimental results show that our approach outperforms state-of-the-art shape generations quantitatively and qualitatively on ShapeNet-v2.

Enhancing Quality of Compressed Images by Mitigating Enhancement Bias Towards Compression Domain
Qunliang Xing, Mai Xu, Shengxi Li, Xin Deng, Meisong Zheng, Huaida Liu, Ying Chen; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 25501-25511
Existing quality enhancement methods for compressed images focus on aligning the enhancement domain with the raw domain to yield realistic images. However these methods exhibit a pervasive enhancement bias towards the compression domain inadvertently regarding it as more realistic than the raw domain. This bias makes enhanced images closely resemble their compressed counterparts thus degrading their perceptual quality. In this paper we propose a simple yet effective method to mitigate this bias and enhance the quality of compressed images. Our method employs a conditional discriminator with the compressed image as a key condition and then incorporates a domain-divergence regularization to actively distance the enhancement domain from the compression domain. Through this dual strategy our method enables the discrimination against the compression domain and brings the enhancement domain closer to the raw domain. Comprehensive quality evaluations confirm the superiority of our method over other state-of-the-art methods without incurring inference overheads.

LangSplat: 3D Language Gaussian Splatting
Minghan Qin, Wanhua Li, Jiawei Zhou, Haoqian Wang, Hanspeter Pfister; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 20051-20060
Humans live in a 3D world and commonly use natural language to interact with a 3D scene. Modeling a 3D language field to support open-ended language queries in 3D has gained increasing attention recently. This paper introduces LangSplat which constructs a 3D language field that enables precise and efficient open-vocabulary querying within 3D spaces. Unlike existing methods that ground CLIP language embeddings in a NeRF model LangSplat advances the field by utilizing a collection of 3D Gaussians each encoding language features distilled from CLIP to represent the language field. By employing a tile-based splatting technique for rendering language features we circumvent the costly rendering process inherent in NeRF. Instead of directly learning CLIP embeddings LangSplat first trains a scene-wise language autoencoder and then learns language features on the scene-specific latent space thereby alleviating substantial memory demands imposed by explicit modeling. Existing methods struggle with imprecise and vague 3D language fields which fail to discern clear boundaries between objects. We delve into this issue and propose to learn hierarchical semantics using SAM thereby eliminating the need for extensively querying the language field across various scales and the regularization of DINO features. Extensive experimental results show that LangSplat significantly outperforms the previous state-of-the-art method LERF by a large margin. Notably LangSplat is extremely efficient achieving a 199 x speedup co

mpared to LERF at the resolution of 1440 x 1080. We strongly recommend readers t
o check out our video results at https://langsplat.github.io/.

MoST: Multi-Modality Scene Tokenization for Motion Prediction
Norman Mu, Jingwei Ji, Zhenpei Yang, Nate Harada, Haotian Tang, Kan Chen, Charle
s R. Qi, Runzhou Ge, Kratarth Goel, Zoey Yang, Scott Ettinger, Rami Al-Rfou, Dra
gomir Anguelov, Yin Zhou; Proceedings of the IEEE/CVF Conference on Computer Vis
ion and Pattern Recognition (CVPR), 2024, pp. 14988-14999
Many existing motion prediction approaches rely on symbolic perception outputs t
o generate agent trajectories such as bounding boxes road graph information and
traffic lights. This symbolic representation is a high-level abstraction of the
real world which may render the motion prediction model vulnerable to perception
 errors (e.g. failures in detecting open-vocabulary obstacles) while missing sal
ient information from the scene context (e.g. poor road conditions). An alternat
ive paradigm is end-to-end learning from raw sensors. However this approach suff
ers from the lack of interpretability and requires significantly more training r
esources. In this work we propose tokenizing the visual world into a compact set
 of scene elements and then leveraging pre-trained image foundation models and L
iDAR neural networks to encode all the scene elements in an open-vocabulary mann
er. The image foundation model enables our scene tokens to encode the general kn
owledge of the open world while the LiDAR neural network encodes geometry inform
ation. Our proposed representation can efficiently encode the multi-frame multi-
modality observations with a few hundred tokens and is compatible with most tran
sformer-based architectures. To evaluate our method we have augmented Waymo Open
 Motion Dataset with camera embeddings. Experiments over Waymo Open Motion Datas
et show that our approach leads to significant performance improvements over the
 state-of-the-art.

PIGEON: Predicting Image Geolocations
Lukas Haas, Michal Skreta, Silas Alberti, Chelsea Finn; Proceedings of the IEEE/
CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 1289
3-12902
Planet-scale image geolocalization remains a challenging problem due to the dive
rsity of images originating from anywhere in the world. Although approaches base
d on vision transformers have made significant progress in geolocalization accur
acy success in prior literature is constrained to narrow distributions of images
 of landmarks and performance has not generalized to unseen places. We present a
 new geolocalization system that combines semantic geocell creation multi-task c
ontrastive pretraining and a novel loss function. Additionally our work is the f
irst to perform retrieval over location clusters for guess refinements. We train
 two models for evaluations on street-level data and general-purpose image geolo
calization; the first model PIGEON is trained on data from the game of GeoGuessr
 and is capable of placing over 40% of its guesses within 25 kilometers of the t
arget location globally. We also develop a bot and deploy PIGEON in a blind expe
riment against humans ranking in the top 0.01% of players. We further challenge
one of the world's foremost professional GeoGuessr players to a series of six ma
tches with millions of viewers winning all six games. Our second model PIGEOTTO
differs in that it is trained on a dataset of images from Flickr and Wikipedia a
chieving state-of-the-art results on a wide range of image geolocalization bench
marks outperforming the previous SOTA by up to 7.7 percentage points on the city
 accuracy level and up to 38.8 percentage points on the country level. Our findi
ngs suggest that PIGEOTTO is the first image geolocalization model that effectiv
ely generalizes to unseen places and that our approach can pave the way for high
ly accurate planet-scale image geolocalization systems. Our code is available on
 GitHub.

Improving Spectral Snapshot Reconstruction with Spectral-Spatial Rectification
Jiancheng Zhang, Haijin Zeng, Yongyong Chen, Dengxiu Yu, Yin-Ping Zhao; Proceedi
ngs of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR)
, 2024, pp. 25817-25826

How to effectively utilize the spectral and spatial characteristics of Hyperspec tral Image (HSI) is always a key problem in spectral snapshot reconstruction. Re cently the spectra-wise transformer has shown great potential in capturing inter -spectra similarities of HSI but the classic design of the transformer i.e. mult i-head division in the spectral (channel) dimension hinders the modeling of glob al spectral information and results in mean effect. In addition previous methods adopt the normal spatial priors without taking imaging processes into account a nd fail to address the unique spatial degradation in snapshot spectral reconstru ction. In this paper we analyze the influence of multi-head division and propose a novel Spectral-Spatial Rectification (SSR) method to enhance the utilization of spectral information and improve spatial degradation. Specifically SSR includ es two core parts: Window-based Spectra-wise Self-Attention (WSSA) and spAtial R ectification Block (ARB). WSSA is proposed to capture global spectral informatio n and account for local differences whereas ARB aims to mitigate the spatial deg radation using a spatial alignment strategy. The experimental results on simulat ion and real scenes demonstrate the effectiveness of the proposed modules and we also provide models at multiple scales to demonstrate the superiority of our ap proach.

Self-correcting LLM-controlled Diffusion Models
Tsung-Han Wu, Long Lian, Joseph E. Gonzalez, Boyi Li, Trevor Darrell; Proceeding s of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 6327-6336
Text-to-image generation has witnessed significant progress with the advent of d iffusion models. Despite the ability to generate photorealistic images current t ext-to-image diffusion models still often struggle to accurately interpret and f ollow complex input text prompts. In contrast to existing models that aim to gen erate images only with their best effort we introduce Self-correcting LLM-contro lled Diffusion (SLD). SLD is a framework that generates an image from the input prompt assesses its alignment with the prompt and performs self-corrections on t he inaccuracies in the generated image. Steered by an LLM controller SLD turns t ext-to-image generation into an iterative closed-loop process ensuring correctne ss in the resulting image. SLD is not only training-free but can also be seamles sly integrated with diffusion models behind API access such as DALL-E 3 to furth er boost the performance of state-of-the-art diffusion models. Experimental resu lts show that our approach can rectify a majority of incorrect generations parti cularly in generative numeracy attribute binding and spatial relationships. Furt hermore by simply adjusting the instructions to the LLM SLD can perform image ed iting tasks bridging the gap between text-to-image generation and image editing pipelines. Our code is available at: https://self-correcting-llm-diffusion.githu b.io.

PACER+: On-Demand Pedestrian Animation Controller in Driving Scenarios
Jingbo Wang, Zhengyi Luo, Ye Yuan, Yixuan Li, Bo Dai; Proceedings of the IEEE/CV F Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 718-72 8
We address the challenge of content diversity and controllability in pedestrian simulation for driving scenarios. Recent pedestrian animation frameworks have a significant limitation wherein they primarily focus on either following trajecto ry or the content of the reference video consequently overlooking the potential diversity of human motion within such scenarios. This limitation restricts the a bility to generate pedestrian behaviors that exhibit a wider range of variations and realistic motions and therefore restricts its usage to provide rich motion content for other components in the driving simulation system e.g. suddenly chan ged motion to which the autonomous vehicle should respond. In our approach we st rive to surpass the limitation by showcasing diverse human motions obtained from various sources such as generated human motions in addition to following the gi ven trajectory. The fundamental contribution of our framework lies in combining the motion tracking task with trajectory following which enables the tracking of specific motion parts (e.g. upper body) while simultaneously following the give

n trajectory by a single policy. This way we significantly enhance both the dive rsity of simulated human motion within the given scenario and the controllabilit y of the content including language-based control. Our framework facilitates the generation of a wide range of human motions contributing to greater realism and adaptability in pedestrian simulations for driving scenarios.

LTM: Lightweight Textured Mesh Extraction and Refinement of Large Unbounded Scen es for Efficient Storage and Real-time Rendering
Jaehoon Choi, Rajvi Shah, Qinbo Li, Yipeng Wang, Ayush Saraf, Changil Kim, Jia-B in Huang, Dinesh Manocha, Suhib Alsisan, Johannes Kopf; Proceedings of the IEEE/ CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 5053 -5063
Advancements in neural signed distance fields (SDFs) have enabled modeling 3D su rface geometry from a set of 2D images of real-world scenes. Baking neural SDFs can extract explicit mesh with appearance baked into texture maps as neural feat ures. The baked meshes still have a large memory footprint and require a powerfu l GPU for real-time rendering. Neural optimization of such large meshes with dif ferentiable rendering pose significant challenges. We propose a method to produc e optimized meshes for large unbounded scenes with low triangle budget and high fidelity of geometry and appearance. We achieve this by combining advancements i n baking neural SDFs with classical mesh simplification techniques and proposing a joint appearance-geometry refinement step. The visual quality is comparable t o or better than state-of-the-art neural meshing and baking methods with high ge ometric accuracy despite significant reduction in triangle count making the prod uced meshes efficient for storage transmission and rendering on mobile hardware. We validate the effectiveness of the proposed method on large unbounded scenes from mip-NeRF 360 Tanks & Temples and Deep Blending datasets achieving at-par re ndering quality with 73x reduced triangles and 11x reduction in memory footprint .

Don't Drop Your Samples! Coherence-Aware Training Benefits Conditional Diffusion
Nicolas Dufour, Victor Besnier, Vicky Kalogeiton, David Picard; Proceedings of t he IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 6264-6273
Conditional diffusion models are powerful generative models that can leverage va rious types of conditional information such as class labels segmentation masks o r text captions. However in many real-world scenarios conditional information ma y be noisy or unreliable due to human annotation errors or weak alignment. In th is paper we propose the Coherence-Aware Diffusion (CAD) a novel method to integr ate confidence in conditional information into diffusion models allowing them to learn from noisy annotations without discarding data. We assume that each data point has an associated confidence score that reflects the quality of the condit ional information. We then condition the diffusion model on both the conditional information and the confidence score. In this way the model learns to ignore or discount the conditioning when the confidence is low. We show that our method i s theoretically sound and empirically effective on various conditional generatio n tasks. Moreover we show that leveraging confidence generates realistic and div erse samples that respect conditional information better than models trained on cleaned datasets where samples with low confidence have been discarded.

Flow-Guided Online Stereo Rectification for Wide Baseline Stereo
Anush Kumar, Fahim Mannan, Omid Hosseini Jafari, Shile Li, Felix Heide; Proceedi ngs of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR) , 2024, pp. 15375-15385
Stereo rectification is widely considered "solved" due to the abundance of tradi tional approaches to perform rectification. However autonomous vehicles and robo ts in-the-wild require constant re-calibration due to exposure to various enviro nmental factors including vibration and structural stress when cameras are arran ged in a wide-baseline configuration. Conventional rectification methods fail in these challenging scenarios: especially for larger vehicles such as autonomous

freight trucks and semi-trucks the resulting incorrect rectification severely affects the quality of downstream tasks that use stereo/multi-view data. To tackle these challenges we propose an online rectification approach that operates at real-time rates while achieving high accuracy. We propose a novel learning-based online calibration approach that utilizes stereo correlation volumes built from a feature representation obtained from cross-image attention. Our model is trained to minimize vertical optical flow as proxy rectification constraint and predicts the relative rotation between the stereo pair. The method is real-time and even outperforms conventional methods used for offline calibration and substantially improves downstream stereo depth post-rectification. We release two public datasets (https://light.princeton.edu/online-stereo-recification/) a synthetic and experimental wide baseline dataset to foster further research.

DNGaussian: Optimizing Sparse-View 3D Gaussian Radiance Fields with Global-Local Depth Normalization
Jiahe Li, Jiawei Zhang, Xiao Bai, Jin Zheng, Xin Ning, Jun Zhou, Lin Gu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 20775-20785
Radiance fields have demonstrated impressive performance in synthesizing novel views from sparse input views yet prevailing methods suffer from high training costs and slow inference speed. This paper introduces DNGaussian a depth-regularized framework based on 3D Gaussian radiance fields offering real-time and high-quality few-shot novel view synthesis at low costs. Our motivation stems from the highly efficient representation and surprising quality of the recent 3D Gaussian Splatting despite it will encounter a geometry degradation when input views decrease. In the Gaussian radiance fields we find this degradation in scene geometry primarily lined to the positioning of Gaussian primitives and can be mitigated by depth constraint. Consequently we propose a Hard and Soft Depth Regularization to restore accurate scene geometry under coarse monocular depth supervision while maintaining a fine-grained color appearance. To further refine detailed geometry reshaping we introduce Global-Local Depth Normalization enhancing the focus on small local depth changes. Extensive experiments on LLFF DTU and Blender datasets demonstrate that DNGaussian outperforms state-of-the-art methods achieving comparable or better results with significantly reduced memory cost a 25x reduction in training time and over 3000x faster rendering speed. Code is available at: https://github.com/Fictionarry/DNGaussian

ColorPCR: Color Point Cloud Registration with Multi-Stage Geometric-Color Fusion
Juncheng Mu, Lin Bie, Shaoyi Du, Yue Gao; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 21061-21070
Point cloud registration is still a challenging and open problem. For example when the overlap between two point clouds is extremely low geo-only features may be not sufficient. Therefore it is important to further explore how to utilize color data in this task. Under such circumstances we propose ColorPCR for color point cloud registration with multi-stage geometric-color fusion. We design a Hierarchical Color Enhanced Feature Extraction module to extract multi-level geometric-color features and a GeoColor Superpoint Matching Module to encode transformation-invariant geo-color global context for robust patch correspondences. In this way both geometric and color data can be used thus lead to robust performance even under extremely challenging scenarios such as low overlap between two point clouds. To evaluate the performance of our method we colorize 3DMatch/3DLoMatch datasets as Color3DMatch/Color3DLoMatch and evaluations on these datasets demonstrate the effectiveness of our proposed method. Our method achieves state-of-the-art registration recall of 97.5%/88.9% on them.
****
HomoFormer: Homogenized Transformer for Image Shadow Removal
Jie Xiao, Xueyang Fu, Yurui Zhu, Dong Li, Jie Huang, Kai Zhu, Zheng-Jun Zha; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 25617-25626
The spatial non-uniformity and diverse patterns of shadow degradation conflict w

ith the weight sharing manner of dominant models which may lead to an unsatisfac
tory compromise. To tackle with this issue we present a novel strategy from the
view of shadow transformation in this paper: directly homogenizing the spatial d
istribution of shadow degradation. Our key design is the random shuffle operatio
n and its corresponding inverse operation. Specifically random shuffle operation
 stochastically rearranges the pixels across spatial space and the inverse opera
tion recovers the original order. After randomly shuffling the shadow diffuses i
n the whole image and the degradation appears in a homogenized way which can be
effectively processed by the local self-attention layer. Moreover we further dev
ise a new feed forward network with position modeling to exploit image structura
l information. Based on these elements we construct the final local window based
 transformer named HomoFormer for image shadow removal. Our HomoFormer can enjoy
 the linear complexity of local transformers while bypassing challenges of non-u
niformity and diversity of shadow. Extensive experiments are conducted to verify
 the superiority of our HomoFormer across public datasets.

What Do You See in Vehicle? Comprehensive Vision Solution for In-Vehicle Gaze Es
timation
Yihua Cheng, Yaning Zhu, Zongji Wang, Hongquan Hao, Yongwei Liu, Shiqing Cheng,
Xi Wang, Hyung Jin Chang; Proceedings of the IEEE/CVF Conference on Computer Vis
ion and Pattern Recognition (CVPR), 2024, pp. 1556-1565
Driver's eye gaze holds a wealth of cognitive and intentional cues crucial for i
ntelligent vehicles. Despite its significance research on in-vehicle gaze estima
tion remains limited due to the scarcity of comprehensive and well-annotated dat
asets in real driving scenarios. In this paper we present three novel elements t
o advance in-vehicle gaze research. Firstly we introduce IVGaze a pioneering dat
aset capturing in-vehicle gaze collected from 125 individuals and covering a lar
ge range of gaze and head within vehicles. Conventional gaze collection systems
are inadequate for in-vehicle use. In this dataset we propose a new vision-based
 solution for in-vehicle gaze collection introducing a refined gaze target calib
ration method to tackle annotation challenges. Second our research focuses on in
-vehicle gaze estimation leveraging the IVGaze. Images of in-vehicle faces often
 suffer from low resolution prompting our introduction of a gaze pyramid transfo
rmer that harnesses transformer-based multilevel features integration. Expanding
 upon this we introduce the dual-stream gaze pyramid transformer (GazeDPTR). Emp
loying perspective transformation we rotate virtual cameras to normalize images
utilizing camera pose to merge normalized and original images for accurate gaze
estimation. GazeDPTR showcases state-of-the-art performance on the IVGaze datase

t. Thirdly we explore a novel strategy for gaze zone classification by extending the GazeDPTR. A foundational tri-plane and project gaze onto these planes are newly defined. Leveraging both positional features from the projection points and visual attributes from images we achieve superior performance compared to relying solely on visual features thereby substantiating the advantage of gaze estimation. The project is available at https://yihua.zone/work/ivgaze

Driving Everywhere with Large Language Model Policy Adaptation
Boyi Li, Yue Wang, Jiageng Mao, Boris Ivanovic, Sushant Veer, Karen Leung, Marco Pavone; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 14948-14957
Adapting driving behavior to new environments customs and laws is a long-standing problem in autonomous driving precluding the widespread deployment of autonomous vehicles (AVs). In this paper we present LLaDA a simple yet powerful tool that enables human drivers and autonomous vehicles alike to drive everywhere by adapting their tasks and motion plans to traffic rules in new locations. LLaDA achieves this by leveraging the impressive zero-shot generalizability of large language models (LLMs) in interpreting the traffic rules in the local driver handbook. Through an extensive user study we show that LLaDA's instructions are useful in disambiguating in-the-wild unexpected situations. We also demonstrate LLaDA's ability to adapt AV motion planning policies in real-world datasets; LLaDA outperforms baseline planning approaches on all our metrics. Please check our website for more details: https://boyiliee.github.io/llada.

UFORecon: Generalizable Sparse-View Surface Reconstruction from Arbitrary and Unfavorable Sets
Youngju Na, Woo Jae Kim, Kyu Beom Han, Suhyeon Ha, Sung-Eui Yoon; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 5094-5104
Generalizable neural implicit surface reconstruction aims to obtain an accurate underlying geometry given a limited number of multi-view images from unseen scenes. However existing methods select only informative and relevant views using predefined scores for training and testing phases. This constraint renders the model impractical in real-world scenarios where the availability of favorable combinations cannot always be ensured. We introduce and validate a view-combination score to indicate the effectiveness of the input view combination. We observe that previous methods output degenerate solutions under arbitrary and unfavorable sets. Building upon this finding we propose UFORecon a robust view-combination generalizable surface reconstruction framework. To achieve this we apply cross-view matching transformers to model interactions between source images and build correlation frustums to capture global correlations. Additionally we explicitly encode pairwise feature similarities as view-consistent priors. Our proposed framework significantly outperforms previous methods in terms of view-combination generalizability and also in the conventional generalizable protocol trained with favorable view-combinations. The code is available at https://github.com/Youngju-Na/UFORecon.

FAR: Flexible Accurate and Robust 6DoF Relative Camera Pose Estimation
Chris Rockwell, Nilesh Kulkarni, Linyi Jin, Jeong Joon Park, Justin Johnson, David F. Fouhey; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 19854-19864
Estimating relative camera poses between images has been a central problem in computer vision. Methods that find correspondences and solve for the fundamental matrix offer high precision in most cases. Conversely methods predicting pose directly using neural networks are more robust to limited overlap and can infer absolute translation scale but at the expense of reduced precision. We show how to combine the best of both methods; our approach yields results that are both precise and robust while also accurately inferring translation scales. At the heart of our model lies a Transformer that (1) learns to balance between solved and learned pose estimations and (2) provides a prior to guide a solver. A comprehensi

ve analysis supports our design choices and demonstrates that our method adapts flexibly to various feature extractors and correspondence estimators showing state-of-the-art performance in 6DoF pose estimation on Matterport3D InteriorNet StreetLearn and Map-free Relocalization.

eTraM: Event-based Traffic Monitoring Dataset
Aayush Atul Verma, Bharatesh Chakravarthi, Arpitsinh Vaghela, Hua Wei, Yezhou Yang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 22637-22646
Event cameras with their high temporal and dynamic range and minimal memory usage have found applications in various fields. However their potential in static traffic monitoring remains largely unexplored. To facilitate this exploration we present eTraM - a first-of-its-kind fully event-based traffic monitoring dataset. eTraM offers 10 hr of data from different traffic scenarios in various lighting and weather conditions providing a comprehensive overview of real-world situations. Providing 2M bounding box annotations it covers eight distinct classes of traffic participants ranging from vehicles to pedestrians and micro-mobility. eTraM's utility has been assessed using state-of-the-art methods for traffic participant detection including RVT RED and YOLOv8. We quantitatively evaluate the ability of event-based models to generalize on nighttime and unseen scenes. Our findings substantiate the compelling potential of leveraging event cameras for traffic monitoring opening new avenues for research and application. eTraM is available at https://eventbasedvision.github.io/eTraM.

MoCha-Stereo: Motif Channel Attention Network for Stereo Matching
Ziyang Chen, Wei Long, He Yao, Yongjun Zhang, Bingshu Wang, Yongbin Qin, Jia Wu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 27768-27777
Learning-based stereo matching techniques have made significant progress. However existing methods inevitably lose geometrical structure information during the feature channel generation process resulting in edge detail mismatches. In this paper the Motif Channel Attention Stereo Matching Network (MoCha-Stereo) is designed to address this problem. We provide the Motif Channel Correlation Volume (MCCV) to determine more accurate edge matching costs. MCCV is achieved by projecting motif channels which capture common geometric structures in feature channels onto feature maps and cost volumes. In addition edge variations in the reconstruction error map also affect details matching we propose the Reconstruction Error Motif Penalty (REMP) module to further refine the full-resolution disparity estimation. REMP integrates the frequency information of typical channel features from the reconstruction error. MoCha-Stereo ranks 1st on the KITTI-2015 and KITTI-2012 Reflective leaderboards. Our structure also shows excellent performance in Multi-View Stereo. Code is avaliable at https://github.com/ZYangChen/MoCha-Stereo.

Koala: Key Frame-Conditioned Long Video-LLM
Reuben Tan, Ximeng Sun, Ping Hu, Jui-hsien Wang, Hanieh Deilamsalehy, Bryan A. Plummer, Bryan Russell, Kate Saenko; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 13581-13591
Long video question answering is a challenging task that involves recognizing short-term activities and reasoning about their fine-grained relationships. State-of-the-art video Large Language Models (vLLMs) hold promise as a viable solution due to their demonstrated emergent capabilities on new tasks. However despite being trained on millions of short seconds-long videos vLLMs are unable to understand minutes-long videos and accurately answer questions about them. To address this limitation we propose a lightweight and self-supervised approach Key frame-conditioned long video-LLM (Koala) that introduces learnable spatiotemporal queries to adapt pretrained vLLMs for generalizing to longer videos. Our approach introduces two new tokenizers that condition on visual tokens computed from sparse video key frames for understanding short and long video moments. We train our proposed approach on HowTo100M and demonstrate its effectiveness on zero-shot lon

g video understanding benchmarks where it outperforms state-of-the-art large mod els by 3 - 6% in absolute accuracy across all tasks. Surprisingly we also empiri cally show that our approach not only helps a pretrained vLLM to understand long videos but also improves its accuracy on short-term action recognition.

Extend Your Own Correspondences: Unsupervised Distant Point Cloud Registration b y Progressive Distance Extension
Quan Liu, Hongzi Zhu, Zhenxi Wang, Yunsong Zhou, Shan Chang, Minyi Guo; Proceedi ngs of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR) , 2024, pp. 20816-20826
Registration of point clouds collected from a pair of distant vehicles provides a comprehensive and accurate 3D view of the driving scenario which is vital for driving safety related applications yet existing literature suffers from the exp ensive pose label acquisition and the deficiency to generalize to new data distr ibutions. In this paper we propose EYOC an unsupervised distant point cloud regi stration method that adapts to new point cloud distributions on the fly requirin g no global pose labels. The core idea of EYOC is to train a feature extractor i n a progressive fashion where in each round the feature extractor trained with n ear point cloud pairs can label slightly farther point cloud pairs enabling self -supervision on such far point cloud pairs. This process continues until the der ived extractor can be used to register distant point clouds. Particularly to ena ble high-fidelity correspondence label generation we devise an effective spatial filtering scheme to select the most representative correspondences to register a point cloud pair and then utilize the aligned point clouds to discover more co rrect correspondences. Experiments show that EYOC can achieve comparable perform ance with state-of-the-art supervised methods at a lower training cost. Moreover it outwits supervised methods regarding generalization performance on new data distributions.

HallusionBench: An Advanced Diagnostic Suite for Entangled Language Hallucinatio n and Visual Illusion in Large Vision-Language Models
Tianrui Guan, Fuxiao Liu, Xiyang Wu, Ruiqi Xian, Zongxia Li, Xiaoyu Liu, Xijun W ang, Lichang Chen, Furong Huang, Yaser Yacoob, Dinesh Manocha, Tianyi Zhou; Proc eedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (C VPR), 2024, pp. 14375-14385
We introduce "HallusionBench" a comprehensive benchmark designed for the evaluat ion of image-context reasoning. This benchmark presents significant challenges t o advanced large visual-language models (LVLMs) such as GPT-4V(ision) Gemini Pro Vision Claude 3 and LLaVA-1.5 by emphasizing nuanced understanding and interpre tation of visual data. The benchmark comprises 346 images paired with 1129 quest ions all meticulously crafted by human experts. We introduce a novel structure f or these visual questions designed to establish control groups. This structure e nables us to conduct a quantitative analysis of the models' response tendencies logical consistency and various failure modes. In our evaluation on HallusionBen ch we benchmarked 15 different models highlighting a 31.42% question-pair accura cy achieved by the state-of-the-art GPT-4V. Notably all other evaluated models a chieve accuracy below 16%. Moreover our analysis not only highlights the observe d failure modes including language hallucination and visual illusion but also de epens an under standing of these pitfalls. Our comprehensive case studies within HallusionBench shed light on the challenges of hallucination and illusion in LV LMs. Based on these insights we suggest potential pathways for their future impr ovement. The benchmark and codebase can be accessed at https://github.com/tianyi lab/HallusionBench.

ID-like Prompt Learning for Few-Shot Out-of-Distribution Detection
Yichen Bai, Zongbo Han, Bing Cao, Xiaoheng Jiang, Qinghua Hu, Changqing Zhang; P roceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 17480-17489
Out-of-distribution (OOD) detection methods often exploit auxiliary outliers to train model identifying OOD samples especially discovering challenging outliers

from auxiliary outliers dataset to improve OOD detection. However they may still face limitations in effectively distinguishing between the most challenging OOD samples that are much like in-distribution (ID) data i.e. ID-like samples. To this end we propose a novel OOD detection framework that discovers ID-like outliers using CLIP from the vicinity space of the ID samples thus helping to identify these most challenging OOD samples. Then a prompt learning framework is proposed that utilizes the identified ID-like outliers to further leverage the capabilities of CLIP for OOD detection. Benefiting from the powerful CLIP we only need a small number of ID samples to learn the prompts of the model without exposing other auxiliary outlier datasets. By focusing on the most challenging ID-like OOD samples and elegantly exploiting the capabilities of CLIP our method achieves superior few-shot learning performance on various real-world image datasets (e.g. in 4-shot OOD detection on the ImageNet-1k dataset our method reduces the average FPR95 by 12.16% and improves the average AUROC by 2.76% compared to state-of-the-art methods).

Breathing Life Into Sketches Using Text-to-Video Priors
Rinon Gal, Yael Vinker, Yuval Alaluf, Amit Bermano, Daniel Cohen-Or, Ariel Shamir, Gal Chechik; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 4325-4336
A sketch is one of the most intuitive and versatile tools humans use to convey their ideas visually. An animated sketch opens another dimension to the expression of ideas and is widely used by designers for a variety of purposes. Animating sketches is a laborious process requiring extensive experience and professional design skills. In this work we present a method that automatically adds motion to a single-subject sketch (hence "breathing life into it") merely by providing a text prompt indicating the desired motion. The output is a short animation provided in vector representation which can be easily edited. Our method does not require extensive training but instead leverages the motion prior of a large pretrained text-to-video diffusion model using a score-distillation loss to guide the placement of strokes. To promote natural and smooth motion and to better preserve the sketch's appearance we model the learned motion through two components. The first governs small local deformations and the second controls global affine transformations. Surprisingly we find that even models that struggle to generate sketch videos on their own can still serve as a useful backbone for animating abstract representations.
****
Multi-modal Learning for Geospatial Vegetation Forecasting
Vitus Benson, Claire Robin, Christian Requena-Mesa, Lazaro Alonso, Nuno Carvalhais, José Cortés, Zhihan Gao, Nora Linscheid, Mélanie Weynants, Markus Reichstein; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 27788-27799
Precise geospatial vegetation forecasting holds potential across diverse sectors including agriculture forestry humanitarian aid and carbon accounting. To leverage the vast availability of satellite imagery for this task various works have applied deep neural networks for predicting multispectral images in photorealistic quality. However the important area of vegetation dynamics has not been thoroughly explored. Our study introduces GreenEarthNet the first dataset specifically designed for high-resolution vegetation forecasting and Contextformer a novel deep learning approach for predicting vegetation greenness from Sentinel 2 satellite images with fine resolution across Europe. Our multi-modal transformer model Contextformer leverages spatial context through a vision backbone and predicts the temporal dynamics on local context patches incorporating meteorological time series in a parameter-efficient manner. The GreenEarthNet dataset features a learned cloud mask and an appropriate evaluation scheme for vegetation modeling. It also maintains compatibility with the existing satellite imagery forecasting dataset EarthNet2021 enabling cross-dataset model comparisons. Our extensive qualitative and quantitative analyses reveal that our methods outperform a broad range of baseline techniques. This includes surpassing previous state-of-the-art models on EarthNet2021 as well as adapted models from time series forecasting and

video prediction. To the best of our knowledge this work presents the first mod
els for continental-scale vegetation modeling at fine resolution able to capture
 anomalies beyond the seasonal cycle thereby paving the way for predicting veget
ation health and behaviour in response to climate variability and extremes. We p
rovide open source code and pre-trained weights to reproduce our experimental re
sults under https://github.com/vitusbenson/greenearthnet.

Learning Diffusion Texture Priors for Image Restoration
Tian Ye, Sixiang Chen, Wenhao Chai, Zhaohu Xing, Jing Qin, Ge Lin, Lei Zhu; Proc
eedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (C
VPR), 2024, pp. 2524-2534
Diffusion Models have shown remarkable performance in image generation tasks whi
ch are capable of generating diverse and realistic image content. When adopting
diffusion models for image restoration the crucial challenge lies in how to pres
erve high-level image fidelity in the randomness diffusion process and generate
accurate background structures and realistic texture details. In this paper we p
ropose a general framework and develop a Diffusion Texture Prior Model (DTPM) fo
r image restoration tasks. DTPM explicitly models high-quality texture details t
hrough the diffusion process rather than global contextual content. In phase one
 of the training stage we pre-train DTPM on approximately 55K high-quality image
 samples after which we freeze most of its parameters. In phase two we insert co
nditional guidance adapters into DTPM and equip it with an initial predictor the
reby facilitating its rapid adaptation to downstream image restoration tasks. Ou
r DTPM could mitigate the randomness of traditional diffusion models by utilizin
g encapsulated rich and diverse texture knowledge and background structural info
rmation provided by the initial predictor during the sampling process. Our compr
ehensive evaluations of five image restoration tasks demonstrate DTPM's superior
ity over existing regression and diffusion-based image restoration methods in pe
rceptual quality and its exceptional generalization capabilities.

Bring Event into RGB and LiDAR: Hierarchical Visual-Motion Fusion for Scene Flow
Hanyu Zhou, Yi Chang, Zhiwei Shi; Proceedings of the IEEE/CVF Conference on Comp
uter Vision and Pattern Recognition (CVPR), 2024, pp. 26477-26486
Single RGB or LiDAR is the mainstream sensor for the challenging scene flow whic
h relies heavily on visual features to match motion features. Compared with sing
le modality existing methods adopt a fusion strategy to directly fuse the cross-
modal complementary knowledge in motion space. However these direct fusion metho
ds may suffer the modality gap due to the visual intrinsic heterogeneous nature
between RGB and LiDAR thus deteriorating motion features. We discover that event
 has the homogeneous nature with RGB and LiDAR in both visual and motion spaces.
 In this work we bring the event as a bridge between RGB and LiDAR and propose a
 novel hierarchical visual-motion fusion framework for scene flow which explores
 a homogeneous space to fuse the cross-modal complementary knowledge for physica
l interpretation. In visual fusion we discover that event has a complementarity
(relative v.s. absolute) in luminance space with RGB for high dynamic imaging an
d has a complementarity (local boundary v.s. global shape) in scene structure sp
ace with LiDAR for structure integrity. In motion fusion we figure out that RGB
event and LiDAR are complementary (spatial-dense temporal-dense v.s. spatiotempo
ral-sparse) to each other in correlation space which motivates us to fuse their
motion correlations for motion continuity. The proposed hierarchical fusion can
explicitly fuse the multimodal knowledge to progressively improve scene flow fro
m visual space to motion space. Extensive experiments have been performed to ver
ify the superiority of the proposed method.

Entangled View-Epipolar Information Aggregation for Generalizable Neural Radianc
e Fields
Zhiyuan Min, Yawei Luo, Wei Yang, Yuesong Wang, Yi Yang; Proceedings of the IEEE
/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 490
6-4916
Generalizable NeRF can directly synthesize novel views across new scenes elimina

ting the need for scene-specific retraining in vanilla NeRF. A critical enabling factor in these approaches is the extraction of a generalizable 3D representation by aggregating source-view features. In this paper we propose an Entangled View-Epipolar Information Aggregation method dubbed EVE-NeRF. Different from existing methods that consider cross-view and along-epipolar information independently EVE-NeRF conducts the view-epipolar feature aggregation in an entangled manner by injecting the scene-invariant appearance continuity and geometry consistency priors to the aggregation process. Our approach effectively mitigates the potential lack of inherent geometric and appearance constraint resulting from one-dimensional interactions thus further boosting the 3D representation generalizablity. EVE-NeRF attains state-of-the-art performance across various evaluation scenarios. Extensive experiments demonstate that compared to prevailing single-dimensional aggregation the entangled network excels in the accuracy of 3D scene geometry and appearance reconstruction. Our code is publicly available at https://github.com/tatakai1/EVENeRF.

Jack of All Tasks Master of Many: Designing General-Purpose Coarse-to-Fine Vision-Language Model
Shraman Pramanick, Guangxing Han, Rui Hou, Sayan Nag, Ser-Nam Lim, Nicolas Ballas, Qifan Wang, Rama Chellappa, Amjad Almahairi; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 14076-14088
The ability of large language models (LLMs) to process visual inputs has given rise to general-purpose vision systems unifying various vision-language (VL) tasks by instruction tuning. However due to the enormous diversity in input-output formats in the vision domain existing general-purpose models fail to successfully integrate segmentation and multi-image inputs with coarse-level tasks into a single framework. In this work we introduce VistaLLM a powerful visual system that addresses coarse- and fine grained VL tasks over single and multiple input images using a unified framework. VistaLLM utilizes an instruction-guided image tokenizer that filters global embeddings using task descriptions to extract compressed and refined features from numerous images. Moreover VistaLLM employs a gradient-aware adaptive sampling technique to represent binary segmentation masks as sequences significantly improving over previously used uniform sampling. To bolster the desired capability of VistaLLM we curate CoinIt a comprehensive coarse-to-fine instruction tuning dataset with 6.8M samples. We also address the lack of multi-image grounding datasets by introducing a novel task AttCoSeg (Attribute-level Co Segmentation) which boosts the model's reasoning and grounding capability over multiple input images. Extensive experiments on a wide range of V- and VL tasks demonstrate the effectiveness of VistaLLM by achieving consistent state-of-the-art performance over strong baselines across many downstream tasks. Our project page can be found at https://shramanpramanick.github.io/VistaLLM/
****
MMVP: A Multimodal MoCap Dataset with Vision and Pressure Sensors
He Zhang, Shenghao Ren, Haolei Yuan, Jianhui Zhao, Fan Li, Shuangpeng Sun, Zhenghao Liang, Tao Yu, Qiu Shen, Xun Cao; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 21842-21852
Foot contact is an important cue for human motion capture understanding and generation. Existing datasets tend to annotate dense foot contact using visual matching with thresholding or incorporating pressure signals. However these approaches either suffer from low accuracy or are only designed for small-range and slow motion. There is still a lack of a vision-pressure multimodal dataset with large-range and fast human motion as well as accurate and dense foot-contact annotation. To fill this gap we propose a Multimodal MoCap Dataset with Vision and Pressure sensors named MMVP. MMVP provides accurate and dense plantar pressure signals synchronized with RGBD observations which is especially useful for both plausible shape estimation robust pose fitting without foot drifting and accurate global translation tracking. To validate the dataset we propose an RGBD-P SMPL fitting method and also a monocular-video-based baseline framework VP-MoCap for human motion capture. Experiments demonstrate that our RGBD-P SMPL Fitting results significantly outperform pure visual motion capture. Moreover VP-MoCap outperforms

SOTA methods in foot-contact and global translation estimation accuracy. We bel ieve the configuration of the dataset and the baseline frameworks will stimulate the research in this direction and also provide a good reference for MoCap appl ications in various domains. Project page: https://metaverse-ai-lab-thu.github.i o/MMVP-Dataset/.

YolOOD: Utilizing Object Detection Concepts for Multi-Label Out-of-Distribution Detection
Alon Zolfi, Guy Amit, Amit Baras, Satoru Koda, Ikuya Morikawa, Yuval Elovici, As af Shabtai; Proceedings of the IEEE/CVF Conference on Computer Vision and Patter n Recognition (CVPR), 2024, pp. 5788-5797
Out-of-distribution (OOD) detection has attracted a large amount of attention fr om the machine learning research community in recent years due to its importance in deployed systems. Most of the previous studies focused on the detection of O OD samples in the multi-class classification task. However OOD detection in the multi-label classification task a more common real-world use case remains an und erexplored domain. In this research we propose YolOOD - a method that utilizes c oncepts from the object detection domain to perform OOD detection in the multi-l abel classification task. Object detection models have an inherent ability to di stinguish between objects of interest (in-distribution data) and irrelevant obje cts (OOD data) in images that contain multiple objects belonging to different cl ass categories. These abilities allow us to convert a regular object detection m odel into an image classifier with inherent OOD detection capabilities with just minor changes. We compare our approach to state-of-the-art OOD detection method s and demonstrate YolOOD's ability to outperform these methods on a comprehensiv e suite of in-distribution and OOD benchmark datasets.

SchurVINS: Schur Complement-Based Lightweight Visual Inertial Navigation System
Yunfei Fan, Tianyu Zhao, Guidong Wang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 17964-17973
Accuracy and computational efficiency are the most important metrics to Visual I nertial Navigation System (VINS). The existing VINS algorithms with either high accuracy or low computational complexity are difficult to provide the high preci sion localization in resource-constrained devices. To this end we propose a nove l filter-based VINS framework named SchurVINS (SV) which could guarantee both hi gh accuracy by building a complete residual model and low computational complexi ty with Schur complement. Technically we first formulate the full residual model where Gradient Hessian and observation covariance are explicitly modeled. Then Schur complement is employed to decompose the full model into ego-motion residua l model and landmark residual model. Finally Extended Kalman Filter (EKF) update is implemented in these two models with high efficiency. Experiments on EuRoC a nd TUM-VI datasets show that our method notably outperforms state-of-the-art (SO TA) methods in both accuracy and computational complexity. The experimental code of SchurVINS is available at https://github.com/bytedance/SchurVINS.

Collaborating Foundation Models for Domain Generalized Semantic Segmentation
Yasser Benigmim, Subhankar Roy, Slim Essid, Vicky Kalogeiton, Stéphane Lathuiliè re; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recogn ition (CVPR), 2024, pp. 3108-3119
Domain Generalized Semantic Segmentation (DGSS) deals with training a model on a labeled source domain with the aim of generalizing to unseen domains during inf erence. Existing DGSS methods typically effectuate robust features by means of D omain Randomization (DR). Such an approach is often limited as it can only accou nt for style diversification and not content. In this work we take an orthogonal approach to DGSS and propose to use an assembly of CoLlaborative FOUndation mod els for Domain Generalized Semantic Segmentation (CLOUDS). In detail CLOUDS is a framework that integrates Foundation Models of various kinds: (i) CLIP backbone for its robust feature representation (ii) Diffusion Model to diversify the con tent thereby covering various modes of the possible target distribution and (iii) Segment Anything Model (SAM) for iteratively refining the predictions of the s

egmentation model. Extensive experiments show that our CLOUDS excels in adapting from synthetic to real DGSS benchmarks and under varying weather conditions notably outperforming prior methods by 5.6% and 6.7% on averaged mIoU respectively. Our code is available at https://github.com/yasserben/CLOUDS

Towards Variable and Coordinated Holistic Co-Speech Motion Generation
Yifei Liu, Qiong Cao, Yandong Wen, Huaiguang Jiang, Changxing Ding; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 1566-1576
This paper addresses the problem of generating lifelike holistic co-speech motions for 3D avatars focusing on two key aspects: variability and coordination. Variability allows the avatar to exhibit a wide range of motions even with similar speech content while coordination ensures a harmonious alignment among facial expressions hand gestures and body poses. We aim to achieve both with ProbTalk a unified probabilistic framework designed to jointly model facial hand and body movements in speech. ProbTalk builds on the variational autoencoder (VAE) architecture and incorporates three core designs. First we introduce product quantization (PQ) to the VAE which enriches the representation of complex holistic motion. Second we devise a novel non-autoregressive model that embeds 2D positional encoding into the product-quantized representation thereby preserving essential structure information of the PQ codes. Last we employ a secondary stage to refine the preliminary prediction further sharpening the high-frequency details. Coupling these three designs enables ProbTalk to generate natural and diverse holistic co-speech motions outperforming several state-of-the-art methods in qualitative and quantitative evaluations particularly in terms of realism. Our code and model will be released for research purposes at https://feifeifeiliu.github.io/probtalk/.

JoAPR: Cleaning the Lens of Prompt Learning for Vision-Language Models
Yuncheng Guo, Xiaodong Gu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 28695-28705
Leveraging few-shot datasets in prompt learning for Vision-Language Models eliminates the need for manual prompt engineering while highlighting the necessity of accurate annotations for the labels. However high-level or complex label noise challenges prompt learning for Vision-Language Models. Aiming at this issue we propose a new framework for improving its robustness. Specifically we introduce the Joint Adaptive Partitioning for Label Refurbishment (JoAPR) a structured framework encompassing two key steps. 1) Data Partitioning where we differentiate between clean and noisy data using joint adaptive thresholds. 2) Label Refurbishment where we correct the labels based on the partition outcomes before retraining the network. Our comprehensive experiments confirm that JoAPR substantially enhances the robustness of prompt learning for Vision-Language Models against label noise offering a promising direction for future research.

AllSpark: Reborn Labeled Features from Unlabeled in Transformer for Semi-Supervised Semantic Segmentation
Haonan Wang, Qixiang Zhang, Yi Li, Xiaomeng Li; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 3627-3636
Semi-supervised semantic segmentation (SSSS) has been proposed to alleviate the burden of time-consuming pixel-level manual labeling which leverages limited labeled data along with larger amounts of unlabeled data. Current state-of-the-art methods train the labeled data with ground truths and unlabeled data with pseudo labels. However the two training flows are separate which allows labeled data to dominate the training process resulting in low-quality pseudo labels and consequently sub-optimal results. To alleviate this issue we present AllSpark which reborns the labeled features from unlabeled ones with the channel-wise cross-attention mechanism. We further introduce a Semantic Memory along with a Channel Semantic Grouping strategy to ensure that unlabeled features adequately represent labeled features. The AllSpark shed new light on the architecture level designs of SSSS rather than framework level which avoids increasingly complicated trainin

g pipeline designs. It can also be regarded as a flexible bottleneck module that
 can be seamlessly integrated into a general transformer-based segmentation mode
l. The proposed AllSpark outperforms existing methods across all evaluation prot
ocols on Pascal Cityscapes and COCO benchmarks without bells-and-whistles. Code
and model weights are available at: https://github.com/xmed-lab/AllSpark.

SIGNeRF: Scene Integrated Generation for Neural Radiance Fields
Jan-Niklas Dihlmann, Andreas Engelhardt, Hendrik Lensch; Proceedings of the IEEE
/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 667
9-6688
Advances in image diffusion models have recently led to notable improvements in
the generation of high-quality images. In combination with Neural Radiance Field
s (NeRFs) they enabled new opportunities in 3D generation. However most generati
ve 3D approaches are object-centric and applying them to editing existing photor
ealistic scenes is not trivial. We propose SIGNeRF a novel approach for fast and
 controllable NeRF scene editing and scene-integrated object generation. A new g
enerative update strategy ensures 3D consistency across the edited images withou
t requiring iterative optimization. We find that depth-conditioned diffusion mod
els inherently possess the capability to generate 3D consistent views by request
ing a grid of images instead of single views. Based on these insights we introdu
ce a multi-view reference sheet of modified images. Our method updates an image
collection consistently based on the reference sheet and refines the original Ne
RF with the newly generated image set in one go. By exploiting the depth conditi
oning mechanism of the image diffusion model we gain fine control over the spati
al location of the edit and enforce shape guidance by a selected region or an ex
ternal mesh.

ViP-LLaVA: Making Large Multimodal Models Understand Arbitrary Visual Prompts
Mu Cai, Haotian Liu, Siva Karthik Mustikovela, Gregory P. Meyer, Yuning Chai, De
nnis Park, Yong Jae Lee; Proceedings of the IEEE/CVF Conference on Computer Visi
on and Pattern Recognition (CVPR), 2024, pp. 12914-12923
While existing large vision-language multimodal models focus on whole image unde
rstanding there is a prominent gap in achieving region-specific comprehension. C
urrent approaches that use textual coordinates or spatial encodings often fail t
o provide a user-friendly interface for visual prompting. To address this challe
nge we introduce a novel multimodal model capable of decoding arbitrary (free-fo
rm) visual prompts. This allows users to intuitively mark images and interact wi
th the model using natural cues like a "red bounding box" or "pointed arrow'". O
ur simple design directly overlays visual markers onto the RGB image eliminating
 the need for complex region encodings yet achieves state-of-the-art performance
 on region-understanding tasks like Visual7W PointQA and Visual Commonsense Reas
oning benchmark. Furthermore we present ViP-Bench a comprehensive benchmark to a
ssess the capability of models in understanding visual prompts across multiple d
imensions enabling future research in this domain. Code data and model are publi
cly available.

OVER-NAV: Elevating Iterative Vision-and-Language Navigation with Open-Vocabular
y Detection and StructurEd Representation
Ganlong Zhao, Guanbin Li, Weikai Chen, Yizhou Yu; Proceedings of the IEEE/CVF Co
nference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 16296-1630
6
Recent advances in Iterative Vision-and-Language Navigation(IVLN) introduce a mo
re meaningful and practical paradigm of VLN by maintaining the agent's memory ac
ross tours of scenes. Although the long-term memory aligns better with the persi
stent nature of the VLN task it poses more challenges on how to utilize the high
ly unstructured navigation memory with extremely sparse supervision. Towards thi
s end we propose OVER-NAV which aims to go over and beyond the current arts of I
VLN techniques. In particular we propose to incorporate LLMs and open-vocabulary
 detectors to distill key information and establish correspondence between multi
-modal signals. Such a mechanism introduces reliable cross-modal supervision and
 enables on-the-fly generalization to unseen scenes without the need of extra an
notation and re-training. To fully exploit the interpreted navigation data we fu
rther introduce a structured representation coded Omnigraph to effectively integ
rate multi-modal information along the tour. Accompanied with a novel omnigraph
fusion mechanism OVER-NAV is able to extract the most relevant knowledge from om
nigraph for a more accurate navigating action. In addition OVER-NAV seamlessly s
upports both discrete and continuous environments under a unified framework. We
demonstrate the superiority of OVER-NAV in extensive experiments.

1-Lipschitz Layers Compared: Memory Speed and Certifiable Robustness
Bernd Prach, Fabio Brau, Giorgio Buttazzo, Christoph H. Lampert; Proceedings of
the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024,
 pp. 24574-24583
The robustness of neural networks against input perturbations with bounded magni
tude represents a serious concern in the deployment of deep learning models in s
afety-critical systems. Recently the scientific community has focused on enhanci
ng certifiable robustness guarantees by crafting \ols neural networks that lever
age Lipschitz bounded dense and convolutional layers. Different methods have bee
n proposed in the literature to achieve this goal however comparing the performa
nce of such methods is not straightforward since different metrics can be releva
nt (e.g. training time memory usage accuracy certifiable robustness) for differe
nt applications. Therefore this work provides a thorough comparison between diff
erent methods covering theoretical aspects such as computational complexity and
memory requirements as well as empirical measurements of time per epoch required
 memory accuracy and certifiable robust accuracy. The paper also provides some g
uidelines and recommendations to support the user in selecting the methods that
work best depending on the available resources. We provide code at github.com/be
rndprach/1LipschitzLayersCompared

All Rivers Run to the Sea: Private Learning with Asymmetric Flows
Yue Niu, Ramy E. Ali, Saurav Prakash, Salman Avestimehr; Proceedings of the IEEE
/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 123
53-12362
Data privacy is of great concern in cloud machine-learning service platforms whe
n sensitive data are exposed to service providers. While private computing envir
onments (e.g. secure enclaves) and cryptographic approaches (e.g. homomorphic en
cryption) provide strong privacy protection their computing performance still fa
lls short compared to cloud GPUs. To achieve privacy protection with high comput
ing performance we propose Delta a new private training and inference framework
with comparable model performance as non-private centralized training. Delta fea
tures two asymmetric data flows: the main information-sensitive flow and the res
idual flow. The main part flows into a small model while the residuals are offlo
aded to a large model. Specifically Delta embeds the information-sensitive repre
sentations into a low-dimensional space while pushing the information-insensitiv
e part into high-dimension residuals. To ensure privacy protection the low-dimen

sional information-sensitive part is secured and fed to a small model in a priva
te environment. On the other hand the residual part is sent to fast cloud GPUs a
nd processed by a large model. To further enhance privacy and reduce the communi
cation cost Delta applies a random binary quantization technique along with a DP
-based technique to the residuals before sharing them with the public platform.
We theoretically show that Delta guarantees differential privacy in the public e
nvironment and greatly reduces the complexity in the private environment. We con
duct empirical analyses on CIFAR-10 CIFAR-100 and ImageNet datasets and ResNet-1
8 and ResNet-34 showing that Delta achieves strong privacy protection fast train
ing and inference without significantly compromising the model utility.

Generating Illustrated Instructions
Sachit Menon, Ishan Misra, Rohit Girdhar; Proceedings of the IEEE/CVF Conference
 on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 6274-6284
We introduce a new task of generating "Illustrated Instructions" i.e. visual ins
tructions customized to a user's needs. We identify desiderata unique to this ta
sk and formalize it through a suite of automatic and human evaluation metrics de
signed to measure the validity consistency and efficacy of the generations. We c
ombine the power of large language models (LLMs) together with strong text-to-im
age generation diffusion models to propose a simple approach called StackedDiffu
sion which generates such illustrated instructions given text as input. The resu
lting model strongly outperforms baseline approaches and state-of-the-art multim
odal LLMs; and in 30% of cases users even prefer it to human-generated articles.
 Most notably it enables various new and exciting applications far beyond what s
tatic articles on the web can provide such as personalized instructions complete
 with intermediate steps and pictures in response to a user's individual situati
on.

Construct to Associate: Cooperative Context Learning for Domain Adaptive Point C
loud Segmentation
Guangrui Li; Proceedings of the IEEE/CVF Conference on Computer Vision and Patte
rn Recognition (CVPR), 2024, pp. 27917-27926
This paper tackles the domain adaptation problem in point cloud semantic segment
ation which performs adaptation from a fully labeled domain (source domain) to a
n unlabeled target domain. Due to the unordered property of point clouds LiDAR s
cans typically show varying geometric structures across different regions in ter
ms of density noises etc hence leading to increased dynamics on context. However
 such characteristics are not consistent across domains due to the difference in
 sensors environments etc thus hampering the effective scene comprehension acros
s domains. To solve this we propose Cooperative Context Learning that performs c
ontext modeling and modulation from different aspects but in a cooperative manne
r. Specifically we first devise context embeddings to discover and model context
ual relationships with close neighbors in a learnable manner. Then with the cont
ext embeddings from two domains we introduce a set of learnable prototypes to at
tend and associate them under the attention paradigm. As a result these prototyp
es naturally establish long-range dependency across regions and domains thereby
encouraging the transfer of context knowledge and easing the adaptation. Moreove
r the attention in turn attunes and guides the local context modeling and urges
them to focus on the domain-invariant context knowledge thus promoting the adapt
ation in a cooperative manner. Experiments on representative benchmarks verify t
hat our method attains the new state-of-the-art.

Robust Image Denoising through Adversarial Frequency Mixup
Donghun Ryou, Inju Ha, Hyewon Yoo, Dongwan Kim, Bohyung Han; Proceedings of the
IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp.
 2723-2732
Image denoising approaches based on deep neural networks often struggle with ove
rfitting to specific noise distributions present in training data. This challeng
e persists in existing real-world denoising networks which are trained using a l
imited spectrum of real noise distributions and thus show poor robustness to out

-of-distribution real noise types. To alleviate this issue we develop a novel tr aining framework called Adversarial Frequency Mixup (AFM). AFM leverages mixup i n the frequency domain to generate noisy images with distinctive and challenging noise characteristics all the while preserving the properties of authentic real -world noise. Subsequently incorporating these noisy images into the training pi peline enhances the denoising network's robustness to variations in noise distri butions. Extensive experiments and analyses conducted on a wide range of real no ise benchmarks demonstrate that denoising networks trained with our proposed fra mework exhibit significant improvements in robustness to unseen noise distributi ons. The code is available at https://github.com/dhryougit/AFM.

HandBooster: Boosting 3D Hand-Mesh Reconstruction by Conditional Synthesis and S ampling of Hand-Object Interactions
Hao Xu, Haipeng Li, Yinqiao Wang, Shuaicheng Liu, Chi-Wing Fu; Proceedings of th e IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, p p. 10159-10169
Reconstructing 3D hand mesh robustly from a single image is very challenging due to the lack of diversity in existing real-world datasets. While data synthesis helps relieve the issue the syn-to-real gap still hinders its usage. In this wor k we present HandBooster a new approach to uplift the data diversity and boost t he 3D hand-mesh reconstruction performance by training a conditional generative space on hand-object interactions and purposely sampling the space to synthesize effective data samples. First we construct versatile content-aware conditions t o guide a diffusion model to produce realistic images with diverse hand appearan ces poses views and backgrounds; favorably accurate 3D annotations are obtained for free. Then we design a novel condition creator based on our similarity-aware distribution sampling strategies to deliberately find novel and realistic inter action poses that are distinctive from the training set. Equipped with our metho d several baselines can be significantly improved beyond the SOTA on the HO3D an d DexYCB benchmarks. Our code will be released on https://github.com/hxwork/Hand Booster_Pytorch.
****
A-Teacher: Asymmetric Network for 3D Semi-Supervised Object Detection
Hanshi Wang, Zhipeng Zhang, Jin Gao, Weiming Hu; Proceedings of the IEEE/CVF Con ference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 14978-14987
This work proposes the first online asymmetric semi-supervised framework namely A-Teacher for LiDAR-based 3D object detection. Our motivation stems from the obs ervation that 1) existing symmetric teacher-student methods for semi-supervised 3D object detection have characterized simplicity but impede the distillation pe rformance between teacher and student because of the demand for an identical mod el structure and input data format. 2) The offline asymmetric methods with a com plex teacher model constructed differently can generate more precise pseudo-labe ls but is challenging to jointly optimize the teacher and student model. Consequ ently in this paper we devise a different path from the conventional paradigm wh ich can harness the capacity of a strong teacher while preserving the advantages of online teacher model updates. The essence is the proposed attention-based re finement model that can be seamlessly integrated into a vanilla teacher. The ref inement model works in the divide-and-conquer manner that respectively handles t hree challenging scenarios including 1) objects detected in the current timestam p but with suboptimal box quality 2) objects are missed in the current timestamp but are detected in past or future frames 3) objects are neglected in all frame s. It is worth noting that even while tackling these complex cases our model ret ains the efficiency of the online teacher-student semi-supervised framework. Exp erimental results on Waymo show that our method outperforms previous state-of-th e-art HSSDA for 4.7 on mAP (L1) while consuming fewer training resources.

GoMVS: Geometrically Consistent Cost Aggregation for Multi-View Stereo
Jiang Wu, Rui Li, Haofei Xu, Wenxun Zhao, Yu Zhu, Jinqiu Sun, Yanning Zhang; Pro ceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 20207-20216

Matching cost aggregation plays a fundamental role in learning-based multi-view stereo networks. However directly aggregating adjacent costs can lead to suboptimal results due to local geometric inconsistency. Related methods either seek selective aggregation or improve aggregated depth in the 2D space both are unable to handle geometric inconsistency in the cost volume effectively. In this paper we propose GoMVS to aggregate geometrically consistent costs yielding better utilization of adjacent geometries. More specifically we correspond and propagate adjacent costs to the reference pixel by leveraging the local geometric smoothness in conjunction with surface normals. We achieve this by the geometric consistent propagation (GCP) module. It computes the correspondence from the adjacent depth hypothesis space to the reference depth space using surface normals then uses the correspondence to propagate adjacent costs to the reference geometry followed by a convolution for aggregation. Our method achieves new state-of-the-art performance on DTU Tanks & Temple and ETH3D datasets. Notably our method ranks 1st on the Tanks & Temple Advanced benchmark. Code is available at https://github.com/Wuuu3511/GoMVS.

Evaluating Transferability in Retrieval Tasks: An Approach Using MMD and Kernel Methods
Mengyu Dai, Amir Hossein Raffiee, Aashish Jain, Joshua Correa; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 22390-22400
Retrieval tasks play central roles in real-world machine learning systems such as search engines recommender systems and retrieval-augmented generation (RAG). Achieving decent performance in these tasks often requires fine-tuning various pre-trained models on specific datasets and selecting the best candidate a process that can be both time and resource-consuming. To tackle the problem we introduce a novel and efficient method called RetMMD that leverages Maximum Mean Discrepancy (MMD) and kernel methods to assess the transferability of pretrained models in retrieval tasks. RetMMD is calculated on pretrained model and target dataset without any fine-tuning involved. Specifically given some query we quantify the distribution discrepancy between relevant and irrelevant document embeddings by estimating the similarities within their mappings in the fine-tuned embedding space through kernel method. This discrepancy is averaged over multiple queries taking into account the distribution characteristics of the target dataset. Experiments suggest that the proposed metric calculated on pre-trained models closely aligns with retrieval performance post-fine-tuning. The observation holds across a variety of datasets including image text and multi-modal domains indicating the potential of using MMD and kernel methods for transfer learning evaluation in retrieval scenarios. In addition we also design a way of evaluating dataset transferability for retrieval tasks with experimental results demonstrating the effectiveness of the proposed approach.

AnyScene: Customized Image Synthesis with Composited Foreground
Ruidong Chen, Lanjun Wang, Weizhi Nie, Yongdong Zhang, An-An Liu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 8724-8733
Recent advancements in text-to-image technology have significantly advanced the field of image customization. Among various applications the task of customizing diverse scenes for user-specified composited elements holds great application value but has not been extensively explored. Addressing this gap we propose AnyScene a specialized framework designed to create varied scenes from composited foreground using textual prompts. AnyScene addresses the primary challenges inherent in existing methods particularly scene disharmony due to a lack of foreground semantic understanding and distortion of foreground elements. Specifically we develop a foreground injection module that guides a pre-trained diffusion model to generate cohesive scenes in visual harmony with the provided foreground. To enhance robust generation we implement a layout control strategy that prevents distortions of foreground elements. Furthermore an efficient image blending mechanism seamlessly reintegrates foreground details into the generated scenes producing

outputs with overall visual harmony and precise foreground details. In addition we propose a new benchmark and a series of quantitative metrics to evaluate this proposed image customization task. Extensive experimental results demonstrate the effectiveness of AnyScene which confirms its potential in various applications.

Training Generative Image Super-Resolution Models by Wavelet-Domain Losses Enables Better Control of Artifacts
Cansu Korkmaz, A. Murat Tekalp, Zafer Dogan; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 5926-5936
Super-resolution (SR) is an ill-posed inverse problem where the size of the set of feasible solutions that are consistent with a given low-resolution image is very large. Many algorithms have been proposed to find a "good" solution among the feasible solutions that strike a balance between fidelity and perceptual quality. Unfortunately all known methods generate artifacts and hallucinations while trying to reconstruct high-frequency (HF) image details. A fundamental question is: Can a model learn to distinguish genuine image details from artifacts? Although some recent works focused on the differentiation of details and artifacts this is a very challenging problem and a satisfactory solution is yet to be found. This paper shows that the characterization of genuine HF details versus artifacts can be better learned by training GAN-based SR models using wavelet-domain loss functions compared to RGB-domain or Fourier-space losses. Although wavelet-domain losses have been used in the literature before they have not been used in the context of the SR task. More specifically we train the discriminator only on the HF wavelet sub-bands instead of on RGB images and the generator is trained by a fidelity loss over wavelet subbands to make it sensitive to the scale and orientation of structures. Extensive experimental results demonstrate that our model achieves better perception-distortion trade-off according to multiple objective measures and visual evaluations.

Visual Objectification in Films: Towards a New AI Task for Video Interpretation
Julie Tores, Lucile Sassatelli, Hui-Yin Wu, Clement Bergman, Léa Andolfi, Victor Ecrement, Frédéric Precioso, Thierry Devars, Magali Guaresi, Virginie Julliard, Sarah Lecossais; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 10864-10874
In film gender studies the concept of "male gaze" refers to the way the characters are portrayed on-screen as objects of desire rather than subjects. In this article we introduce a novel video-interpretation task to detect character objectification in films. The purpose is to reveal and quantify the usage of complex temporal patterns operated in cinema to produce the cognitive perception of objectification. We introduce the ObyGaze12 dataset made of 1914 movie clips densely annotated by experts for objectification concepts identified in film studies and psychology. We evaluate recent vision models show the feasibility of the task and where the challenges remain with concept bottleneck models. Our new dataset and code are made available to the community.

BiTT: Bi-directional Texture Reconstruction of Interacting Two Hands from a Sing
le Image
Minje Kim, Tae-Kyun Kim; Proceedings of the IEEE/CVF Conference on Computer Visi
on and Pattern Recognition (CVPR), 2024, pp. 10726-10735
Creating personalized hand avatars is important to offer a realistic experience
to users on AR / VR platforms. While most prior studies focused on reconstructin
g 3D hand shapes some recent work has tackled the reconstruction of hand texture
s on top of shapes. However these methods are often limited to capturing pixels
on the visible side of a hand requiring diverse views of the hand in a video or
multiple images as input. In this paper we propose a novel method BiTT(Bi-direct
ional Texture reconstruction of Two hands) which is the first end-to-end train-
able method for relightable pose-free texture reconstruction of two interacting
hands taking only a single RGB image by three novel components: 1) bi-directiona
l (left ? right) texture reconstruction using the texture symmetry of left / rig
ht hands 2) utilizing a texture parametric model for hand texture recovery and 3
) the overall coarse-to-fine stage pipeline for reconstructing personalized text
ure of two interacting hands. BiTT first estimates the scene light condition and
 albedo image from an input image then reconstructs the texture of both hands th
rough the texture parametric model and bi-directional texture reconstructor. In
experiments using InterHand2.6M and RGB2Hands datasets our method significantly
outperforms state-of-the-art hand texture reconstruction methods quantitatively
and qualitatively. The code is available at https://github.com/ yunminjin2/BiTT.

DetCLIPv3: Towards Versatile Generative Open-vocabulary Object Detection
Lewei Yao, Renjie Pi, Jianhua Han, Xiaodan Liang, Hang Xu, Wei Zhang, Zhenguo Li
, Dan Xu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern
Recognition (CVPR), 2024, pp. 27391-27401
Existing open-vocabulary object detectors typically require a predefined set of
categories from users significantly confining their application scenarios. In th
is paper we introduce DetCLIPv3 a high-performing detector that excels not only
at both open-vocabulary object detection but also generating hierarchical labels
 for detected objects. DetCLIPv3 is characterized by three core designs: 1. Vers
atile model architecture: we derive a robust open-set detection framework which
is further empowered with generation ability via the integration of a caption he
ad. 2. High information density data: we develop an auto-annotation pipeline lev
eraging visual large language model to refine captions for large-scale image-tex
t pairs providing rich multi-granular object labels to enhance the training. 3.
Efficient training strategy: we employ a pre-training stage with low-resolution
inputs that enables the object captioner to efficiently learn a broad spectrum o
f visual concepts from extensive image-text paired data. This is followed by a f
ine-tuning stage that leverages a small number of high-resolution samples to fur
ther enhance detection performance. With these effective designs DetCLIPv3 demon
strates superior open-vocabulary detection performance e.g. our Swin-T backbone
model achieves a notable 47.0 zero-shot fixed AP on the LVIS minival benchmark o
utperforming GLIPv2 GroundingDINO and DetCLIPv2 by 18.0/19.6/6.6 AP respectively
. DetCLIPv3 also achieves a state-of-the-art 19.7 AP in dense captioning task on
 VG dataset showcasing its strong generative capability.

UVEB: A Large-scale Benchmark and Baseline Towards Real-World Underwater Video E
nhancement
Yaofeng Xie, Lingwei Kong, Kai Chen, Ziqiang Zheng, Xiao Yu, Zhibin Yu, Bing Zhe
ng; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recogn
ition (CVPR), 2024, pp. 22358-22367
Learning-based underwater image enhancement (UIE) methods have made great progre
ss. However the lack of large-scale and high-quality paired training samples has
 become the main bottleneck hindering the development of UIE. The inter-frame in

formation in underwater videos can accelerate or optimize the UIE process. Thus we constructed the first large-scale high-resolution underwater video enhancement benchmark (UVEB) to promote the development of underwater vision.It contains 1308 pairs of video sequences and more than 453000 high-resolution with 38% Ultra-High-Definition (UHD) 4K frame pairs. UVEB comes from multiple countries containing various scenes and video degradation types to adapt to diverse and complex underwater environments. We also propose the first supervised underwater video enhancement method UVE-Net. UVE-Net converts the current frame information into convolutional kernels and passes them to adjacent frames for efficient inter-frame information exchange. By fully utilizing the redundant degraded information of underwater videos UVE-Net completes video enhancement better. Experiments show the effective network design and good performance of UVE-Net.

Learning to Localize Objects Improves Spatial Reasoning in Visual-LLMs
Kanchana Ranasinghe, Satya Narayan Shukla, Omid Poursaeed, Michael S. Ryoo, Tsung-Yu Lin; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 12977-12987
Integration of Large Language Models (LLMs) into visual domain tasks resulting in visual-LLMs (V-LLMs) has enabled exceptional performance in vision-language tasks particularly for visual question answering (VQA). However existing V-LLMs (e.g. BLIP-2 LLaVA) demonstrate weak spatial reasoning and localization awareness. Despite generating highly descriptive and elaborate textual answers these models fail at simple tasks like distinguishing a left vs right location. In this work we explore how image-space coordinate based instruction fine-tuning objectives could inject spatial awareness into V-LLMs. We discover optimal coordinate representations data-efficient instruction fine-tuning objectives and pseudo-data generation strategies that lead to improved spatial awareness in V-LLMs. Additionally our resulting model improves VQA across image and video domains reduces undesired hallucination and generates better contextual object descriptions. Experiments across 5 vision-language tasks involving 14 different datasets establish the clear performance improvements achieved by our proposed framework.
****
Monocular Identity-Conditioned Facial Reflectance Reconstruction
Xingyu Ren, Jiankang Deng, Yuhao Cheng, Jia Guo, Chao Ma, Yichao Yan, Wenhan Zhu, Xiaokang Yang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 885-895
Recent 3D face reconstruction methods have made remarkable advancements yet there remain huge challenges in monocular high-quality facial reflectance reconstruction. Existing methods rely on a large amount of light-stage captured data to learn facial reflectance models. However the lack of subject diversity poses challenges in achieving good generalization and widespread applicability. In this paper we learn the reflectance prior in image space rather than UV space and present a framework named ID2Reflectance. Our framework can directly estimate the reflectance maps of a single image while using limited reflectance data for training. Our key insight is that reflectance data shares facial structures with RGB faces which enables obtaining expressive facial prior from inexpensive RGB data thus reducing the dependency on reflectance data. We first learn a high-quality prior for facial reflectance. Specifically we pretrain multi-domain facial feature codebooks and design a codebook fusion method to align the reflectance and RGB domains. Then we propose an identity-conditioned swapping module that injects facial identity from the target image into the pre-trained auto-encoder to modify the identity of the source reflectance image. Finally we stitch multi-view swapped reflectance images to obtain renderable assets. Extensive experiments demonstrate that our method exhibits excellent generalization capability and achieves state-of-the-art facial reflectance reconstruction results for in-the-wild faces.

C3: High-Performance and Low-Complexity Neural Compression from a Single Image or Video
Hyunjik Kim, Matthias Bauer, Lucas Theis, Jonathan Richard Schwarz, Emilien Dupont; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recogn

ition (CVPR), 2024, pp. 9347-9358
Most neural compression models are trained on large datasets of images or videos in order to generalize to unseen data. Such generalization typically requires large and expressive architectures with a high decoding complexity. Here we introduce C3 a neural compression method with strong rate-distortion (RD) performance that instead overfits a small model to each image or video separately. The resulting decoding complexity of C3 can be an order of magnitude lower than neural baselines with similar RD performance. C3 builds on COOL-CHIC [Ladune et al 2023] and makes several simple and effective improvements for images. We further develop new methodology to apply C3 to videos. On the CLIC2020 image benchmark we match the RD performance of VTM the reference implementation of the H.266 codec with less than3k MACs/pixel for decoding. On the UVG video benchmark we match the RD performance of the Video Compression Transformer [Mentzer er al 2022] a well-established neural video codec with less than 5k MACs/pixel for decoding.

Self-Distilled Masked Auto-Encoders are Efficient Video Anomaly Detectors
Nicolae-C?t?lin Ristea, Florinel-Alin Croitoru, Radu Tudor Ionescu, Marius Popescu, Fahad Shahbaz Khan, Mubarak Shah; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 15984-15995
We propose an efficient abnormal event detection model based on a lightweight masked auto-encoder (AE) applied at the video frame level. The novelty of the proposed model is threefold. First we introduce an approach to weight tokens based on motion gradients thus shifting the focus from the static background scene to the foreground objects. Second we integrate a teacher decoder and a student decoder into our architecture leveraging the discrepancy between the outputs given by the two decoders to improve anomaly detection. Third we generate synthetic abnormal events to augment the training videos and task the masked AE model to jointly reconstruct the original frames (without anomalies) and the corresponding pixel-level anomaly maps. Our design leads to an efficient and effective model as demonstrated by the extensive experiments carried out on four benchmarks: Avenue ShanghaiTech UBnormal and UCSD Ped2. The empirical results show that our model achieves an excellent trade-off between speed and accuracy obtaining competitive AUC scores while processing 1655 FPS. Hence our model is between 8 and 70 times faster than competing methods. We also conduct an ablation study to justify our design. Our code is freely available at: https://github.com/ristea/aed-mae.

Revisiting Non-Autoregressive Transformers for Efficient Image Synthesis
Zanlin Ni, Yulin Wang, Renping Zhou, Jiayi Guo, Jinyi Hu, Zhiyuan Liu, Shiji Song, Yuan Yao, Gao Huang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 7007-7016
The field of image synthesis is currently flourishing due to the advancements in diffusion models. While diffusion models have been successful their computational intensity has prompted the pursuit of more efficient alternatives. As a representative work non-autoregressive Transformers (NATs) have been recognized for their rapid generation. However a major drawback of these models is their inferior performance compared to diffusion models. In this paper we aim to re-evaluate the full potential of NATs by revisiting the design of their training and inference strategies. Specifically we identify the complexities in properly configuring these strategies and indicate the possible sub-optimality in existing heuristic-driven designs. Recognizing this we propose to go beyond existing methods by directly solving the optimal strategies in an automatic framework. The resulting method named AutoNAT advances the performance boundaries of NATs notably and is able to perform comparably with the latest diffusion models with a significantly reduced inference cost. The effectiveness of AutoNAT is comprehensively validated on four benchmark datasets i.e. ImageNet-256 & 512 MS-COCO and CC3M. Code and pre-trained models will be available at https://github.com/LeapLabTHU/ImprovedNAT.

Distilling Vision-Language Models on Millions of Videos
Yue Zhao, Long Zhao, Xingyi Zhou, Jialin Wu, Chun-Te Chu, Hui Miao, Florian Schr

off, Hartwig Adam, Ting Liu, Boqing Gong, Philipp Krahenbuhl, Liangzhe Yuan; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 13106-13116

The recent advance in vision-language models is largely attributed to the abundance of image-text data. We aim to replicate this success for video-language models but there simply is not enough human-curated video-text data available. We thus resort to fine-tuning a video-language model from a strong image-language baseline with synthesized instructional data. The resulting video model by video-instruction-tuning (VIIT) is then used to auto-label millions of videos to generate high-quality captions. We show the adapted video-language model performs well on a wide range of video-language benchmarks. For instance it surpasses the best prior result on open-ended NExT-QA by2.8%. Besides our model generates detailed descriptions for previously unseen videos which provide better textual supervision than existing methods. Experiments show that a video-language dual-encoder model contrastively trained on these auto-generated captions is 3.8% better than the strongest baseline that also leverages vision-language models. Our best model outperforms state-of-the-art methods on MSR-VTT zero-shot text-to-video retrieval by 6%. As a side product we generate the largest video caption dataset to date.

ANIM: Accurate Neural Implicit Model for Human Reconstruction from a single RGB-D Image

Marco Pesavento, Yuanlu Xu, Nikolaos Sarafianos, Robert Maier, Ziyan Wang, Chun-Han Yao, Marco Volino, Edmond Boyer, Adrian Hilton, Tony Tung; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 5448-5458

Recent progress in human shape learning shows that neural implicit models are effective in generating 3D human surfaces from limited number of views and even from a single RGB image. However existing monocular approaches still struggle to recover fine geometric details such as face hands or cloth wrinkles. They are also easily prone to depth ambiguities that result in distorted geometries along the camera optical axis. In this paper we explore the benefits of incorporating depth observations in the reconstruction process by introducing ANIM a novel method that reconstructs arbitrary 3D human shapes from single-view RGB-D images with an unprecedented level of accuracy. Our model learns geometric details from both multi-resolution pixel-aligned and voxel-aligned features to leverage depth information and enable spatial relationships mitigating depth ambiguities. We further enhance the quality of the reconstructed shape by introducing a depth-supervision strategy which improves the accuracy of the signed distance field estimation of points that lie on the reconstructed surface. Experiments demonstrate that ANIM outperforms state-of-the-art works that use RGB surface normals point cloud or RGB-D data as input. In addition we introduce ANIM-Real a new multi-modal dataset comprising high-quality scans paired with consumer-grade RGB-D camera and our protocol to fine-tune ANIM enabling high-quality reconstruction from real-world human capture.

Real-Time Simulated Avatar from Head-Mounted Sensors

Zhengyi Luo, Jinkun Cao, Rawal Khirodkar, Alexander Winkler, Kris Kitani, Weipeng Xu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 571-581

We present SimXR a method for controlling a simulated avatar from information (headset pose and cameras) obtained from AR / VR headsets. Due to the challenging viewpoint of head-mounted cameras the human body is often clipped out of view making traditional image-based egocentric pose estimation challenging. On the other hand headset poses provide valuable information about overall body motion but lack fine-grained details about the hands and feet. To synergize headset poses with cameras we control a humanoid to track headset movement while analyzing input images to decide body movement. When body parts are seen the movements of hands and feet will be guided by the images; when unseen the laws of physics guide the controller to generate plausible motion. We design an end-to-end method that

does not rely on any intermediate representations and learns to directly map from images and headset poses to humanoid control signals. To train our method we also propose a large-scale synthetic dataset created using camera configurations compatible with a commercially available VR headset (Quest 2) and show promising results on real-world captures. To demonstrate the applicability of our framework we also test it on an AR headset with a forward-facing camera.

Discovering Syntactic Interaction Clues for Human-Object Interaction Detection
Jinguo Luo, Weihong Ren, Weibo Jiang, Xi'ai Chen, Qiang Wang, Zhi Han, Honghai Liu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 28212-28222
Recently Vision-Language Model (VLM) has greatly advanced the Human-Object Interaction (HOI) detection. The existing VLM-based HOI detectors typically adopt a hand-crafted template (e.g. a photo of a person [action] a/an [object]) to acquire text knowledge through the VLM text encoder. However such approaches only encoding the action-specific text prompts in vocabulary level may suffer from learning ambiguity without exploring the fine-grained clues from the perspective of interaction context. In this paper we propose a novel method to discover Syntactic Interaction Clues for HOI detection (SICHOI) by using VLM. Specifically we first investigate what are the essential elements for an interaction context and then establish a syntactic interaction bank from three levels: spatial relationship action-oriented posture and situational condition. Further to align visual features with the syntactic interaction bank we adopt a multi-view extractor to jointly aggregate visual features from instance interaction and image levels accordingly. In addition we also introduce a dual cross-attention decoder to perform context propagation between text knowledge and visual features thereby enhancing the HOI detection. Experimental results demonstrate that our proposed method achieves state-of-the-art performance on HICO-DET and V-COCO.

Inter-X: Towards Versatile Human-Human Interaction Analysis
Liang Xu, Xintao Lv, Yichao Yan, Xin Jin, Shuwen Wu, Congsheng Xu, Yifan Liu, Yizhou Zhou, Fengyun Rao, Xingdong Sheng, Yunhui Liu, Wenjun Zeng, Xiaokang Yang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 22260-22271
The analysis of the ubiquitous human-human interactions is pivotal for understanding humans as social beings. Existing human-human interaction datasets typically suffer from inaccurate body motions lack of hand gestures and fine-grained textual descriptions. To better perceive and generate human-human interactions we propose Inter-X a currently largest human-human interaction dataset with accurate body movements and diverse interaction patterns together with detailed hand gestures. The dataset includes 11K interaction sequences and more than 8.1M frames. We also equip Inter-X with versatile annotations of more than 34K fine-grained human part-level textual descriptions semantic interaction categories interaction order and the relationship and personality of the subjects. Based on the elaborate annotations we propose a unified benchmark composed of 4 categories of downstream tasks from both the perceptual and generative directions. Extensive experiments and comprehensive analysis show that Inter-X serves as a testbed for promoting the development of versatile human-human interaction analysis. Our dataset and benchmark will be publicly available for research purposes.

Generalized Predictive Model for Autonomous Driving
Jiazhi Yang, Shenyuan Gao, Yihang Qiu, Li Chen, Tianyu Li, Bo Dai, Kashyap Chitta, Penghao Wu, Jia Zeng, Ping Luo, Jun Zhang, Andreas Geiger, Yu Qiao, Hongyang Li; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 14662-14672
In this paper we introduce the first large-scale video prediction model in the autonomous driving discipline. To eliminate the restriction of high-cost data collection and empower the generalization ability of our model we acquire massive data from the web and pair it with diverse and high-quality text descriptions. The resultant dataset accumulates over 2000 hours of driving videos spanning areas

all over the world with diverse weather conditions and traffic scenarios. Inheriting the merits from recent latent diffusion models our model dubbed GenAD handles the challenging dynamics in driving scenes with novel temporal reasoning blocks. We showcase that it can generalize to various unseen driving datasets in a zero-shot manner surpassing general or driving-specific video prediction counterparts. Furthermore GenAD can be adapted into an action-conditioned prediction model or a motion planner holding great potential for real-world driving applications.

FACT: Frame-Action Cross-Attention Temporal Modeling for Efficient Action Segmentation
Zijia Lu, Ehsan Elhamifar; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 18175-18185
We study supervised action segmentation whose goal is to predict framewise action labels of a video. To capture temporal dependencies over long horizons prior works either improve framewise features with transformer or refine framewise predictions with learned action features. However they are computationally costly and ignore that frame and action features contain complimentary information which can be leveraged to enhance both features and improve temporal modeling. Therefore we propose an efficient Frame-Action Cross-attention Temporal modeling (FACT) framework that performs temporal modeling with frame and action features in parallel and leverage this parallelism to achieve iterative bidirectional information transfer between the features and refine them. FACT network contains (i) a frame branch to learn frame-level information with convolutions and frame features (ii) an action branch to learn action-level dependencies with transformers and action tokens and (iii) cross-attentions to allow communication between the two branches. We also propose a new matching loss to ensure each action token uniquely encodes an action segment thus better captures its semantics. Thanks to our architecture we can also leverage textual transcripts of videos to help action segmentation. We evaluate FACT on four video datasets (two egocentric and two third-person) for action segmentation with and without transcripts showing that it significantly improves the state-of-the-art accuracy while enjoys lower computational cost (3 times faster) than existing transformer-based methods
****
Test-Time Zero-Shot Temporal Action Localization
Benedetta Liberatori, Alessandro Conti, Paolo Rota, Yiming Wang, Elisa Ricci; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 18720-18729
Zero-Shot Temporal Action Localization (ZS-TAL) seeks to identify and locate actions in untrimmed videos unseen during training. Existing ZS-TAL methods involve fine-tuning a model on a large amount of annotated training data. While effective training-based ZS-TAL approaches assume the availability of labeled data for supervised learning which can be impractical in some applications. Furthermore the training process naturally induces a domain bias into the learned model which may adversely affect the model's generalization ability to arbitrary videos. These considerations prompt us to approach the ZS-TAL problem from a radically novel perspective relaxing the requirement for training data. To this aim we introduce a novel method that performs Test-Time adaptation for Temporal Action Localization (T3AL). In a nutshell T3AL adapts a pre-trained Vision and Language Model (VLM). T3AL operates in three steps. First a video-level pseudo-label of the action category is computed by aggregating information from the entire video. Then action localization is performed adopting a novel procedure inspired by self-supervised learning. Finally frame-level textual descriptions extracted with a state-of-the-art captioning model are employed for refining the action region proposals. We validate the effectiveness of T 3AL by conducting experiments on the THUMOS14 and the ActivityNet-v1.3 datasets. Our results demonstrate that T3AL significantly outperforms zero-shot baselines based on state-of-the-art VLMs confirming the benefit of a test-time adaptation approach.
****
AM-RADIO: Agglomerative Vision Foundation Model Reduce All Domains Into One

Mike Ranzinger, Greg Heinrich, Jan Kautz, Pavlo Molchanov; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 12490-12500
A handful of visual foundation models (VFMs) have recently emerged as the backbones for numerous downstream tasks. VFMs like CLIP DINOv2 SAM are trained with distinct objectives exhibiting unique characteristics for various downstream tasks. We find that despite their conceptual differences these models can be effectively merged into a unified model through multi-teacher distillation. We name this approach AM-RADIO (Agglomerative Model -- Reduce All Domains Into One). This integrative approach not only surpasses the performance of individual teacher models but also amalgamates their distinctive features such as zero-shot vision-language comprehension detailed pixel-level understanding and open vocabulary segmentation capabilities. Additionally in pursuit of the most hardware-efficient backbone we evaluated numerous architectures in our multi-teacher distillation pipeline using the same training recipe. This led to the development of a novel architecture (E-RADIO) that exceeds the performance of its predecessors and is at least 6x faster than the teacher models at matched resolution. Our comprehensive benchmarking process covers downstream tasks including ImageNet classification semantic segmentation linear probing COCO object detection and integration into LLaVa-1.5.
****
MaskClustering: View Consensus based Mask Graph Clustering for Open-Vocabulary 3D Instance Segmentation
Mi Yan, Jiazhao Zhang, Yan Zhu, He Wang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 28274-28284
Open-vocabulary 3D instance segmentation is cutting-edge for its ability to segment 3D instances without predefined categories. However progress in 3D lags behind its 2D counterpart due to limited annotated 3D data. To address this recent works first generate 2D open-vocabulary masks through 2D models and then merge them into 3D instances based on metrics calculated between two neighboring frames. In contrast to these local metrics we propose a novel metric view consensus rate to enhance the utilization of multi-view observations. The key insight is that two 2D masks should be deemed part of the same 3D instance if a significant number of other 2D masks from different views contain both these two masks. Using this metric as edge weight we construct a global mask graph where each mask is a node. Through iterative clustering of masks showing high view consensus we generate a series of clusters each representing a distinct 3D instance. Notably our model is training-free. Through extensive experiments on publicly available datasets including ScanNet++ ScanNet200 and MatterPort3D we demonstrate that our method achieves state-of-the-art performance in open-vocabulary 3D instance segmentation. Our project page is at \href https://pku-epic.github.io/MaskClustering/ https://pku-epic.github.io/MaskClustering .

Seamless Human Motion Composition with Blended Positional Encodings
German Barquero, Sergio Escalera, Cristina Palmero; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 457-469
Conditional human motion generation is an important topic with many applications in virtual reality gaming and robotics. While prior works have focused on generating motion guided by text music or scenes these typically result in isolated motions confined to short durations. Instead we address the generation of long continuous sequences guided by a series of varying textual descriptions. In this context we introduce FlowMDM the first diffusion-based model that generates seamless Human Motion Compositions (HMC) without any postprocessing or redundant denoising steps. For this we introduce the Blended Positional Encodings a technique that leverages both absolute and relative positional encodings in the denoising chain. More specifically global motion coherence is recovered at the absolute stage whereas smooth and realistic transitions are built at the relative stage. As a result we achieve state-of-the-art results in terms of accuracy realism and smoothness on the Babel and HumanML3D datasets. FlowMDM excels when trained with only a single description per motion sequence thanks to its Pose-Centric Cross-A

Ttention which makes it robust against varying text descriptions at inference time. Finally to address the limitations of existing HMC metrics we propose two new metrics: the Peak Jerk and the Area Under the Jerk to detect abrupt transitions.

PeerAiD: Improving Adversarial Distillation from a Specialized Peer Tutor
Jaewon Jung, Hongsun Jang, Jaeyong Song, Jinho Lee; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 24482-24491
Adversarial robustness of the neural network is a significant concern when it is applied to security-critical domains. In this situation adversarial distillation is a promising option which aims to distill the robustness of the teacher network to improve the robustness of a small student network. Previous works pretrain the teacher network to make it robust against the adversarial examples aimed at itself. However the adversarial examples are dependent on the parameters of the target network. The fixed teacher network inevitably degrades its robustness against the unseen transferred adversarial examples which target the parameters of the student network in the adversarial distillation process. We propose PeerAiD to make a peer network learn the adversarial examples of the student network instead of adversarial examples aimed at itself. PeerAiD is an adversarial distillation that trains the peer network and the student network simultaneously in order to specialize the peer network for defending the student network. We observe that such peer networks surpass the robustness of the pretrained robust teacher model against adversarial examples aimed at the student network. With this peer network and adversarial distillation PeerAiD achieves significantly higher robustness of the student network with AutoAttack (AA) accuracy by up to 1.66%p and improves the natural accuracy of the student network by up to 4.72%p with ResNet-18 on TinyImageNet dataset. Code is available at https://github.com/jaewonalive/PeerAiD.

Scaling Laws for Data Filtering-- Data Curation cannot be Compute Agnostic
Sachin Goyal, Pratyush Maini, Zachary C. Lipton, Aditi Raghunathan, J. Zico Kolter; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 22702-22711
Vision-language models (VLMs) are trained for thousands of GPU hours on carefully selected subsets of massive web scrapes. For instance the LAION public dataset retained only about 10 percent of the total crawled data. In recent times data curation has gained prominence with several works developing strategies to retain high-quality subsets of raw scraped data. However these strategies are typically developed agnostic to the available compute for training. In this paper we demonstrate that making filtering decisions independent of training compute is often suboptimal: well-curated data rapidly loses its utility when repeated eventually decreasing below the utility of unseen but lower-quality data. While past research in neural scaling laws has considered web data to be homogenous real data is not. Our work bridges this important gap in the literature by developing scaling laws that characterize the differing utility of various data subsets and accounting for how this diminishes for a data point at its nth repetition. Our key message is that data curation can not be agnostic of the total compute a model will be trained for. Even without ever jointly training on multiple data buckets our scaling laws enable us to estimate model performance under this dynamic trade-off between quality and repetition. This allows us to curate the best possible pool for achieving top performance on Datacomp at various compute budgets carving out a pareto-frontier for data curation.

FastMAC: Stochastic Spectral Sampling of Correspondence Graph
Yifei Zhang, Hao Zhao, Hongyang Li, Siheng Chen; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 17857-17867
3D correspondence i.e. a pair of 3D points is a fundamental concept in computer vision. A set of 3D correspondences when equipped with compatibility edges forms a correspondence graph. This graph is a critical component in several state-of-

the-art 3D point cloud registration approaches e.g. the one based on maximal cliques (MAC). However its properties have not been well understood. So we present the first study that introduces graph signal processing into the domain of correspondence graph. We exploit the generalized degree signal on correspondence graph and pursue sampling strategies that preserve high-frequency components of this signal. To address time-consuming singular value decomposition in deterministic sampling we resort to a stochastic approximate sampling strategy. As such the core of our method is the stochastic spectral sampling of correspondence graph. As an application we build a complete 3D registration algorithm termed as FastMAC that reaches real-time speed while leading to little to none performance drop. Through extensive experiments we validate that FastMAC works for both indoor and outdoor benchmarks. For example FastMAC can accelerate MAC by 80 times while maintaining high registration success rate on KITTI. Codes are publicly available at https://github.com/Forrest-110/FastMAC.

FedUV: Uniformity and Variance for Heterogeneous Federated Learning
Ha Min Son, Moon-Hyun Kim, Tai-Myoung Chung, Chao Huang, Xin Liu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 5863-5872
Federated learning is a promising framework to train neural networks with widely distributed data. However performance degrades heavily with heterogeneously distributed data. Recent work has shown this is due to the final layer of the network being most prone to local bias some finding success freezing the final layer as an orthogonal classifier. We investigate the training dynamics of the classifier by applying SVD to the weights motivated by the observation that freezing weights results in constant singular values. We find that there are differences when training in IID and non-IID settings. Based on this finding we introduce two regularization terms for local training to continuously emulate IID settings: (1) variance in the dimension-wise probability distribution of the classifier and (2) hyperspherical uniformity of representations of the encoder. These regularizations promote local models to act as if it were in an IID setting regardless of the local data distribution thus offsetting proneness to bias while being flexible to the data. On extensive experiments in both label-shift and feature-shift settings we verify that our method achieves highest performance by a large margin especially in highly non-IID cases in addition to being scalable to larger models and datasets.
****
FedSOL: Stabilized Orthogonal Learning with Proximal Restrictions in Federated Learning
Gihun Lee, Minchan Jeong, Sangmook Kim, Jaehoon Oh, Se-Young Yun; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 12512-12522
Federated Learning (FL) aggregates locally trained models from individual clients to construct a global model. While FL enables learning a model with data privacy it often suffers from significant performance degradation when clients have heterogeneous data distributions. This data heterogeneity causes the model to forget the global knowledge acquired from previously sampled clients after being trained on local datasets. Although the introduction of proximal objectives in local updates helps to preserve global knowledge it can also hinder local learning by interfering with local objectives. Inspired by Continual Learning (CL) we adopt an orthogonal learning strategy to balance these two conflicting objectives. However we observe that directly negating the proximal gradient in the local gradient significantly undermines local learning. To address the problem we propose a novel method Federated Stabilized Orthogonal Learning (FedSOL). FedSOL is designed to identify gradients of local objectives that are inherently orthogonal to directions affecting the proximal objective. Specifically FedSOL targets parameter regions where learning on the local objective is minimally influenced by proximal weight perturbations. Our experiments demonstrate that FedSOL consistently achieves state-of-the-art performance across various scenarios.
****

GAvatar: Animatable 3D Gaussian Avatars with Implicit Mesh Learning
Ye Yuan, Xueting Li, Yangyi Huang, Shalini De Mello, Koki Nagano, Jan Kautz, Umar Iqbal; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 896-905
Gaussian splatting has emerged as a powerful 3D representation that harnesses the advantages of both explicit (mesh) and implicit (NeRF) 3D representations. In this paper we seek to leverage Gaussian splatting to generate realistic animatable avatars from textual descriptions addressing the limitations (e.g. efficiency and flexibility) imposed by mesh or NeRF-based representations. However a naive application of Gaussian splatting cannot generate high-quality animatable avatars and suffers from learning instability; it also cannot capture fine avatar geometries and often leads to degenerate body parts. To tackle these problems we first propose a primitive-based 3D Gaussian representation where Gaussians are defined inside pose-driven primitives to facilitate animations. Second to stabilize and amortize the learning of millions of Gaussians we propose to use implicit neural fields to predict the Gaussian attributes (e.g. colors). Finally to capture fine avatar geometries and extract detailed meshes we propose a novel SDF-based implicit mesh learning approach for 3D Gaussians that regularizes the underlying geometries and extracts highly detailed textured meshes. Our proposed method GAvatar enables the large-scale generation of diverse animatable avatars using only text prompts. GAvatar significantly surpasses existing methods in terms of both appearance and geometry quality and achieves extremely fast rendering (100 fps) at 1K resolution.
****
Beyond Average: Individualized Visual Scanpath Prediction
Xianyu Chen, Ming Jiang, Qi Zhao; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 25420-25431
Understanding how attention varies across individuals has significant scientific and societal impacts. However existing visual scanpath models treat attention uniformly neglecting individual differences. To bridge this gap this paper focuses on individualized scanpath prediction (ISP) a new attention modeling task that aims to accurately predict how different individuals shift their attention in diverse visual tasks. It proposes an ISP method featuring three novel technical components: (1) an observer encoder to characterize and integrate an observer's unique attention traits (2) an observer-centric feature integration approach that holistically combines visual features task guidance and observer-specific characteristics and (3) an adaptive fixation prioritization mechanism that refines scanpath predictions by dynamically prioritizing semantic feature maps based on individual observers' attention traits. These novel components allow scanpath models to effectively address the attention variations across different observers. Our method is generally applicable to different datasets model architectures and visual tasks offering a comprehensive tool for transforming general scanpath models into individualized ones. Comprehensive evaluations using value-based and ranking-based metrics verify the method's effectiveness and generalizability.
****
A Category Agnostic Model for Visual Rearrangment
Yuyi Liu, Xinhang Song, Weijie Li, Xiaohan Wang, Shuqiang Jiang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 16457-16466
This paper presents a novel category agnostic model for visual rearrangement task which can help an embodied agent to physically recover the shuffled scene configuration without any category concepts to the goal configuration. Previous methods usually follow a similar architecture completing the rearrangement task by aligning the scene changes of the goal and shuffled configuration according to the semantic scene graphs. However constructing scene graphs requires the inference of category labels which not only causes the accuracy drop of the entire task but also limits the application in real world scenario. In this paper we delve deep into the essence of visual rearrangement task and focus on the two most essential issues scene change detection and scene change matching. We utilize the movement and the protrusion of point cloud to accurately identify the scene change

s and match these changes depending on the similarity of category agnostic appea rance feature. Moreover to assist the agent to explore the environment more effi ciently and comprehensively we propose a closer-aligned-retrace exploration poli cy aiming to observe more details of the scene at a closer distance. We conduct extensive experiments on AI2THOR Rearrangement Challenge based on RoomR dataset and a new multi-room multi-instance dataset MrMiR collected by us. The experimen tal results demonstrate the effectiveness of our proposed method.

Grounding Everything: Emerging Localization Properties in Vision-Language Transf ormers
Walid Bousselham, Felix Petersen, Vittorio Ferrari, Hilde Kuehne; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024 , pp. 3828-3837
Vision-language foundation models have shown remarkable performance in various z ero-shot settings such as image retrieval classification or captioning. But so f ar those models seem to fall behind when it comes to zero-shot localization of r eferential expressions and objects in images. As a result they need to be fine-t uned for this task. In this paper we show that pretrained vision-language (VL) m odels allow for zero-shot open-vocabulary object localization without any fine-t uning. To leverage those capabilities we propose a Grounding Everything Module (GEM) that generalizes the idea of value-value attention introduced by CLIPSurger y to a self-self attention path. We show that the concept of self-self attention corresponds to clustering thus enforcing groups of tokens arising from the same object to be similar while preserving the alignment with the language space. To further guide the group formation we propose a set of regularizations that allo ws the model to finally generalize across datasets and backbones. We evaluate th e proposed GEM framework on various benchmark tasks and datasets for semantic se gmentation. GEM not only outperforms other training-free open-vocabulary localiz ation methods but also achieves state-of-the-art results on the recently propose d OpenImagesV7 large-scale segmentation benchmark. Code is available at https:// github.com/WalBouss/GEM

Seeing Motion at Nighttime with an Event Camera
Haoyue Liu, Shihan Peng, Lin Zhu, Yi Chang, Hanyu Zhou, Luxin Yan; Proceedings o f the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 202 4, pp. 25648-25658
We focus on a very challenging task: imaging at nighttime dynamic scenes. Most p revious methods rely on the low-light enhancement of a conventional RGB camera. However they would inevitably face a dilemma between the long exposure time of n ighttime and the motion blur of dynamic scenes. Event cameras react to dynamic c hanges with higher temporal resolution (microsecond) and higher dynamic range (1 20dB) offering an alternative solution. In this work we present a novel nighttim e dynamic imaging method with an event camera. Specifically we discover that the event at nighttime exhibits temporal trailing characteristics and spatial non-s tationary distribution. Consequently we propose a nighttime event reconstruction network (NER-Net) which mainly includes a learnable event timestamps calibratio n module (LETC) to align the temporal trailing events and a non-uniform illumina tion aware module (NIAM) to stabilize the spatiotemporal distribution of events. Moreover we construct a paired real low-light event dataset (RLED) through a co -axial imaging system including 64200 spatially and temporally aligned image GTs and low-light events. Extensive experiments demonstrate that the proposed metho d outperforms state-of-the-art methods in terms of visual quality and generaliza tion ability on real-world nighttime datasets. The project are available at: htt ps://github.com/Liu-haoyue/NER-Net.

Representing Part-Whole Hierarchies in Foundation Models by Learning Localizabil ity Composability and Decomposability from Anatomy via Self Supervision
Mohammad Reza Hosseinzadeh Taher, Michael B. Gotway, Jianming Liang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2 024, pp. 11269-11281

Humans effortlessly interpret images by parsing them into part-whole hierarchies
; deep learning excels in learning multi-level feature spaces but they often lac
k explicit coding of part-whole relations a prominent property of medical imagin
g. To overcome this limitation we introduce Adam-v2 a new self-supervised learni
ng framework extending Adam [68] by explicitly incorporating part-whole hierarch
ies into its learning objectives through three key branches: (1) Localizability
acquiring discriminative representations to distinguish different anatomical pat
terns; (2) Composability learning each anatomical structure in a parts-to-whole
manner; and (3) Decomposability comprehending each anatomical structure in a who
le-to-parts manner. Experimental results across 10 tasks compared to 11 baseline
s in zero-shot few-shot transfer and full fine-tuning settings showcase Adam-v2'
s superior performance over large-scale medical models and existing SSL methods
across diverse downstream tasks. The higher generality and robustness of Adam-v2
's representations originate from its explicit construction of hierarchies for d
istinct anatomical structures from unlabeled medical images. Adam-v2 preserves a
 semantic balance of anatomical diversity and harmony in its embedding yielding
representations that are both generic and semantically meaningful yet overlooked
 in existing SSL methods. All code and pretrained models are available at GitHub
.com/JLiangLab/Eden.

Efficient Test-Time Adaptation of Vision-Language Models
Adilbek Karmanov, Dayan Guan, Shijian Lu, Abdulmotaleb El Saddik, Eric Xing; Pro
ceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (
CVPR), 2024, pp. 14162-14171
Test-time adaptation with pre-trained vision-language models has attracted incre
asing attention for tackling distribution shifts during the test time. Though pr
ior studies have achieved very promising performance they involve intensive comp
utation which is severely unaligned with test-time adaptation. We design TDA a t
raining-free dynamic adapter that enables effective and efficient test-time adap
tation with vision-language models. TDA works with a lightweight key-value cache
 that maintains a dynamic queue with few-shot pseudo labels as values and the co
rresponding test-sample features as keys. Leveraging the key-value cache TDA all
ows adapting to test data gradually via progressive pseudo label refinement whic
h is super-efficient without incurring any backpropagation. In addition we intro
duce negative pseudo labeling that alleviates the adverse impact of pseudo label
 noises by assigning pseudo labels to certain negative classes when the model is
 uncertain about its pseudo label predictions. Extensive experiments over two be
nchmarks demonstrate TDA's superior effectiveness and efficiency as compared wit
h the state-of-the-art. The code has been released in https://kdiaaa.github.io/t
da/.

Eyes Wide Shut? Exploring the Visual Shortcomings of Multimodal LLMs
Shengbang Tong, Zhuang Liu, Yuexiang Zhai, Yi Ma, Yann LeCun, Saining Xie; Proce
edings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CV
PR), 2024, pp. 9568-9578
Is vision good enough for language? Recent advancements in multimodal models pri
marily stem from the powerful reasoning abilities of large language models (LLMs
). However the visual component typically depends only on the instance-level con
trastive language-image pre-training (CLIP). Our research reveals that the visua
l capabilities in recent MultiModal LLMs (MLLMs) still exhibit systematic shortc
omings. To understand the roots of these errors we explore the gap between the v
isual embedding space of CLIP and vision-only self-supervised learning. We ident
ify "CLIP-blind pairs" - images that CLIP perceives as similar despite their cle
ar visual differences. With these pairs we construct the Multimodal Visual Patte
rns (MMVP) benchmark. MMVP exposes areas where state-of-the-art systems includin
g GPT-4V struggle with straightforward questions across nine basic visual patter
ns often providing incorrect answers and hallucinated explanations. We further e
valuate various CLIP-based vision-and-language models and found a notable correl
ation between visual patterns that challenge CLIP models and those problematic f
or multimodal LLMs. As an initial effort to address these issues we propose a Mi

xture of Features (MoF) approach demonstrating that integrating vision self-supe rvised learning features with MLLMs can significantly enhance their visual grounding capabilities. Together our research suggests visual representation learning remains an open challenge and accurate visual grounding is crucial for future successful multimodal systems.

Mean-Shift Feature Transformer
Takumi Kobayashi; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 6047-6056
Transformer models developed in NLP make a great impact on computer vision fields producing promising performance on various tasks. While multi-head attention a characteristic mechanism of the transformer attracts keen research interest such as for reducing computation cost we analyze the transformer model from a viewpoint of feature transformation based on a distribution of input feature tokens. The analysis inspires us to derive a novel transformation method from mean-shift update which is an effective gradient ascent to seek a local mode of distinctive representation on the token distribution. We also present an efficient projection approach to reduce parameter size of linear projections constituting the proposed multi-head feature transformation. In the experiments on ImageNet-1K dataset the proposed methods embedded into various network models exhibit favorable performance improvement in place of the transformer module.

Domain Separation Graph Neural Networks for Saliency Object Ranking
Zijian Wu, Jun Lu, Jing Han, Lianfa Bai, Yi Zhang, Zhuang Zhao, Siyang Song; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 3964-3974
Saliency object ranking (SOR) has attracted significant attention recently. Previous methods usually failed to explicitly explore the saliency degree-related relationships between objects. In this paper we propose a novel Domain Separation Graph Neural Network (DSGNN) which starts with separately extracting the shape and texture cues from each object and builds an shape graph as well as a texture graph for all objects in the given image. Then we propose a Shape-Texture Graph Domain Separation (STGDS) module to separate the task-relevant and irrelevant information of target objects by explicitly modelling the relationship between each pair of objects in terms of their shapes and textures respectively. Furthermore a Cross Image Graph Domain Separation (CIGDS) module is introduced to explore the saliency degree subspace that is robust to different scenes aiming to create a unified representation for targets with the same saliency levels in different images. Importantly our DSGNN automatically learns a multi-dimensional feature to represent each graph edge allowing complex diverse and ranking-related relationships to be modelled. Experimental results show that our DSGNN achieved the new state-of-the-art performance on both ASSR and IRSR datasets with large improvements of 5.2% and 4.1% SA-SOR respectively. Our code is provided in https://github.com/Wu-ZJ/DSGNN.

Mind Marginal Non-Crack Regions: Clustering-Inspired Representation Learning for Crack Segmentation
Zhuangzhuang Chen, Zhuonan Lai, Jie Chen, Jianqiang Li; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 12698-12708
Crack segmentation datasets make great efforts to obtain the ground truth crack or non-crack labels as clearly as possible. However it can be observed that ambiguities are still inevitable when considering the marginal non-crack region due to low contrast and heterogeneous texture. To solve this problem we propose a novel clustering-inspired representation learning framework which contains a two-phase strategy for automatic crack segmentation. In the first phase a pre-process is proposed to localize the marginal non-crack region. Then we propose an ambiguity-aware segmentation loss (Aseg Loss) that enables crack segmentation models to capture ambiguities in the above regions via learning segmentation variance which allows us to further localize ambiguous regions. In the second phase to lea

rn the discriminative features of the above regions we propose a clustering-insp
ired loss (CI Loss) that alters the supervision learning of these regions into a
n unsupervised clustering manner. We demonstrate that the proposed method could
surpass the existing crack segmentation models on various datasets and our const
ructed CrackSeg5k dataset.

FISBe: A Real-World Benchmark Dataset for Instance Segmentation of Long-Range Th
in Filamentous Structures
Lisa Mais, Peter Hirsch, Claire Managan, Ramya Kandarpa, Josef Lorenz Rumberger,
 Annika Reinke, Lena Maier-Hein, Gudrun Ihrke, Dagmar Kainmueller; Proceedings o
f the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 202
4, pp. 22249-22259
Instance segmentation of neurons in volumetric light microscopy images of nervou
s systems enables groundbreaking research in neuroscience by facilitating joint
functional and morphological analyses of neural circuits at cellular resolution.
 Yet said multi-neuron light microscopy data exhibits extremely challenging prop
erties for the task of instance segmentation: Individual neurons have long-rangi
ng thin filamentous and widely branching morphologies multiple neurons are tight
ly inter-weaved and partial volume effects uneven illumination and noise inheren
t to light microscopy severely impede local disentangling as well as long-range
tracing of individual neurons. These properties reflect a current key challenge
in machine learning research namely to effectively capture long-range dependenci
es in the data. While respective methodological research is buzzing to date meth
ods are typically benchmarked on synthetic datasets. To address this gap we rele
ase the FlyLight Instance Segmentation Benchmark (FISBe) dataset the first publi
cly available multi-neuron light microscopy dataset with pixel-wise annotations.
 In addition we define a set of instance segmentation metrics for benchmarking t
hat we designed to be meaningful with regard to downstream analyses. Lastly we p
rovide three baselines to kick off a competition that we envision to both advanc
e the field of machine learning regarding methodology for capturing long-range d
ata dependencies and facilitate scientific discovery in basic neuroscience.

RegionGPT: Towards Region Understanding Vision Language Model
Qiushan Guo, Shalini De Mello, Hongxu Yin, Wonmin Byeon, Ka Chun Cheung, Yizhou
Yu, Ping Luo, Sifei Liu; Proceedings of the IEEE/CVF Conference on Computer Visi
on and Pattern Recognition (CVPR), 2024, pp. 13796-13806
Vision language models (VLMs) have experienced rapid advancements through the in
tegration of large language models (LLMs) with image-text pairs yet they struggl
e with detailed regional visual understanding due to limited spatial awareness o
f the vision encoder and the use of coarse-grained training data that lacks deta
iled region-specific captions. To address this we introduce RegionGPT (short as
RGPT) a novel framework designed for complex region-level captioning and underst
anding. RGPT enhances the spatial awareness of regional representation with simp
le yet effective modifications to existing visual encoders in VLMs. We further i
mprove performance on tasks requiring a specific output scope by integrating tas
k-guided instruction prompts during both training and inference phases while mai
ntaining the model's versatility for general-purpose tasks. Additionally we deve
lop an automated region caption data generation pipeline enriching the training
set with detailed region-level captions. We demonstrate that a universal RGPT mo
del can be effectively applied and significantly enhancing performance across a
range of region-level tasks including but not limited to complex region descript
ions reasoning object classification and referring expressions comprehension.

LL3DA: Visual Interactive Instruction Tuning for Omni-3D Understanding Reasoning
 and Planning
Sijin Chen, Xin Chen, Chi Zhang, Mingsheng Li, Gang Yu, Hao Fei, Hongyuan Zhu, J
iayuan Fan, Tao Chen; Proceedings of the IEEE/CVF Conference on Computer Vision
and Pattern Recognition (CVPR), 2024, pp. 26428-26438
Recent progress in Large Multimodal Models (LMM) has opened up great possibiliti
es for various applications in the field of human-machine interactions. However

developing LMMs that can comprehend reason and plan in complex and diverse 3D environments remains a challenging topic especially considering the demand for understanding permutation-invariant point cloud representations of the 3D scene. Existing works seek help from multi-view images by projecting 2D features to 3D space which inevitably leads to huge computational overhead and performance degradation. In this paper we present LL3DA a Large Language 3D Assistant that takes point cloud as the direct input and responds to both text instructions and visual interactions. The additional visual interaction enables LMMs to better comprehend human interactions with the 3D environment and further remove the ambiguities within plain texts. Experiments show that LL3DA achieves remarkable results and surpasses various 3D vision-language models on both 3D Dense Captioning and 3D Question Answering.

4D Gaussian Splatting for Real-Time Dynamic Scene Rendering

Guanjun Wu, Taoran Yi, Jiemin Fang, Lingxi Xie, Xiaopeng Zhang, Wei Wei, Wenyu Liu, Qi Tian, Xinggang Wang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 20310-20320

Representing and rendering dynamic scenes has been an important but challenging task. Especially to accurately model complex motions high efficiency is usually hard to guarantee. To achieve real-time dynamic scene rendering while also enjoying high training and storage efficiency we propose 4D Gaussian Splatting (4D-GS) as a holistic representation for dynamic scenes rather than applying 3D-GS for each individual frame. In 4D-GS a novel explicit representation containing both 3D Gaussians and 4D neural voxels is proposed. A decomposed neural voxel encoding algorithm inspired by HexPlane is proposed to efficiently build Gaussian features from 4D neural voxels and then a lightweight MLP is applied to predict Gaussian deformations at novel timestamps. Our 4D-GS method achieves real-time rendering under high resolutions 82 FPS at an 800*800 resolution on an RTX 3090 GPU while maintaining comparable or better quality than previous state-of-the-art methods. More demos and code are available at https://guanjunwu.github.io/4dgs.

RAM-Avatar: Real-time Photo-Realistic Avatar from Monocular Videos with Full-body Control

Xiang Deng, Zerong Zheng, Yuxiang Zhang, Jingxiang Sun, Chao Xu, Xiaodong Yang, Lizhen Wang, Yebin Liu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 1996-2007

This paper focuses on advancing the applicability of human avatar learning methods by proposing RAM-Avatar which learns a Real-time photo-realistic Avatar that supports full-body control from Monocular videos. To achieve this goal RAM-Avatar leverages two statistical templates responsible for modeling the facial expression and hand gesture variations while a sparsely computed dual attention module is introduced upon another body template to facilitate high-fidelity texture rendering for the torsos and limbs. Building on this foundation we deploy a lightweight yet powerful StyleUnet along with a temporal-aware discriminator to achieve real-time realistic rendering. To enable robust animation for out-of-distribution poses we propose a Motion Distribution Align module to compensate for the discrepancies between the training and testing motion distribution. Results and extensive experiments conducted in various experimental settings demonstrate the superiority of our proposed method and a real-time live system is proposed to further push research into applications. The training and testing code will be released for research purposes.
****

Selective-Stereo: Adaptive Frequency Information Selection for Stereo Matching

Xianqi Wang, Gangwei Xu, Hao Jia, Xin Yang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 19701-19710

Stereo matching methods based on iterative optimization like RAFT-Stereo and IGEV-Stereo have evolved into a cornerstone in the field of stereo matching. However these methods struggle to simultaneously capture high-frequency information in edges and low-frequency information in smooth regions due to the fixed receptive field. As a result they tend to lose details blur edges and produce false matc

hes in textureless areas. In this paper we propose Selective Recurrent Unit (SRU) a novel iterative update operator for stereo matching. The SRU module can adaptively fuse hidden disparity information at multiple frequencies for edge and smooth regions. To perform adaptive fusion we introduce a new Contextual Spatial Attention (CSA) module to generate attention maps as fusion weights. The SRU empowers the network to aggregate hidden disparity information across multiple frequencies mitigating the risk of vital hidden disparity information loss during iterative processes. To verify SRU's universality we apply it to representative iterative stereo matching methods collectively referred to as Selective-Stereo. Our Selective-Stereo ranks first on KITTI 2012 KITTI 2015 ETH3D and Middlebury leaderboards among all published methods. Code is available at https://github.com/Windsrain/Selective-Stereo.

PerAda: Parameter-Efficient Federated Learning Personalization with Generalization Guarantees
Chulin Xie, De-An Huang, Wenda Chu, Daguang Xu, Chaowei Xiao, Bo Li, Anima Anandkumar; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 23838-23848
Personalized Federated Learning (pFL) has emerged as a promising solution to tackle data heterogeneity across clients in FL. However existing pFL methods either (1) introduce high computation and communication costs or (2) overfit to local data which can be limited in scope and vulnerable to evolved test samples with natural distribution shifts. In this paper we propose PerAda a parameter-efficient pFL framework that reduces communication and computational costs and exhibits superior generalization performance especially under test-time distribution shifts. PerAda reduces the costs by leveraging the power of pretrained models and only updates and communicates a small number of additional parameters from adapters. PerAda achieves high generalization by regularizing each client's personalized adapter with a global adapter while the global adapter uses knowledge distillation to aggregate generalized information from all clients. Theoretically we provide generalization bounds of PerAda and we prove its convergence to stationary points under non-convex settings. Empirically PerAda demonstrates higher personalized performance (+4.85% on CheXpert) and enables better out-of-distribution generalization (+5.23% on CIFAR-10-C) on different datasets across natural and medical domains compared with baselines while only updating 12.6% of parameters per model. Our code is available at https://github.com/NVlabs/PerAda.

MAFA: Managing False Negatives for Vision-Language Pre-training
Jaeseok Byun, Dohoon Kim, Taesup Moon; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 27314-27324
We consider a critical issue of false negatives in Vision- Language Pre-training (VLP) a challenge that arises from the inherent many-to-many correspondence of image-text pairs in large-scale web-crawled datasets. The presence of false negatives can impede achieving optimal performance and even lead to a significant performance drop. To address this challenge we propose MAFA (MAnaging FAlse negatives) which consists of two pivotal components building upon the recently developed GRouped mIni-baTch sampling (GRIT) strategy: 1) an efficient connection mining process that identifies and converts false negatives into positives and 2) label smoothing for the image-text contrastive (ITC) loss. Our comprehensive experiments verify the effectiveness of MAFA across multiple downstream tasks emphasizing the crucial role of addressing false negatives in VLP potentially even surpassing the importance of addressing false posi- tives. In addition the compatibility of MAFA with the recent BLIP-family model is also demonstrated. Code is available at https://github.com/jaeseokbyun/MAFA.

Video Prediction by Modeling Videos as Continuous Multi-Dimensional Processes
Gaurav Shrivastava, Abhinav Shrivastava; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 7236-7245
Diffusion models have made significant strides in image generation mastering tasks such as unconditional image synthesis text-image translation and image-to-ima

ge conversions. However their capability falls short in the realm of video prediction mainly because they treat videos as a collection of independent images relying on external constraints such as temporal attention mechanisms to enforce temporal coherence. In our paper we introduce a novel model class that treats video as a continuous multi-dimensional process rather than a series of discrete frames. Through extensive experimentation we establish state-of-the-art performance in video prediction validated on benchmark datasets including KTH BAIR Human3.6M and UCF101.
****
PICTURE: PhotorealistIC virtual Try-on from UnconstRained dEsigns
Shuliang Ning, Duomin Wang, Yipeng Qin, Zirong Jin, Baoyuan Wang, Xiaoguang Han; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 6976-6985
In this paper we propose a novel virtual try-on from unconstrained designs (ucVTON) task to enable photorealistic synthesis of personalized composite clothing on input human images. Unlike prior arts constrained by specific input types our method allows flexible specification of style (text or image) and texture (full garment cropped sections or texture patches) conditions. To address the entanglement challenge when using full garment images as conditions we develop a two-stage pipeline with explicit disentanglement of style and texture. In the first stage we generate a human parsing map reflecting the desired style conditioned on the input. In the second stage we composite textures onto the parsing map areas based on the texture input. To represent complex and non-stationary textures that have never been achieved in previous fashion editing works we first propose extracting hierarchical and balanced CLIP features and applying position encoding in VTON. Experiments demonstrate superior synthesis quality and personalization enabled by our method. The flexible control over style and texture mixing brings virtual try-on to a new level of user experience for online shopping and fashion design.
****
InfLoRA: Interference-Free Low-Rank Adaptation for Continual Learning
Yan-Shuo Liang, Wu-Jun Li; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 23638-23647
Continual learning requires the model to learn multiple tasks sequentially. In continual learning the model should possess the ability to maintain its performance on old tasks (stability) and the ability to adapt to new tasks continuously (plasticity). Recently parameter-efficient fine-tuning (PEFT) which involves freezing a pre-trained model and injecting a small number of learnable parameters to adapt to downstream tasks has gained increasing popularity in continual learning. Although existing continual learning methods based on PEFT have demonstrated superior performance compared to those not based on PEFT most of them do not consider how to eliminate the interference of the new task on the old tasks which inhibits the model from making a good trade-off between stability and plasticity. In this work we propose a new PEFT method called interference-free low-rank adaptation (InfLoRA) for continual learning. InfLoRA injects a small number of parameters to reparameterize the pre-trained weights and shows that fine-tuning these injected parameters is equivalent to fine-tuning the pre-trained weights within a subspace. Furthermore InfLoRA designs this subspace to eliminate the interference of the new task on the old tasks making a good trade-off between stability and plasticity. Experimental results show that InfLoRA outperforms existing state-of-the-art continual learning methods on multiple datasets.

Towards Robust 3D Pose Transfer with Adversarial Learning
Haoyu Chen, Hao Tang, Ehsan Adeli, Guoying Zhao; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 2295-2304
3D pose transfer that aims to transfer the desired pose to a target mesh is one of the most challenging 3D generation tasks. Previous attempts rely on well-defined parametric human models or skeletal joints as driving pose sources. However to obtain those clean pose sources cumbersome but necessary pre-processing pipelines are inevitable hindering implementations of the real-time applications. Thi

s work is driven by the intuition that the robustness of the model can be enhanced by introducing adversarial samples into the training leading to a more invulnerable model to the noisy inputs which even can be further extended to directly handling the real-world data like raw point clouds/scans without intermediate processing. Furthermore we propose a novel 3D pose Masked Autoencoder (3D-PoseMAE) a customized MAE that effectively learns 3D extrinsic presentations (i.e. pose). 3D-PoseMAE facilitates learning from the aspect of extrinsic attributes by simultaneously generating adversarial samples that perturb the model and learning the arbitrary raw noisy poses via a multi-scale masking strategy. Both qualitative and quantitative studies show that the transferred meshes given by our network result in much better quality. Besides we demonstrate the strong generalizability of our method on various poses different domains and even raw scans. Experimental results also show meaningful insights that the intermediate adversarial samples generated in the training can successfully attack the existing pose transfer models.
****
Error Detection in Egocentric Procedural Task Videos
Shih-Po Lee, Zijia Lu, Zekun Zhang, Minh Hoai, Ehsan Elhamifar; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 18655-18666
We present a new egocentric procedural error dataset containing videos with various types of errors as well as normal videos and propose a new framework for procedural error detection using error-free training videos only. Our framework consists of an action segmentation model and a contrastive step prototype learning module to segment actions and learn useful features for error detection. Based on the observation that interactions between hands and objects often inform action and error understanding we propose to combine holistic frame features with relations features which we learn by building a graph using active object detection followed by a Graph Convolutional Network. To handle errors unseen during training we use our contrastive step prototype learning to learn multiple prototypes for each step capturing variations of error-free step executions. At inference time we use feature-prototype similarities for error detection. By experiments on three datasets we show that our proposed framework outperforms state-of-the-art video anomaly detection methods for error detection and provides smooth action and error predictions.
****
EAGLE: Eigen Aggregation Learning for Object-Centric Unsupervised Semantic Segmentation
Chanyoung Kim, Woojung Han, Dayun Ju, Seong Jae Hwang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 3523-3533
Semantic segmentation has innately relied on extensive pixel-level annotated data leading to the emergence of unsupervised methodologies. Among them leveraging self-supervised Vision Transformers for unsupervised semantic segmentation (USS) has been making steady progress with expressive deep features. Yet for semantically segmenting images with complex objects a predominant challenge remains: the lack of explicit object-level semantic encoding in patch-level features. This technical limitation often leads to inadequate segmentation of complex objects with diverse structures. To address this gap we present a novel approach EAGLE which emphasizes object-centric representation learning for unsupervised semantic segmentation. Specifically we introduce EiCue a spectral technique providing semantic and structural cues through an eigenbasis derived from the semantic similarity matrix of deep image features and color affinity from an image. Further by incorporating our object-centric contrastive loss with EiCue we guide our model to learn object-level representations with intra- and inter-image object-feature consistency thereby enhancing semantic accuracy. Extensive experiments on COCO-Stuff Cityscapes and Potsdam-3 datasets demonstrate the state-of-the-art USS results of EAGLE with accurate and consistent semantic segmentation across complex scenes.
****

AVID: Any-Length Video Inpainting with Diffusion Model
Zhixing Zhang, Bichen Wu, Xiaoyan Wang, Yaqiao Luo, Luxin Zhang, Yinan Zhao, Peter Vajda, Dimitris Metaxas, Licheng Yu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 7162-7172
Recent advances in diffusion models have successfully enabled text-guided image inpainting. While it seems straightforward to extend such editing capability into the video domain there have been fewer works regarding text-guided video inpainting. Given a video a masked region at its initial frame and an editing prompt it requires a model to do infilling at each frame following the editing guidance while keeping the out-of-mask region intact. There are three main challenges in text-guided video inpainting: (i) temporal consistency of the edited video (ii) supporting different inpainting types at different structural fidelity levels and (iii) dealing with variable video length. To address these challenges we introduce Any-Length Video Inpainting with Diffusion Model dubbed as AVID. At its core our model is equipped with effective motion modules and adjustable structure guidance for fixed-length video inpainting. Building on top of that we propose a novel Temporal MultiDiffusion sampling pipeline with a middle-frame attention guidance mechanism facilitating the generation of videos with any desired duration. Our comprehensive experiments show our model can robustly deal with various inpainting types at different video duration ranges with high quality.
****
NoiseCollage: A Layout-Aware Text-to-Image Diffusion Model Based on Noise Cropping and Merging
Takahiro Shirakawa, Seiichi Uchida; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 8921-8930
Layout-aware text-to-image generation is a task to generate multi-object images that reflect layout conditions in addition to text conditions. The current layout-aware text-to-image diffusion models still have several issues including mismatches between the text and layout conditions and quality degradation of generated images. This paper proposes a novel layout-aware text-to-image diffusion model called NoiseCollage to tackle these issues. During the denoising process NoiseCollage independently estimates noises for individual objects and then crops and merges them into a single noise. This operation helps avoid condition mismatches; in other words it can put the right objects in the right places. Qualitative and quantitative evaluations show that NoiseCollage outperforms several state-of-the-art models. These successful results indicate that the crop-and-merge operation of noises is a reasonable strategy to control image generation. We also show that NoiseCollage can be integrated with ControlNet to use edges sketches and pose skeletons as additional conditions. Experimental results show that this integration boosts the layout accuracy of ControlNet. The code is available at https://github.com/univ-esuty/noisecollage.

Uncertainty-Guided Never-Ending Learning to Drive
Lei Lai, Eshed Ohn-Bar, Sanjay Arora, John Seon Keun Yi; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 15088-15098
We present a highly scalable self-training framework for incrementally adapting vision-based end-to-end autonomous driving policies in a semi-supervised manner i.e. over a continual stream of incoming video data. To facilitate large-scale model training (e.g. open web or unlabeled data) we do not assume access to ground-truth labels and instead estimate pseudo-label policy targets for each video. Our framework comprises three key components: knowledge distillation a sample purification module and an exploration and knowledge retention mechanism. First given sequential image frames we pseudo-label the data and estimate uncertainty using an ensemble of inverse dynamics models. The uncertainty is used to select the most informative samples to add to an experience replay buffer. We specifically select high-uncertainty pseudo-labels to facilitate the exploration and learning of new and diverse driving skills. However in contrast to prior work in continual learning that assumes ground-truth labeled samples the uncertain pseudo-labels can introduce significant noise. Thus we also pair the exploration with a la

bel refinement module which makes use of consistency constraints to re-label the
 noisy exploratory samples and effectively learn from diverse data. Trained as a
 complete never-ending learning system we demonstrate state-of-the-art performan
ce on training from domain-changing data as well as millions of images from the
open web.

FakeInversion: Learning to Detect Images from Unseen Text-to-Image Models by Inv
erting Stable Diffusion
George Cazenavette, Avneesh Sud, Thomas Leung, Ben Usman; Proceedings of the IEE
E/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 10
759-10769
Due to the high potential for abuse of GenAI systems the task of detecting synth
etic images has recently become of great interest to the research community. Unf
ortunately existing image space detectors quickly become obsolete as new high-fi
delity text-to-image models are developed at blinding speed. In this work we pro
pose a new synthetic image detector that uses features obtained by inverting an
open-source pre-trained Stable Diffusion model. We show that these inversion fea
tures enable our detector to generalize well to unseen generators of high visual
 fidelity (e.g. DALL*E 3) even when the detector is trained only on lower fideli
ty fake images generated via Stable Diffusion. This detector achieves new state-
of-the-art across multiple training and evaluation setups. Moreover we introduce
 a new challenging evaluation protocol that uses reverse image search to mitigat
e stylistic and thematic biases in the detector evaluation. We show that the res
ulting evaluation scores align well with detectors' in-the-wild performance and
release these datasets as public benchmarks for future research.
****
PLGSLAM: Progressive Neural Scene Represenation with Local to Global Bundle Adju
stment
Tianchen Deng, Guole Shen, Tong Qin, Jianyu Wang, Wentao Zhao, Jingchuan Wang, D
anwei Wang, Weidong Chen; Proceedings of the IEEE/CVF Conference on Computer Vis
ion and Pattern Recognition (CVPR), 2024, pp. 19657-19666
Neural implicit scene representations have recently shown encouraging results in
 dense visual SLAM. However existing methods produce low-quality scene reconstru
ction and low-accuracy localization performance when scaling up to large indoor
scenes and long sequences. These limitations are mainly due to their single glob
al radiance field with finite capacity which does not adapt to large scenarios.
Their end-to-end pose networks are also not robust enough with the growth of cum
ulative errors in large scenes. To this end we introduce PLGSLAM a neural visual
 SLAM system capable of high-fidelity surface reconstruction and robust camera t
racking in real-time. To handle large-scale indoor scenes PLGSLAM proposes a pro
gressive scene representation method which dynamically allocates new local scene
 representation trained with frames within a local sliding window. This allows u
s to scale up to larger indoor scenes and improves robustness (even under pose d
rifts). In local scene representation PLGSLAM utilizes tri-planes for local high
-frequency features with multi-layer perceptron (MLP) networks for the low-frequ
ency feature achieving smoothness and scene completion in unobserved areas. More
over we propose local-to-global bundle adjustment method with a global keyframe
database to address the increased pose drifts on long sequences. Experimental re
sults demonstrate that PLGSLAM achieves state-of-the-art scene reconstruction re
sults and tracking performance across various datasets and scenarios (both in sm
all and large-scale indoor environments).

Multi-Task Dense Prediction via Mixture of Low-Rank Experts
Yuqi Yang, Peng-Tao Jiang, Qibin Hou, Hao Zhang, Jinwei Chen, Bo Li; Proceedings
 of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2
024, pp. 27927-27937
Previous multi-task dense prediction methods based on the Mixture of Experts (Mo
E) have received great performance but they neglect the importance of explicitly
 modeling the global relations among all tasks. In this paper we present a novel
 decoder-focused method for multi-task dense prediction called Mixture-of-Low-Ra

nk-Experts (MLoRE). To model the global task relationships MLoRE adds a generic convolution path to the original MoE structure where each task feature can go through this path for explicit parameter sharing. Furthermore to control the parameters and computational cost brought by the increase in the number of experts we take inspiration from LoRA and propose to leverage the low-rank format of a vanilla convolution in the expert network. Since the low-rank experts have fewer parameters and can be dynamically parameterized into the generic convolution the parameters and computational cost do not change much with the increase of experts. Benefiting from this design we increase the number of experts and its reception field to enlarge the representation capacity facilitating multiple dense tasks learning in a unified network. Extensive experiments on the PASCAL-Context and NYUD-v2 benchmarks show that our MLoRE achieves superior performance compared to previous state-of-the-art methods on all metrics. Our code is available at https://github.com/YuqiYang213/MLoRE.
****
Binding Touch to Everything: Learning Unified Multimodal Tactile Representations
Fengyu Yang, Chao Feng, Ziyang Chen, Hyoungseob Park, Daniel Wang, Yiming Dou, Ziyao Zeng, Xien Chen, Rit Gangopadhyay, Andrew Owens, Alex Wong; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 26340-26353
The ability to associate touch with other modalities has huge implications for humans and computational systems. However multimodal learning with touch remains challenging due to the expensive data collection process and non-standardized sensor outputs. We introduce UniTouch a unified tactile model for vision-based touch sensors connected to multiple modalities including vision language and sound. We achieve this by aligning our UniTouch embeddings to pretrained image embeddings already associated with a variety of other modalities. We further propose learnable sensor-specific tokens allowing the model to learn from a set of heterogeneous tactile sensors all at the same time. UniTouch is capable of conducting various touch sensing tasks in the zero-shot setting from robot grasping prediction to touch image question answering. To the best of our knowledge UniTouch is the first to demonstrate such capabilities.
****
Attribute-Guided Pedestrian Retrieval: Bridging Person Re-ID with Internal Attribute Variability
Yan Huang, Zhang Zhang, Qiang Wu, Yi Zhong, Liang Wang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 17689-17699
In various domains such as surveillance and smart retail pedestrian retrieval centering on person re-identification (Re-ID) plays a pivotal role. Existing Re-ID methodologies often overlook subtle internal attribute variations which are crucial for accurately identifying individuals with changing appearances. In response our paper introduces the Attribute-Guided Pedestrian Retrieval (AGPR) task focusing on integrating specified attributes with query images to refine retrieval results. Although there has been progress in attribute-driven image retrieval there remains a notable gap in effectively blending robust Re-ID models with intra-class attribute variations. To bridge this gap we present the Attribute-Guided Transformer-based Pedestrian Retrieval (ATPR) framework. ATPR adeptly merges global ID recognition with local attribute learning ensuring a cohesive linkage between the two. Furthermore to effectively handle the complexity of attribute interconnectivity ATPR organizes attributes into distinct groups and applies both inter-group correlation and intra-group decorrelation regularizations. Our extensive experiments on a newly established benchmark using the RAP dataset demonstrate the effectiveness of ATPR within the AGPR paradigm.

Text Is MASS: Modeling as Stochastic Embedding for Text-Video Retrieval
Jiamian Wang, Guohao Sun, Pichao Wang, Dongfang Liu, Sohail Dianat, Majid Rabbani, Raghuveer Rao, Zhiqiang Tao; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 16551-16560
The increasing prevalence of video clips has sparked growing interest in text-vi

deo retrieval. Recent advances focus on establishing a joint embedding space for text and video relying on consistent embedding representations to compute similarity. However the text content in existing datasets is generally short and concise making it hard to fully describe the redundant semantics of a video. Correspondingly a single text embedding may be less expressive to capture the video embedding and empower the retrieval. In this study we propose a new stochastic text modeling method T-MASS i.e. text is modeled as a stochastic embedding to enrich text embedding with a flexible and resilient semantic range yielding a text mass. To be specific we introduce a similarity-aware radius module to adapt the scale of the text mass upon the given text-video pairs. Plus we design and develop a support text regularization to further control the text mass during the training. The inference pipeline is also tailored to fully exploit the text mass for accurate retrieval. Empirical evidence suggests that T-MASS not only effectively attracts relevant text-video pairs while distancing irrelevant ones but also enables the determination of precise text embeddings for relevant pairs. Our experimental results show a substantial improvement of T-MASS over baseline (3% 6.3% by R@1). Also T-MASS achieves state-of-the-art performance on five benchmark datasets including MSRVTT LSMDC DiDeMo VATEX and Charades.

Your Transferability Barrier is Fragile: Free-Lunch for Transferring the Non-Transferable Learning
Ziming Hong, Li Shen, Tongliang Liu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 28805-28815
Recently non-transferable learning (NTL) was proposed to restrict models' generalization toward the target domain(s) which serves as state-of-the-art solutions for intellectual property (IP) protection. However the robustness of the established "transferability barrier" for degrading the target domain performance has not been well studied. In this paper we first show that the generalization performance of NTL models is widely impaired on third-party domains (i.e. the unseen domain in the NTL training stage). We explore the impairment patterns and find that: due to the dominant generalization of non-transferable task NTL models tend to make target-domain-consistent predictions on third-party domains even though only a slight distribution shift from the third-party domain to the source domain. Motivated by these findings we uncover the potential risks of NTL by proposing a simple but effective method (dubbed as TransNTL) to recover the target domain performance with few source domain data. Specifically by performing a group of different perturbations on the few source domain data we obtain diverse third-party domains that evoke the same impairment patterns as the unavailable target domain. Then we fine-tune the NTL model under an impairment-repair self-distillation framework where the source-domain predictions are used to teach the model itself how to predict on third-party domains thus repairing the impaired generalization. Empirically experiments on standard NTL benchmarks show that the proposed TransNTL reaches up to 72% target-domain improvements by using only 10% source domain data. Finally we also explore a feasible defense method and empirically demonstrate its effectiveness.

Arbitrary Motion Style Transfer with Multi-condition Motion Latent Diffusion Model
Wenfeng Song, Xingliang Jin, Shuai Li, Chenglizhao Chen, Aimin Hao, Xia Hou, Ning Li, Hong Qin; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 821-830
Computer animation's quest to bridge content and style has historically been a challenging venture with previous efforts often leaning toward one at the expense of the other. This paper tackles the inherent challenge of content-style duality ensuring a harmonious fusion where the core narrative of the content is both preserved and elevated through stylistic enhancements. We propose a novel Multi-condition Motion Latent Diffusion Model (MCM-LDM) for Arbitrary Motion Style Transfer (AMST). Our MCM-LDM significantly emphasizes preserving trajectories recognizing their fundamental role in defining the essence and fluidity of motion content. Our MCM-LDM's cornerstone lies in its ability first to disentangle and then

intricately weave together motion's tripartite components: motion trajectory motion content and motion style. The critical insight of MCM-LDM is to embed multiple conditions with distinct priorities. The content channel serves as the primary flow guiding the overall structure and movement while the trajectory and style channels act as auxiliary components and synchronize with the primary one dynamically. This mechanism ensures that multi-conditions can seamlessly integrate into the main flow enhancing the overall animation without overshadowing the core content. Empirical evaluations underscore the model's proficiency in achieving fluid and authentic motion style transfers setting a new benchmark in the realm of computer animation. The source code and model are available at https://github.com/XingliangJin/MCM-LDM.git.

Know Your Neighbors: Improving Single-View Reconstruction via Spatial Vision-Language Reasoning
Rui Li, Tobias Fischer, Mattia Segu, Marc Pollefeys, Luc Van Gool, Federico Tombari; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 9848-9858
Recovering the 3D scene geometry from a single view is a fundamental yet ill-posed problem in computer vision. While classical depth estimation methods infer only a 2.5D scene representation limited to the image plane recent approaches based on radiance fields reconstruct a full 3D representation. However these methods still struggle with occluded regions since inferring geometry without visual observation requires (i) semantic knowledge of the surroundings and (ii) reasoning about spatial context. We propose KYN a novel method for single-view scene reconstruction that reasons about semantic and spatial context to predict each point's density. We introduce a vision-language modulation module to enrich point features with fine-grained semantic information. We aggregate point representations across the scene through a language-guided spatial attention mechanism to yield per-point density predictions aware of the 3D semantic context. We show that KYN improves 3D shape recovery compared to predicting density for each 3D point in isolation. We achieve state-of-the-art results in scene and object reconstruction on KITTI-360 and show improved zero-shot generalization compared to prior work. Project page: https://ruili3.github.io/kyn

Complementing Event Streams and RGB Frames for Hand Mesh Reconstruction
Jianping Jiang, Xinyu Zhou, Bingxuan Wang, Xiaoming Deng, Chao Xu, Boxin Shi; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 24944-24954
Reliable hand mesh reconstruction (HMR) from commonly-used color and depth sensors is challenging especially under scenarios with varied illuminations and fast motions. Event camera is a highly promising alternative for its high dynamic range and dense temporal resolution properties but it lacks key texture appearance for hand mesh reconstruction. In this paper we propose EvRGBHand -- the first approach for 3D hand mesh reconstruction with an event camera and an RGB camera compensating for each other. By fusing two modalities of data across time space and information dimensionsEvRGBHand can tackle overexposure and motion blur issues in RGB-based HMR and foreground scarcity and background overflow issues in event-based HMR. We further propose EvRGBDegrader which allows our model to generalize effectively in challenging scenes even when trained solely on standard scenes thus reducing data acquisition costs. Experiments on real-world data demonstrate that EvRGBHand can effectively solve the challenging issues when using either type of camera alone via retaining the merits of both and shows the potential of generalization to outdoor scenes and another type of event camera. Our code models and dataset will be made public after acceptance.

Empowering Resampling Operation for Ultra-High-Definition Image Enhancement with Model-Aware Guidance
Wei Yu, Jie Huang, Bing Li, Kaiwen Zheng, Qi Zhu, Man Zhou, Feng Zhao; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 25722-25731

Image enhancement algorithms have made remarkable advancements in recent years but directly applying them to Ultra-high-definition (UHD) images presents intractable computational overheads. Therefore previous straightforward solutions employ resampling techniques to reduce the resolution by adopting a "Downsampling-Enhancement-Upsampling" processing paradigm. However this paradigm disentangles the resampling operators and inner enhancement algorithms which results in the loss of information that is favored by the model further leading to sub-optimal outcomes. In this paper we propose a novel method of Learning Model-Aware Resampling (LMAR) which learns to customize resampling by extracting model-aware information from the UHD input image under the guidance of model knowledge. Specifically our method consists of two core designs namely compensatory kernel estimation and steganographic resampling. At the first stage we dynamically predict compensatory kernels tailored to the specific input and resampling scales. At the second stage the image-wise compensatory information is derived with the compensatory kernels and embedded into the rescaled input images. This promotes the representation of the newly derived downscaled inputs to be more consistent with the full-resolution UHD inputs as perceived by the model. Our LMAR enables model-aware and model-favored resampling while maintaining compatibility with existing resampling operators. Extensive experiments on multiple UHD image enhancement datasets and different backbones have shown consistent performance gains after correlating resizer and enhancer e.g. up to 1.2dB PSNR gain for x1.8 resampling scale on UHD-LOL4K. The code is available at \href https://github.com/YPatrickW/LMAR https://github.com/YPatrickW/LMAR .

ViT-CoMer: Vision Transformer with Convolutional Multi-scale Feature Interaction for Dense Predictions
Chunlong Xia, Xinliang Wang, Feng Lv, Xin Hao, Yifeng Shi; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 5493-5502
Although Vision Transformer (ViT) has achieved significant success in computer vision it does not perform well in dense prediction tasks due to the lack of inner-patch information interaction and the limited diversity of feature scale. Most existing studies are devoted to designing vision-specific transformers to solve the above problems which introduce additional pre-training costs. Therefore we present a plain pre-training-free and feature-enhanced ViT backbone with Convolutional Multi-scale feature interaction named ViT-CoMer which facilitates bidirectional interaction between CNN and transformer. Compared to the state-of-the-art ViT-CoMer has the following advantages: (1) We inject spatial pyramid multi-receptive field convolutional features into the ViT architecture which effectively alleviates the problems of limited local information interaction and single-feature representation in ViT. (2) We propose a simple and efficient CNN-Transformer bidirectional fusion interaction module that performs multi-scale fusion across hierarchical features which is beneficial for handling dense prediction tasks. (3) We evaluate the performance of ViT-CoMer across various dense prediction tasks different frameworks and multiple advanced pre-training. Notably our ViT-CoMer-L achieves 64.3% AP on COCO val2017 without extra training data and 62.1% mIoU on ADE20K val both of which are comparable to state-of-the-art methods. We hope ViT-CoMer can serve as a new backbone for dense prediction tasks to facilitate future research. The code will be released at https://github.com/Traffic-X/ViT-CoMer.

PromptCoT: Align Prompt Distribution via Adapted Chain-of-Thought
Junyi Yao, Yijiang Liu, Zhen Dong, Mingfei Guo, Helan Hu, Kurt Keutzer, Li Du, Daquan Zhou, Shanghang Zhang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 7027-7037
Diffusion-based generative models have exhibited remarkable capability in the production of high-fidelity visual content such as images and videos. However their performance is significantly contingent upon the quality of textual inputs commonly referred to as "prompts". The process of traditional prompt engineering while effective necessitates empirical expertise and poses challenges for inexperi

enced users. In this paper we introduce PromptCoT an innovative enhancer that au tonomously refines prompts for users. PromptCoT is designed based on the observa tion that prompts which resemble the textual information of high-quality images in the training set often lead to superior generation performance. Therefore we fine-tune the pre-trained Large Language Models (LLM) using a curated text datas et that solely comprises descriptions of high-quality visual content. By doing s o the LLM can capture the distribution of high-quality training texts enabling i t to generate aligned continuations and revisions to boost the original texts. N onetheless one drawback of pre-trained LLMs is their tendency to generate extran eous or irrelevant information. We employ the Chain-of-Thought (CoT) mechanism t o improve the alignment between the original text prompts and their refined vers ions. CoT can extract and amalgamate crucial information from the aligned contin uation and revision enabling reasonable inferences based on the contextual cues to produce a more comprehensive and nuanced final output. Considering computatio nal efficiency instead of allocating a dedicated LLM for prompt enhancement to e ach individual model or dataset we integrate adapters that facilitate dataset-sp ecific adaptation leveraging a shared pre-trained LLM as the foundation for this process. With independent fine-tuning of these adapters we can adapt PromptCoT to new datasets while minimally increasing training costs and memory usage. We e valuate the effectiveness of PromptCoT by assessing its performance on widely-us ed latent diffusion models for image and video generation. The results demonstra te significant improvements in key performance metrics.

Hallucination Augmented Contrastive Learning for Multimodal Large Language Model
Chaoya Jiang, Haiyang Xu, Mengfan Dong, Jiaxing Chen, Wei Ye, Ming Yan, Qinghao Ye, Ji Zhang, Fei Huang, Shikun Zhang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 27036-27046
Multi-modal large language models (MLLMs) have been shown to efficiently integra te natural language with visual information to handle multi-modal tasks. However MLLMs still face a fundamental limitation of hallucinations where they tend to generate erroneous or fabricated information. In this paper we address hallucina tions in MLLMs from a novel perspective of representation learning. We first ana lyzed the representation distribution of textual and visual tokens in MLLM revea ling two important findings: 1) there is a significant gap between textual and v isual representations indicating unsatisfactory cross-modal representation align ment; 2) representations of texts that contain and do not contain hallucinations are entangled making it challenging to distinguish them. These two observations inspire us with a simple yet effective method to mitigate hallucinations. Speci fically we introduce contrastive learning into MLLMs and use text with hallucina tion as hard negative examples naturally bringing representations of non-halluci native text and visual samples closer while pushing way representations of non-h allucinating and hallucinative text. We evaluate our method quantitatively and q ualitatively showing its effectiveness in reducing hallucination occurrences and improving performance across multiple benchmarks. On the MMhal-Bench benchmark our method obtains a 34.66% /29.5% improvement over the baseline MiniGPT-4/LLaVA . Our code is available on https://github.com/X-PLUG/mPLUG-HalOwl/tree/main/hacl .

Preserving Fairness Generalization in Deepfake Detection
Li Lin, Xinan He, Yan Ju, Xin Wang, Feng Ding, Shu Hu; Proceedings of the IEEE/C VF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 16815 -16825
Although effective deepfake detection models have been developed in recent years recent studies have revealed that these models can result in unfair performance disparities among demographic groups such as race and gender. This can lead to particular groups facing unfair targeting or exclusion from detection potentiall y allowing misclassified deepfakes to manipulate public opinion and undermine tr ust in the model. The existing method for addressing this problem is providing a fair loss function. It shows good fairness performance for intra-domain evaluat ion but does not maintain fairness for cross-domain testing. This highlights the

significance of fairness generalization in the fight against deepfakes. In this work we propose the first method to address the fairness generalization problem in deepfake detection by simultaneously considering features loss and optimization aspects. Our method employs disentanglement learning to extract demographic and domain-agnostic forgery features fusing them to encourage fair learning across a flattened loss landscape. Extensive experiments on prominent deepfake datasets demonstrate our method's effectiveness surpassing state-of-the-art approaches in preserving fairness during cross-domain deepfake detection. The code is available at https://github.com/Purdue-M2/Fairness-Generalization.

Anomaly Score: Evaluating Generative Models and Individual Generated Images based on Complexity and Vulnerability
Jaehui Hwang, Junghyuk Lee, Jong-Seok Lee; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 8754-8763
With the advancement of generative models the assessment of generated images becomes increasingly more important. Previous methods measure distances between features of reference and generated images from trained vision models. In this paper we conduct an extensive investigation into the relationship between the representation space and input space around generated images. We first propose two measures related to the presence of unnatural elements within images: complexity which indicates how non-linear the representation space is and vulnerability which is related to how easily the extracted feature changes by adversarial input changes. Based on these we introduce a new metric to evaluating image-generative models called anomaly score (AS). Moreover we propose AS-i (anomaly score for individual images) that can effectively evaluate generated images individually. Experimental results demonstrate the validity of the proposed approach.

Structure-Aware Sparse-View X-ray 3D Reconstruction
Yuanhao Cai, Jiahao Wang, Alan Yuille, Zongwei Zhou, Angtian Wang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 11174-11183
X-ray known for its ability to reveal internal structures of objects is expected to provide richer information for 3D reconstruction than visible light. Yet existing NeRF algorithms overlook this nature of X-ray leading to their limitations in capturing structural contents of imaged objects. In this paper we propose a framework Structure-Aware X-ray Neural Radiodensity Fields (SAX-NeRF) for sparse-view X-ray 3D reconstruction. Firstly we design a Line Segment-based Transformer (Lineformer) as the backbone of SAX-NeRF. Linefomer captures internal structures of objects in 3D space by modeling the dependencies within each line segment of an X-ray. Secondly we present a Masked Local-Global (MLG) ray sampling strategy to extract contextual and geometric information in 2D projection. Plus we collect a larger-scale dataset X3D covering wider X-ray applications. Experiments on X3D show that SAX-NeRF surpasses previous NeRF-based methods by 12.56 and 2.49 dB on novel view synthesis and CT reconstruction. https://github.com/caiyuanhao1998/SAX-NeRF

Dexterous Grasp Transformer
Guo-Hao Xu, Yi-Lin Wei, Dian Zheng, Xiao-Ming Wu, Wei-Shi Zheng; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 17933-17942
In this work we propose a novel discriminative framework for dexterous grasp generation named Dexterous Grasp TRansformer (DGTR) capable of predicting a diverse set of feasible grasp poses by processing the object point cloud with only one forward pass. We formulate dexterous grasp generation as a set prediction task and design a transformer-based grasping model for it. However we identify that this set prediction paradigm encounters several optimization challenges in the field of dexterous grasping and results in restricted performance. To address these issues we propose progressive strategies for both the training and testing phases. First the dynamic-static matching training (DSMT) strategy is presented to enhance the optimization stability during the training phase. Second we introduce

the adversarial-balanced test-time adaptation (AB-TTA) with a pair of adversarial losses to improve grasping quality during the testing phase. Experimental results on the DexGraspNet dataset demonstrate the capability of DGTR to predict dexterous grasp poses with both high quality and diversity. Notably while keeping high quality the diversity of grasp poses predicted by DGTR significantly outperforms previous works in multiple metrics without any data pre-processing. Codes are available at https://github.com/iSEE-Laboratory/DGTR.

Cooperation Does Matter: Exploring Multi-Order Bilateral Relations for Audio-Visual Segmentation
Qi Yang, Xing Nie, Tong Li, Pengfei Gao, Ying Guo, Cheng Zhen, Pengfei Yan, Shiming Xiang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 27134-27143
Recently an audio-visual segmentation (AVS) task has been introduced aiming to group pixels with sounding objects within a given video. This task necessitates a first-ever audio-driven pixel-level understanding of the scene posing significant challenges. In this paper we propose an innovative audio-visual transformer framework termed COMBO an acronym for COoperation of Multi-order Bilateral relatiOns. For the first time our framework explores three types of bilateral entanglements within AVS: pixel entanglement modality entanglement and temporal entanglement. Regarding pixel entanglement we employ a Siam-Encoder Module (SEM) that leverages prior knowledge to generate more precise visual features from the foundational model. For modality entanglement we design a Bilateral-Fusion Module (BFM) enabling COMBO to align corresponding visual and auditory signals bi-directionally. As for temporal entanglement we introduce an innovative adaptive inter-frame consistency loss according to the inherent rules of temporal. Comprehensive experiments and ablation studies on AVSBench-object (84.7 mIoU on S4 59.2 mIou on MS3) and AVSBench-semantic (42.1 mIoU on AVSS) datasets demonstrate that COMBO surpasses previous state-of-the-art methods. Project page is available at https://yannqi.github.io/AVS-COMBO.

EgoThink: Evaluating First-Person Perspective Thinking Capability of Vision-Language Models
Sijie Cheng, Zhicheng Guo, Jingwen Wu, Kechen Fang, Peng Li, Huaping Liu, Yang Liu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 14291-14302
Vision-language models (VLMs) have recently shown promising results in traditional downstream tasks. Evaluation studies have emerged to assess their abilities with the majority focusing on the third-person perspective and only a few addressing specific tasks from the first-person perspective. However the capability of VLMs to "think" from a first-person perspective a crucial attribute for advancing autonomous agents and robotics remains largely unexplored. To bridge this research gap we introduce EgoThink a novel visual question-answering benchmark that encompasses six core capabilities with twelve detailed dimensions. The benchmark is constructed using selected clips from egocentric videos with manually annotated question-answer pairs containing first-person information. To comprehensively assess VLMs we evaluate twenty-one popular VLMs on EgoThink. Moreover given the open-ended format of the answers we use GPT-4 as the automatic judge to compute single-answer grading. Experimental results indicate that although GPT-4V leads in numerous dimensions all evaluated VLMs still possess considerable potential for improvement in first-person perspective tasks. Meanwhile enlarging the number of trainable parameters has the most significant impact on model performance on EgoThink. In conclusion EgoThink serves as a valuable addition to existing evaluation benchmarks for VLMs providing an indispensable resource for future research in the realm of embodied artificial intelligence and robotics.

Hearing Anything Anywhere
Mason Long Wang, Ryosuke Sawata, Samuel Clarke, Ruohan Gao, Shangzhe Wu, Jiajun Wu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 11790-11799

Recent years have seen immense progress in 3D computer vision and computer graph
ics with emerging tools that can virtualize real-world 3D environments for numer
ous Mixed Reality (XR) applications. However alongside immersive visual experien
ces immersive auditory experiences are equally vital to our holistic perception
of an environment. In this paper we aim to reconstruct the spatial acoustic char
acteristics of an arbitrary environment given only a sparse set of (roughly 12)
room impulse response (RIR) recordings and a planar reconstruction of the scene
a setup that is easily achievable by ordinary users. To this end we introduce Di
ffRIR a differentiable RIR rendering framework with interpretable parametric mod
els of salient acoustic features of the scene including sound source directivity
 and surface reflectivity. This allows us to synthesize novel auditory experienc
es through the space with any source audio. To evaluate our method we collect a
dataset of RIR recordings and music in four diverse real environments. We show t
hat our model outperforms state-of-the-art baselines on rendering monaural and b
inaural RIRs and music at unseen locations and learns physically interpretable p
arameters characterizing acoustic properties of the sound source and surfaces in
 the scene.

PatchFusion: An End-to-End Tile-Based Framework for High-Resolution Monocular Me
tric Depth Estimation
Zhenyu Li, Shariq Farooq Bhat, Peter Wonka; Proceedings of the IEEE/CVF Conferen
ce on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 10016-10025
Single image depth estimation is a foundational task in computer vision and gene
rative modeling. However prevailing depth estimation models grapple with accommo
dating the increasing resolutions commonplace in today's consumer cameras and de
vices. Existing high-resolution strategies show promise but they often face limi
tations ranging from error propagation to the loss of high-frequency details. We
 present PatchFusion a novel tile-based framework with three key components to i
mprove the current state of the art: (1) A patch-wise fusion network that fuses
a globally-consistent coarse prediction with finer inconsistent tiled prediction
s via high-level feature guidance (2) A Global-to-Local (G2L) module that adds v
ital context to the fusion network discarding the need for patch selection heuri
stics and (3) A Consistency-Aware Training (CAT) and Inference (CAI) approach em
phasizing patch overlap consistency and thereby eradicating the necessity for po
st-processing. Experiments on UnrealStereo4K MVS-Synth and Middleburry 2014 demo
nstrate that our framework can generate high-resolution depth maps with intricat
e details. PatchFusion is independent of the base model for depth estimation. No
tably our framework built on top of SOTA ZoeDepth brings improvements for a tota
l of 17.3% and 29.4% in terms of the root mean squared error (RMSE) on UnrealSte
reo4K and MVS-Synth respectively.

GeneAvatar: Generic Expression-Aware Volumetric Head Avatar Editing from a Singl
e Image
Chong Bao, Yinda Zhang, Yuan Li, Xiyu Zhang, Bangbang Yang, Hujun Bao, Marc Poll
efeys, Guofeng Zhang, Zhaopeng Cui; Proceedings of the IEEE/CVF Conference on Co
mputer Vision and Pattern Recognition (CVPR), 2024, pp. 8952-8963
Recently we have witnessed the explosive growth of various volumetric representa
tions in modeling animatable head avatars. However due to the diversity of frame
works there is no practical method to support high-level applications like 3D he
ad avatar editing across different representations. In this paper we propose a g
eneric avatar editing approach that can be universally applied to various 3DMM d
riving volumetric head avatars. To achieve this goal we design a novel expressio
n-aware modification generative model which enables lift 2D editing from a singl
e image to a consistent 3D modification field. To ensure the effectiveness of th
e generative modification process we develop several techniques including an exp
ression-dependent modification distillation scheme to draw knowledge from the la
rge-scale head avatar model and 2D facial texture editing tools implicit latent
space guidance to enhance model convergence and a segmentation-based loss reweig
ht strategy for fine-grained texture inversion. Extensive experiments demonstrat
e that our method delivers high-quality and consistent results across multiple e

xpression and viewpoints. Project page: https://zju3dv.github.io/ geneavatar/.

Improved Self-Training for Test-Time Adaptation
Jing Ma; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern R ecognition (CVPR), 2024, pp. 23701-23710
Test-time adaptation (TTA) is a technique to improve the performance of a pre-tr ained source model on a target distribution without using any labeled data. Howe ver existing self-trained TTA methods often face the challenges of unreliable ps eudo-labels and unstable model optimization. In this paper we propose an Improve d Self-Training (IST) approach which addresses these challenges by enhancing the pseudo-label quality and stabilizing the adaptation process. Specifically we us e a simple augmentation strategy to generate multiple views of each test sample and construct a graph structure to correct the pseudo-labels based on the simila rity of the latent features. Moreover we adopt a parameter moving average scheme to smooth the model updates and prevent catastrophic forgetting. Instead of usi ng a model with fixed label space we explore the adaptability of the foundation model CLIP to various downstream tasks at test time. Extensive experiments on va rious benchmarks show that IST can achieve significant and consistent improvemen ts over the existing TTA methods in classification detection and segmentation ta sks.

Learn to Rectify the Bias of CLIP for Unsupervised Semantic Segmentation
Jingyun Wang, Guoliang Kang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 4102-4112
Recent works utilize CLIP to perform the challenging unsupervised semantic segme ntation task where only images without annotations are available. However we obs erve that when adopting CLIP to such a pixel-level understanding task unexpected bias occurs. Previous works don't explicitly model such bias which largely cons trains the segmentation performance. In this paper we propose to explicitly mode l and rectify the bias existing in CLIP to facilitate the unsupervised semantic segmentation. Specifically we design a learnable "Reference" prompt to encode cl ass-preference bias and project the positional embedding of vision transformer t o represent space-preference bias. Via a simple element-wise subtraction we rect ify the logits of CLIP classifier. Based on the rectified logits we generate a s egmentation mask via a Gumbel-Softmax operation. Then a contrastive loss between masked visual feature and the text features of different classes is imposed to facilitate the effective bias modeling. To further improve the segmentation we d istill the knowledge from the rectified CLIP to the advanced segmentation archit ecture via minimizing our designed mask-guided feature-guided and text-guided lo ss terms. Extensive experiments on standard benchmarks demonstrate that our meth od performs favorably against previous state-of-the-arts. The implementation is available at https://github.com/dogehhh/ReCLIP.

Unsupervised Feature Learning with Emergent Data-Driven Prototypicality
Yunhui Guo, Youren Zhang, Yubei Chen, Stella X. Yu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 23199-23 208
Given a set of images our goal is to map each image to a point in a feature spac e such that not only point proximity indicates visual similarity but where it is located directly encodes how prototypical the image is according to the dataset . Our key insight is to perform unsupervised feature learning in hyperbolic inst ead of Euclidean space where the distance between points still reflects image si milarity yet we gain additional capacity for representing prototypicality with t he location of the point: The closer it is to the origin the more prototypical i t is. The latter property is simply emergent from optimizing the metric learning objective: The image similar to many training instances is best placed at the c enter of corresponding points in Euclidean space but closer to the origin in hyp erbolic space. We propose an unsupervised feature learning algorithm in Hyperbol ic space with sphere pACKing. HACK first generates uniformly packed particles in the Poincar'e ball of hyperbolic space and then assigns each image uniquely to

a particle. With our feature mapper simply trained to spread out training instances in hyperbolic space we observe that images move closer to the origin with congealing - a warping process that aligns all the images and makes them appear more common and similar to each other validating our idea of unsupervised prototypicality discovery. We demonstrate that our data-driven prototypicality provides an easy and superior unsupervised instance selection to reduce sample complexity increase model generalization with atypical instances and robustness with typical ones.

Unlocking Pre-trained Image Backbones for Semantic Image Synthesis
Tariq Berrada Ifriqi, Jakob Verbeek, Camille Couprie, Karteek Alahari; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 7840-7849
Semantic image synthesis i.e. generating images from user-provided semantic label maps is an important conditional image generation task as it allows to control both the content as well as the spatial layout of generated images. Although diffusion models have pushed the state of the art in generative image modeling the iterative nature of their inference process makes them computationally demanding. Other approaches such as GANs are more efficient as they only need a single feed-forward pass for generation but the image quality tends to suffer when modeling large and diverse datasets. In this work we propose a new class of GAN discriminators for semantic image synthesis that generates highly realistic images by exploiting feature backbones pre-trained for tasks such as image classification. We also introduce a new generator architecture with better context modeling and using cross-attention to inject noise into latent variables leading to more diverse generated images. Our model which we dub DP-SIMS achieves state-of-the-art results in terms of image quality and consistency with the input label maps on ADE-20K COCO-Stuff and Cityscapes surpassing recent diffusion models while requiring two orders of magnitude less compute for inference.

Retrieval-Augmented Egocentric Video Captioning
Jilan Xu, Yifei Huang, Junlin Hou, Guo Chen, Yuejie Zhang, Rui Feng, Weidi Xie; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 13525-13536
Understanding human actions from videos of first-person view poses significant challenges. Most prior approaches explore representation learning on egocentric videos only while overlooking the potential benefit of exploiting existing large-scale third-person videos. In this paper (1) we develop EgoInstructor a retrieval-augmented multimodal captioning model that automatically retrieves semantically relevant third-person instructional videos to enhance the video captioning of egocentric videos (2) for training the cross-view retrieval module we devise an automatic pipeline to discover ego-exo video pairs from distinct large-scale egocentric and exocentric datasets (3) we train the cross-view retrieval module with a novel EgoExoNCE loss that pulls egocentric and exocentric video features closer by aligning them to shared text features that describe similar actions (4) through extensive experiments our cross-view retrieval module demonstrates superior performance across seven benchmarks. Regarding egocentric video captioning EgoInstructor exhibits significant improvements by leveraging third-person videos as references.

SkillDiffuser: Interpretable Hierarchical Planning via Skill Abstractions in Diffusion-Based Task Execution
Zhixuan Liang, Yao Mu, Hengbo Ma, Masayoshi Tomizuka, Mingyu Ding, Ping Luo; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 16467-16476
Diffusion models have demonstrated strong potential for robotic trajectory planning. However generating coherent trajectories from high-level instructions remains challenging especially for long-range composition tasks requiring multiple sequential skills. We propose SkillDiffuser an end-to-end hierarchical planning framework integrating interpretable skill learning with conditional diffusion plan

ning to address this problem. At the higher level the skill abstraction module learns discrete human-understandable skill representations from visual observations and language instructions. These learned skill embeddings are then used to condition the diffusion model to generate customized latent trajectories aligned with the skills. This allows generating diverse state trajectories that adhere to the learnable skills. By integrating skill learning with conditional trajectory generation SkillDiffuser produces coherent behavior following abstract instructions across diverse tasks. Experiments on multi-task robotic manipulation benchmarks like Meta-World and LOReL demonstrate state-of-the-art performance and human-interpretable skill representations from SkillDiffuser. More visualization results and information could be found on https://skilldiffuser.github.io/.

Improving Generalized Zero-Shot Learning by Exploring the Diverse Semantics from External Class Names
Yapeng Li, Yong Luo, Zengmao Wang, Bo Du; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 23344-23353
Generalized Zero-Shot Learning (GZSL) methods often assume that the unseen classes are similar to seen classes and thus perform poor when unseen classes are dissimilar to seen classes. Although some existing GZSL approaches can alleviate this issue by leveraging additional semantic information from test unseen classes their generalization ability to dissimilar unseen classes is still unsatisfactory. This motivates us to study GZSL in the more practical setting where unseen classes can be either similar or dissimilar to seen classes. In this paper we propose a simple yet effective GZSL framework by exploring diverse semantics from external class names (DSECN) which is simultaneously robust on the similar and dissimilar unseen classes. This is achieved by introducing diverse semantics from external class names and aligning the introduced semantics to visual space using the classification head of pre-trained network. Furthermore we show that the design idea of DSECN can easily be integrate into other advanced GZSL approaches such as the generative-based ones and enhance their robustness for dissimilar unseen classes. Extensive experiments in the practical setting including both similar and dissimilar unseen classes show that our method significantly outperforms the state-of-the-art approaches on all datasets and can be trained very efficiently.

TeMO: Towards Text-Driven 3D Stylization for Multi-Object Meshes
Xuying Zhang, Bo-Wen Yin, Yuming Chen, Zheng Lin, Yunheng Li, Qibin Hou, Ming-Ming Cheng; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 19531-19540
Recent progress in the text-driven 3D stylization of a single object has been considerably promoted by CLIP-based methods. However the stylization of multi-object 3D scenes is still impeded in that the image-text pairs used for pre-training CLIP mostly consist of an object. Meanwhile the local details of multiple objects may be susceptible to omission due to the existing supervision manner primarily relying on coarse-grained contrast of image-text pairs. To overcome these challenges we present a novel framework dubbed TeMO to parse multi-object 3D scenes and edit their styles under the contrast supervision at multiple levels. We first propose a Decoupled Graph Attention (DGA) module to distinguishably reinforce the features of 3D surface points. Particularly a cross-modal graph is constructed to align the object points accurately and noun phrases decoupled from the 3D mesh and textual description. Then we develop a Cross-Grained Contrast (CGC) supervision system where a fine-grained loss between the words in the textual description and the randomly rendered images are constructed to complement the coarse-grained loss. Extensive experiments show that our method can synthesize high-quality stylized content and outperform the existing methods over a wide range of multi-object 3D meshes.

TE-TAD: Towards Full End-to-End Temporal Action Detection via Time-Aligned Coordinate Expression
Ho-Joong Kim, Jung-Ho Hong, Heejo Kong, Seong-Whan Lee; Proceedings of the IEEE/

CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 18837-18846
In this paper we investigate that the normalized coordinate expression is a key factor as reliance on hand-crafted components in query-based detectors for temporal action detection (TAD). Despite significant advancements towards an end-to-end framework in object detection query-based detectors have been limited in achieving full end-to-end modeling in TAD. To address this issue we propose TE-TAD a full end-to-end temporal action detection transformer that integrates time-aligned coordinate expression. We reformulate coordinate expression utilizing actual timeline values ensuring length-invariant representations from the extremely diverse video duration environment. Furthermore our proposed adaptive query selection dynamically adjusts the number of queries based on video length providing a suitable solution for varying video durations compared to a fixed query set. Our approach not only simplifies the TAD process by eliminating the need for hand-crafted components but also significantly improves the performance of query-based detectors. Our TE-TAD outperforms the previous query-based detectors and achieves competitive performance compared to state-of-the-art methods on popular benchmark datasets. Code is available at: https://github.com/Dotori-HJ/TE-TAD.

GSNeRF: Generalizable Semantic Neural Radiance Fields with Enhanced 3D Scene Understanding
Zi-Ting Chou, Sheng-Yu Huang, I-Jieh Liu, Yu-Chiang Frank Wang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 20806-20815
Utilizing multi-view inputs to synthesize novel-view images Neural Radiance Fields (NeRF) have emerged as a popular research topic in 3D vision. In this work we introduce a Generalizable Semantic Neural Radiance Field (GSNeRF) which uniquely takes image semantics into the synthesis process so that both novel view images and the associated semantic maps can be produced for unseen scenes. Our GSNeRF is composed of two stages: Semantic Geo-Reasoning and Depth-Guided Visual rendering. The former is able to observe multi-view image inputs to extract semantic and geometry features from a scene. Guided by the resulting image geometry information the latter performs both image and semantic rendering with improved performances. Our experiments not only confirm that GSNeRF performs favorably against prior works on both novel-view image and semantic segmentation synthesis but the effectiveness of our sampling strategy for visual rendering is further verified.
****
Alpha Invariance: On Inverse Scaling Between Distance and Volume Density in Neural Radiance Fields
Joshua Ahn, Haochen Wang, Raymond A. Yeh, Greg Shakhnarovich; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 20396-20405
Scale-ambiguity in 3D scene dimensions leads to magnitude-ambiguity of volumetric densities in neural radiance fields i.e. the densities double when scene size is halved and vice versa. We call this property alpha invariance. For NeRFs to better maintain alpha invariance we recommend 1) parameterizing both distance and volume densities in log space and 2) a discretization-agnostic initialization strategy to guarantee high ray transmittance. We revisit a few popular radiance field models and find that these systems use various heuristics to deal with issues arising from scene scaling. We test their behaviors and show our recipe to be more robust.
****
TexTile: A Differentiable Metric for Texture Tileability
Carlos Rodriguez-Pardo, Dan Casas, Elena Garces, Jorge Lopez-Moreno; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 4439-4449
We introduce TexTile a novel differentiable metric to quantify the degree upon which a texture image can be concatenated with itself without introducing repeating artifacts (i.e. the tileability). Existing methods for tileable texture synth

esis focus on general texture quality but lack explicit analysis of the intrinsi
c repeatability properties of a texture. In contrast our TexTile metric effectiv
ely evaluates the tileable properties of a texture opening the door to more info
rmed synthesis and analysis of tileable textures. Under the hood TexTile is form
ulated as a binary classifier carefully built from a large dataset of textures o
f different styles semantics regularities and human annotations.Key to our metho
d is a set of architectural modifications to baseline pre-train image classifier
s to overcome their shortcomings at measuring tileability along with a custom da
ta augmentation and training regime aimed at increasing robustness and accuracy.
 We demonstrate that TexTile can be plugged into different state-of-the-art text
ure synthesis methods including diffusion-based strategies and generate tileable
 textures while keeping or even improving the overall texture quality. Furthermo
re we show that TexTile can objectively evaluate any tileable texture synthesis
method whereas the current mix of existing metrics produces uncorrelated scores
which heavily hinders progress in the field.

D3T: Distinctive Dual-Domain Teacher Zigzagging Across RGB-Thermal Gap for Domai
n-Adaptive Object Detection
Dinh Phat Do, Taehoon Kim, Jaemin Na, Jiwon Kim, Keonho Lee, Kyunghwan Cho, Wonj
un Hwang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern
Recognition (CVPR), 2024, pp. 23313-23322
Domain adaptation for object detection typically entails transferring knowledge
from one visible domain to another visible domain. However there are limited stu
dies on adapting from the visible to the thermal domain because the domain gap b
etween the visible and thermal domains is much larger than expected and traditio
nal domain adaptation can not successfully facilitate learning in this situation
. To overcome this challenge we propose a Distinctive Dual-Domain Teacher (D3T)
framework that employs distinct training paradigms for each domain. Specifically
 we segregate the source and target training sets for building dual-teachers and
 successively deploy exponential moving average to the student model to individu
al teachers of each domain. The framework further incorporates a zigzag learning
 method between dual teachers facilitating a gradual transition from the visible
 to thermal domains during training. We validate the superiority of our method t
hrough newly designed experimental protocols with well-known thermal datasets i.
e. FLIR and KAIST. Source code is available at https://github.com/EdwardDo69/D3T

Positive-Unlabeled Learning by Latent Group-Aware Meta Disambiguation
Lin Long, Haobo Wang, Zhijie Jiang, Lei Feng, Chang Yao, Gang Chen, Junbo Zhao;
Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognitio
n (CVPR), 2024, pp. 23138-23147
Positive-Unlabeled (PU) learning aims to train a binary classifier using minimal
 positive data supplemented by a substantially larger pool of unlabeled data in
the specific absence of explicitly annotated negatives. Despite its straightforw
ard nature as a binary classification task the currently best-performing PU algo
rithms still largely lag behind the supervised counterpart. In this work we iden
tify that the primary bottleneck lies in the difficulty of deriving discriminati
ve representations under unreliable binary supervision with poor semantics which
 subsequently hinders the common label disambiguation procedures. To cope with t
his problem we propose a novel PU learning framework namely Latent Group-Aware M
eta Disambiguation (LaGAM) which incorporates a hierarchical contrastive learnin
g module to extract the underlying grouping semantics within PU data and produce
 compact representations. As a result LaGAM enables a more aggressive label disa
mbiguation strategy where we enhance the robustness of training by iteratively d
istilling the true labels of unlabeled data directly through meta-learning. Exte
nsive experiments show that LaGAM significantly outperforms the current state-of
-the-art methods by an average of 6.8% accuracy on common benchmarks approaching
 the supervised baseline. We also provide comprehensive ablations as well as vis
ualized analysis to verify the effectiveness of our LaGAM.

Improving Image Restoration through Removing Degradations in Textual Representations
Jingbo Lin, Zhilu Zhang, Yuxiang Wei, Dongwei Ren, Dongsheng Jiang, Qi Tian, Wangmeng Zuo; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 2866-2878
In this paper we introduce a new perspective for improving image restoration by removing degradation in the textual representations of a given degraded image. Intuitively restoration is much easier on text modality than image one. For example it can be easily conducted by removing degradation-related words while keeping the content-aware words. Hence we combine the advantages of images in detail description and ones of text in degradation removal to perform restoration. To address the cross-modal assistance we propose to map the degraded images into textual representations for removing the degradations and then convert the restored textual representations into a guidance image for assisting image restoration. In particular We ingeniously embed an image-to-text mapper and text restoration module into CLIP-equipped text-to-image models to generate the guidance. Then we adopt a simple coarse-to-fine approach to dynamically inject multi-scale information from guidance to image restoration networks. Extensive experiments are conducted on various image restoration tasks including deblurring dehazing deraining and denoising and all-in-one image restoration. The results showcase that our method outperforms state-of-the-art ones across all these tasks. The codes and models are available at https://github.com/mrluin/TextualDegRemoval.

ZONE: Zero-Shot Instruction-Guided Local Editing
Shanglin Li, Bohan Zeng, Yutang Feng, Sicheng Gao, Xiuhui Liu, Jiaming Liu, Lin Li, Xu Tang, Yao Hu, Jianzhuang Liu, Baochang Zhang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 6254-6263
Recent advances in vision-language models like Stable Diffusion have shown remarkable power in creative image synthesis and editing.However most existing text-to-image editing methods encounter two obstacles: First the text prompt needs to be carefully crafted to achieve good results which is not intuitive or user-friendly. Second they are insensitive to local edits and can irreversibly affect non-edited regions leaving obvious editing traces. To tackle these problems we propose a Zero-shot instructiON-guided local image Editing approach termed ZONE. We first convert the editing intent from the user-provided instruction (e.g. "make his tie blue") into specific image editing regions through InstructPix2Pix. We then propose a Region-IoU scheme for precise image layer extraction from an off-the-shelf segment model. We further develop an edge smoother based on FFT for seamless blending between the layer and the image.Our method allows for arbitrary manipulation of a specific region with a single instruction while preserving the rest. Extensive experiments demonstrate that our ZONE achieves remarkable local editing results and user-friendliness outperforming state-of-the-art methods. Code is available at https://github.com/lsl001006/ZONE.

U-VAP: User-specified Visual Appearance Personalization via Decoupled Self Augmentation
You Wu, Kean Liu, Xiaoyue Mi, Fan Tang, Juan Cao, Jintao Li; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 9482-9491
Concept personalization methods enable large text-to-image models to learn specific subjects (e.g. objects/poses/3D models) and synthesize renditions in new contexts. Given that the image references are highly biased towards visual attributes state-of-the-art personalization models tend to overfit the whole subject and cannot disentangle visual characteristics in pixel space. In this study we proposed a more challenging setting namely fine-grained visual appearance personalization. Different from existing methods we allow users to provide a sentence describing the desired attributes. A novel decoupled self-augmentation strategy is proposed to generate target-related and non-target samples to learn user-specified visual attributes.These augmented data allow for refining the model's understa

nding of the target attribute while mitigating the impact of unrelated attribute s. At the inference stage adjustments are conducted on semantic space through th e learned target and non-target embeddings to further enhance the disentanglemen t of target attributes. Extensive experiments on various kinds of visual attribu tes with SOTA personalization methods shows the ability of the proposed method t o mimic target visual appearance in novel contexts thus improving the controllab ility and flexibility of personalization.

PointBeV: A Sparse Approach for BeV Predictions
Loick Chambon, Eloi Zablocki, Mickaël Chen, Florent Bartoccioni, Patrick Pérez, Matthieu Cord; Proceedings of the IEEE/CVF Conference on Computer Vision and Pat tern Recognition (CVPR), 2024, pp. 15195-15204
Bird's-eye View (BeV) representations have emerged as the de-facto shared space in driving applications offering a unified space for sensor data fusion and supp orting various downstream tasks. However conventional models use grids with fixe d resolution and range and face computational inefficiencies due to the uniform allocation of resources across all cells. To address this we propose PointBeV a novel sparse BeV segmentation model operating on sparse BeV cells instead of den se grids. This approach offers precise control over memory usage enabling the us e of long temporal contexts and accommodating memory-constrained platforms. Poin tBeV employs an efficient two-pass strategy for training enabling focused comput ation on regions of interest. At inference time it can be used with various memo ry/performance trade-offs and flexibly adjusts to new specific use cases. PointB eV achieves state-of-the-art results on the nuScenes dataset for vehicle pedestr ian and lane segmentation showcasing superior performance in static and temporal settings despite being trained solely with sparse signals. We release our code with two new efficient modules used in the architecture: Sparse Feature Pulling designed for the effective extraction of features from images to BeV and Submani fold Attention which enables efficient temporal modeling. The code is available at https://github.com/valeoai/PointBeV.

From-Ground-To-Objects: Coarse-to-Fine Self-supervised Monocular Depth Estimatio n of Dynamic Objects with Ground Contact Prior
Jaeho Moon, Juan Luis Gonzalez Bello, Byeongjun Kwon, Munchurl Kim; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 20 24, pp. 10519-10529
Self-supervised monocular depth estimation (DE) is an approach to learning depth without costly depth ground truths. However it often struggles with moving obje cts that violate the static scene assumption during training. To address this is sue we introduce a coarse-to-fine training strategy leveraging the ground contac ting prior based on the observation that most moving objects in outdoor scenes c ontact the ground. In the coarse training stage we exclude the objects in dynami c classes from the reprojection loss calculation to avoid inaccurate depth learn ing. To provide precise supervision on the depth of the objects we present a nov el Ground-contacting-prior Disparity Smoothness Loss (GDS-Loss) that encourages a DE network to align the depth of the objects with their ground-contacting poin ts. Subsequently in the fine training stage we refine the DE network to learn th e detailed depth of the objects from the reprojection loss while ensuring accura te DE on the moving object regions by employing our regularization loss with a c ost-volume-based weighting factor. Our overall coarse-to-fine training strategy can easily be integrated with existing DE methods without any modifications sign ificantly enhancing DE performance on challenging Cityscapes and KITTI datasets especially in the moving object regions.

Linguistic-Aware Patch Slimming Framework for Fine-grained Cross-Modal Alignment
Zheren Fu, Lei Zhang, Hou Xia, Zhendong Mao; Proceedings of the IEEE/CVF Confere nce on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 26307-26316
Cross-modal alignment aims to build a bridge connecting vision and language. It is an important multi-modal task that efficiently learns the semantic similariti es between images and texts. Traditional fine-grained alignment methods heavily

rely on pre-trained object detectors to extract region features for subsequent r
egion-word alignment thereby incurring substantial computational costs for regio
n detection and error propagation issues for two-stage training. In this paper w
e focus on the mainstream vision transformer incorporating patch features for pa
tch-word alignment while addressing the resultant issue of visual patch redundan
cy and patch ambiguity for semantic alignment. We propose a novel Linguistic-Awa
re Patch Slimming (LAPS) framework for fine-grained alignment which explicitly i
dentifies redundant visual patches with language supervision and rectifies their
 semantic and spatial information to facilitate more effective and consistent pa
tch-word alignment. Extensive experiments on various evaluation benchmarks and m
odel backbones show LAPS outperforms the state-of-the-art fine-grained alignment
 methods by 5%-15% rSum. Our code is available at https://github.com/CrossmodalG
roup/LAPS

HHMR: Holistic Hand Mesh Recovery by Enhancing the Multimodal Controllability of
 Graph Diffusion Models
Mengcheng Li, Hongwen Zhang, Yuxiang Zhang, Ruizhi Shao, Tao Yu, Yebin Liu; Proc
eedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (C
VPR), 2024, pp. 645-654
Recent years have witnessed a trend of the deep integration of the generation an
d reconstruction paradigms. In this paper we extend the ability of controllable
generative models for a more comprehensive hand mesh recovery task: direct hand
mesh generation inpainting reconstruction and fitting in a single framework whic
h we name as Holistic Hand Mesh Recovery (HHMR). Our key observation is that dif
ferent kinds of hand mesh recovery tasks can be achieved by a single generative
model with strong multimodal controllability and in such a framework realizing d
ifferent tasks only requires giving different signals as conditions. To achieve
this goal we propose an all-in-one diffusion framework based on graph convolutio
n and attention mechanisms for holistic hand mesh recovery. In order to achieve
strong control generation capability while ensuring the decoupling of multimodal
 control signals we map different modalities to a share feature space and apply
cross-scale random masking in both modality and feature levels. In this way the
correlation between different modalities can be fully exploited during the learn
ing of hand priors. Furthermore we propose Condition-aligned Gradient Guidance t
o enhance the alignment of the generated model with the control signals which si
gnificantly improves the accuracy of the hand mesh reconstruction and fitting. E
xperiments show that our novel framework can realize multiple hand mesh recovery
 tasks simultaneously and outperform the existing methods in different tasks whi
ch provides more possibilities for subsequent downstream applications including
gesture recognition pose generation mesh editing and so on.

SRTube: Video-Language Pre-Training with Action-Centric Video Tube Features and
Semantic Role Labeling
Ju-Hee Lee, Je-Won Kang; Proceedings of the IEEE/CVF Conference on Computer Visi
on and Pattern Recognition (CVPR), 2024, pp. 13689-13699
In recent years large-scale video-language pre-training (VidLP) has received con
siderable attention for its effectiveness in relevant tasks. In this paper we pr
opose a novel action-centric VidLP framework that employs video tube features fo
r temporal modeling and language features based on semantic role labeling (SRL).
 Our video encoder generates multiple tube features along object trajectories id
entifying action-related regions within videos to overcome the limitations of ex
isting temporal attention mechanisms. Additionally our text encoder incorporates
 high-level action-related language knowledge previously underutilized in curren
t VidLP models. The SRL captures action-verbs and related semantics among object
s in sentences and enhances the ability to perform instance-level text matching
thus enriching the cross-modal (CM) alignment process. We also introduce two nov
el pre-training objectives and a self-supervision strategy to produce a more fai
thful CM representation. Experimental results demonstrate that our method outper
forms existing VidLP frameworks in various downstream tasks and datasets establi
shing our model a baseline in the modern VidLP framework.

Prompt Highlighter: Interactive Control for Multi-Modal LLMs
Yuechen Zhang, Shengju Qian, Bohao Peng, Shu Liu, Jiaya Jia; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 13215-13224
This study targets a critical aspect of multi-modal LLMs' (LLMs&VLMs) inference: explicit controllable text generation. Multi-modal LLMs empower multi-modality understanding with the capability of semantic generation yet bring less explainability and heavier reliance on prompt contents due to their autoregressive generative nature. While manipulating prompt formats could improve outputs designing specific and precise prompts per task can be challenging and ineffective. To tackle this issue we introduce a novel inference method Prompt Highlighter which enables users to highlight specific prompt spans to interactively control the focus during generation. Motivated by the classifier-free diffusion guidance we form regular and unconditional context pairs based on highlighted tokens demonstrating that the autoregressive generation in models can be guided in a classifier-free way. Notably we find that during inference guiding the models with highlighted tokens through the attention weights leads to more desired outputs. Our approach is compatible with current LLMs and VLMs achieving impressive customized generation results without training. Experiments confirm its effectiveness in focusing on input contexts and generating reliable content. Without tuning on LLaVA-v1.5 our method secured 70.7 in the MMBench test and 1552.5 in MME-perception.
****
Domain-Rectifying Adapter for Cross-Domain Few-Shot Segmentation
Jiapeng Su, Qi Fan, Wenjie Pei, Guangming Lu, Fanglin Chen; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 24036-24045
Few-shot semantic segmentation (FSS) has achieved great success on segmenting objects of novel classes supported by only a few annotated samples. However existing FSS methods often underperform in the presence of domain shifts especially when encountering new domain styles that are unseen during training. It is suboptimal to directly adapt or generalize the entire model to new domains in the few-shot scenario. Instead our key idea is to adapt a small adapter for rectifying diverse target domain styles to the source domain. Consequently the rectified target domain features can fittingly benefit from the well-optimized source domain segmentation model which is intently trained on sufficient source domain data. Training domain-rectifying adapter requires sufficiently diverse target domains. We thus propose a novel local-global style perturbation method to simulate diverse potential target domains by perturbating the feature channel statistics of the individual images and collective statistics of the entire source domain respectively. Additionally we propose a cyclic domain alignment module to facilitate the adapter effectively rectifying domains using a reverse domain rectification supervision. The adapter is trained to rectify the image features from diverse synthesized target domains to align with the source domain. During testing on target domains we start by rectifying the image features and then conduct few-shot segmentation on the domain-rectified features. Extensive experiments demonstrate the effectiveness of our method achieving promising results on cross-domain few-shot semantic segmentation tasks. Our code is available at https://github.com/Matt-Su/DR-Adapter.

Robust Self-calibration of Focal Lengths from the Fundamental Matrix
Viktor Kocur, Daniel Kyselica, Zuzana Kukelova; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 5220-5229
The problem of self-calibration of two cameras from a given fundamental matrix is one of the basic problems in geometric computer vision. Under the assumption of known principal points and square pixels the Bougnoux formula offers a means to compute the two unknown focal lengths. However in many practical situations the formula yields inaccurate results due to commonly occurring singularities. Moreover the estimates are sensitive to noise in the computed fundamental matrix and to the assumed positions of the principal points. In this paper we therefore p

ropose an efficient and robust iterative method to estimate the focal lengths al
ong with the principal points of the cameras given a fundamental matrix and prio
rs for the estimated camera intrinsics. In addition we study a computationally e
fficient check of models generated within RANSAC that improves the accuracy of t
he estimated models while reducing the total computational time. Extensive exper
iments on real and synthetic data show that our iterative method brings signific
ant improvements in terms of the accuracy of the estimated focal lengths over th
e Bougnoux formula and other state-of-the-art methods even when relying on inacc
urate priors. The code for the methods and experiments is available at https://g
ithub.com/kocurvik/robust_self_calibration

Continual Learning for Motion Prediction Model via Meta-Representation Learning
and Optimal Memory Buffer Retention Strategy
DaeJun Kang, Dongsuk Kum, Sanmin Kim; Proceedings of the IEEE/CVF Conference on
Computer Vision and Pattern Recognition (CVPR), 2024, pp. 15438-15448
Embodied AI such as autonomous vehicles suffers from insufficient long-tailed da
ta because it must be obtained from the physical world. In fact data must be con
tinuously obtained in a series of small batches and the model must also be conti
nuously trained to achieve generalizability and scalability by improving the bia
sed data distribution. This paper addresses the training cost and catastrophic f
orgetting problems when continuously updating models to adapt to incoming small
batches from various environments for real-world motion prediction in autonomous
 driving. To this end we propose a novel continual motion prediction (CMP) learn
ing framework based on sparse meta-representation learning and an optimal memory
 buffer retention strategy. In meta-representation learning a model explicitly l
earns a sparse representation of each driving environment from road geometry to
vehicle states by training to reduce catastrophic forgetting based on an augment
ed modulation network with sparsity regularization. Also in the adaptation phase
 We develop an Optimal Memory Buffer Retention strategy that smartly preserves d
iverse samples by focusing on representation similarity. This approach handles t
he nuanced task distribution shifts characteristic of motion prediction datasets
 ensuring our model stays responsive to evolving input variations without requir
ing extensive resources. The experiment results demonstrate that the proposed me
thod shows superior adaptation performance to the conventional continual learnin
g approach which is developed using a synthetic dataset for the continual learni
ng problem.

PartDistill: 3D Shape Part Segmentation by Vision-Language Model Distillation
Ardian Umam, Cheng-Kun Yang, Min-Hung Chen, Jen-Hui Chuang, Yen-Yu Lin; Proceedi
ngs of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR)
, 2024, pp. 3470-3479
This paper proposes a cross-modal distillation framework PartDistill which trans
fers 2D knowledge from vision-language models (VLMs) to facilitate 3D shape part
 segmentation. PartDistill addresses three major challenges in this task: the la
ck of 3D segmentation in invisible or undetected regions in the 2D projections i
nconsistent 2D predictions by VLMs and the lack of knowledge accumulation across
 different 3D shapes. PartDistill consists of a teacher network that uses a VLM
to make 2D predictions and a student network that learns from the 2D predictions
 while extracting geometrical features from multiple 3D shapes to carry out 3D p
art segmentation. A bi-directional distillation including forward and backward d
istillations is carried out within the framework where the former forward distil
ls the 2D predictions to the student network and the latter improves the quality
 of the 2D predictions which subsequently enhances the final 3D segmentation. Mo
reover PartDistill can exploit generative models that facilitate effortless 3D s
hape creation for generating knowledge sources to be distilled. Through extensiv
e experiments PartDistill boosts the existing methods with substantial margins o
n widely used ShapeNetPart and PartNetE datasets by more than 15% and 12% higher
 mIoU scores respectively. The code for this work is available at https://github
.com/ardianumam/PartDistill.

CPP-Net: Embracing Multi-Scale Feature Fusion into Deep Unfolding CP-PPA Network for Compressive Sensing

Zhen Guo, Hongping Gan; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 25086-25095

In the domain of compressive sensing (CS) deep unfolding networks (DUNs) have garnered attention for their good performance and certain degree of interpretability rooted in CS domain achieved by marrying traditional optimization solvers with deep networks. However current DUNs are ill-suited for the intricate task of capturing fine-grained image details leading to perceptible distortions and blurriness in reconstructed images particularly at low CS ratios e.g. 0.10 and below. In this paper we propose CPP-Net a novel deep unfolding CS framework inspired by the primal-dual hybrid strategy of the Chambolle and Pock Proximal Point Algorithm (CP-PPA). First we derive three iteration submodules Xk Vk and Yk by incorporating customized deep learning modules to solve the sparse basis related proximal operator within CP-PPA. Second we design the Dual Path Fusion Block (DPFB) to adeptly extract and fuse multi-scale feature information enhancing sensitivity to feature information at different scales and improving detail reconstruction. Third we introduce the Iteration Fusion Strategy (IFS) to effectively weight the fusion of outputs from diverse reconstruction stages maximizing the utilization of feature information and mitigating the information loss during reconstruction stages. Extensive experiments demonstrate that CPP-Net effectively reduces distortion and blurriness while preserving richer image details outperforming current state-of-the-art methods. Codes are available at https://github.com/ICSResearch/CPP-Net.

EditGuard: Versatile Image Watermarking for Tamper Localization and Copyright Protection

Xuanyu Zhang, Runyi Li, Jiwen Yu, Youmin Xu, Weiqi Li, Jian Zhang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 11964-11974

In the era of AI-generated content (AIGC) malicious tampering poses imminent threats to copyright integrity and information security. Current deep image watermarking while widely accepted for safeguarding visual content can only protect copyright and ensure traceability. They fall short in localizing increasingly realistic image tampering potentially leading to trust crises privacy violations and legal disputes. To solve this challenge we propose an innovative proactive forensics framework EditGuard to unify copyright protection and tamper-agnostic localization especially for AIGC-based editing methods. It can offer a meticulous embedding of imperceptible watermarks and precise decoding of tampered areas and copyright information. Leveraging our observed fragility and locality of image-into-image steganography the realization of EditGuard can be converted into a united image-bit steganography issue thus completely decoupling the training process from the tampering types. Extensive experiments verify that our EditGuard balances the tamper localization accuracy copyright recovery precision and generalizability to various AIGC-based tampering methods especially for image forgery that is difficult for the naked eye to detect.

3DGStream: On-the-Fly Training of 3D Gaussians for Efficient Streaming of Photo-Realistic Free-Viewpoint Videos

Jiakai Sun, Han Jiao, Guangyuan Li, Zhanjie Zhang, Lei Zhao, Wei Xing; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 20675-20685

Constructing photo-realistic Free-Viewpoint Videos (FVVs) of dynamic scenes from multi-view videos remains a challenging endeavor. Despite the remarkable advancements achieved by current neural rendering techniques these methods generally require complete video sequences for offline training and are not capable of real-time rendering. To address these constraints we introduce 3DGStream a method designed for efficient FVV streaming of real-world dynamic scenes. Our method achieves fast on-the-fly per-frame reconstruction within 12 seconds and real-time rendering at 200 FPS. Specifically we utilize 3D Gaussians (3DGs) to represent the

scene. Instead of the naive approach of directly optimizing 3DGs per-frame we employ a compact Neural Transformation Cache (NTC) to model the translations and rotations of 3DGs markedly reducing the training time and storage required for each FVV frame. Furthermore we propose an adaptive 3DG addition strategy to handle emerging objects in dynamic scenes. Experiments demonstrate that 3DGStream achieves competitive performance in terms of rendering speed image quality training time and model storage when compared with state-of-the-art methods.

FairRAG: Fair Human Generation via Fair Retrieval Augmentation
Robik Shrestha, Yang Zou, Qiuyu Chen, Zhiheng Li, Yusheng Xie, Siqi Deng; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 11996-12005
Existing text-to-image generative models reflect or even amplify societal biases ingrained in their training data. This is especially concerning for human image generation where models are biased against certain demographic groups. Existing attempts to rectify this issue are hindered by the inherent limitations of the pre-trained models and fail to substantially improve demographic diversity. In this work we introduce Fair Retrieval Augmented Generation (FairRAG) a novel framework that conditions pre-trained generative models on reference images retrieved from an external image database to improve fairness in human generation. FairRAG enables conditioning through a lightweight linear module that projects reference images into the textual space. To enhance fairness FairRAG applies simple-yet-effective debiasing strategies providing images from diverse demographic groups during the generative process. Extensive experiments demonstrate that FairRAG outperforms existing methods in terms of demographic diversity image-text alignment and image fidelity while incurring minimal computational overhead during inference.

DragDiffusion: Harnessing Diffusion Models for Interactive Point-based Image Editing
Yujun Shi, Chuhui Xue, Jun Hao Liew, Jiachun Pan, Hanshu Yan, Wenqing Zhang, Vincent Y. F. Tan, Song Bai; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 8839-8849
Accurate and controllable image editing is a challenging task that has attracted significant attention recently. Notably DragGAN developed by Pan et al. (2023) is an interactive point-based image editing framework that achieves impressive editing results with pixel-level precision. However due to its reliance on generative adversarial networks (GANs) its generality is limited by the capacity of pretrained GAN models. In this work we extend this editing framework to diffusion models and propose a novel approach DragDiffusion. By harnessing large-scale pretrained diffusion models we greatly enhance the applicability of interactive point-based editing on both real and diffusion-generated images. Unlike other diffusion-based editing methods that provide guidance on diffusion latents of multiple time steps our approach achieves efficient yet accurate spatial control by optimizing the latent of only one time step. This novel design is motivated by our observations that UNet features at a specific time step provides sufficient semantic and geometric information to support the drag-based editing. Moreover we introduce two additional techniques namely identity-preserving fine-tuning and reference-latent-control to further preserve the identity of the original image. Lastly we present a challenging benchmark dataset called DragBench---the first benchmark to evaluate the performance of interactive point-based image editing methods. Experiments across a wide range of challenging cases (e.g. images with multiple objects diverse object categories various styles etc.) demonstrate the versatility and generality of DragDiffusion. Code and the DragBench dataset: https://github.com/Yujun-Shi/DragDiffusion.

FaceTalk: Audio-Driven Motion Diffusion for Neural Parametric Head Models
Shivangi Aneja, Justus Thies, Angela Dai, Matthias Nießner; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 21263-21273

We introduce FaceTalk a novel generative approach designed for synthesizing high
-fidelity 3D motion sequences of talking human heads from input audio signal. To
 capture the expressive detailed nature of human heads including hair ears and f
iner-scale eye movements we propose to couple speech signal with the latent spac
e of neural parametric head models to create high-fidelity temporally coherent m
otion sequences. We propose a new latent diffusion model for this task operating
 in the expression space of neural parametric head models to synthesize audio-dr
iven realistic head sequences. In the absence of a dataset with corresponding NP
HM expressions to audio we optimize for these correspondences to produce a datas
et of temporally-optimized NPHM expressions fit to audio-video recordings of peo
ple talking. To the best of our knowledge this is the first work to propose a ge
nerative approach for realistic and high-quality motion synthesis of volumetric
human heads representing a significant advancement in the field of audio-driven
3D animation. Notably our approach stands out in its ability to generate plausib
le motion sequences that can produce high-fidelity head animation coupled with t
he NPHM shape space. Our experimental results substantiate the effectiveness of
FaceTalk consistently achieving superior and visually natural motion encompassin
g diverse facial expressions and styles outperforming existing methods by 75% in
 perceptual user study evaluation

Mip-Splatting: Alias-free 3D Gaussian Splatting
Zehao Yu, Anpei Chen, Binbin Huang, Torsten Sattler, Andreas Geiger; Proceedings
 of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2
024, pp. 19447-19456
Recently 3D Gaussian Splatting has demonstrated impressive novel view synthesis
results reaching high fidelity and efficiency. However strong artifacts can be o
bserved when changing the sampling rate e.g. by changing focal length or camera
distance. We find that the source for this phenomenon can be attributed to the l
ack of 3D frequency constraints and the usage of a 2D dilation filter. To addres
s this problem we introduce a 3D smoothing filter to constrains the size of the
3D Gaussian primitives based on the maximal sampling frequency induced by the in
put views. It eliminates high-frequency artifacts when zooming in. Moreover repl
acing 2D dilation with a 2D Mip filter which simulates a 2D box filter effective
ly mitigates aliasing and dilation issues. Our evaluation including scenarios su
ch a training on single-scale images and testing on multiple scales validates th
e effectiveness of our approach.

Learning Coupled Dictionaries from Unpaired Data for Image Super-Resolution
Longguang Wang, Juncheng Li, Yingqian Wang, Qingyong Hu, Yulan Guo; Proceedings
of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 20
24, pp. 25712-25721
The difficulty of acquiring high-resolution (HR) and low-resolution (LR) image p
airs in real scenarios limits the performance of existing learning-based image s
uper-resolution (SR) methods in the real world. To conduct training on real-worl
d unpaired data current methods focus on synthesizing pseudo LR images to associ
ate unpaired images. However the realness and diversity of pseudo LR images are
vulnerable due to the large image space. In this paper we circumvent the difficu
lty of image generation and propose an alternative to build the connection betwe
en unpaired images in a compact proxy space. Specifically we first construct cou
pled HR and LR dictionaries and then encode HR and LR images into a common laten
t code space using these dictionaries. In addition we develop an autoencoder-bas
ed framework to couple these dictionaries during optimization by reconstructing
input HR and LR images. The coupled dictionaries enable our method to employ a s
hallow network architecture with only 18 layers to achieve efficient image SR. E
xtensive experiments show that our method (DictSR) can effectively model the LR-
to-HR mapping in coupled dictionaries and produces state-of-the-art performance
on benchmark datasets.

Template Free Reconstruction of Human-object Interaction with Procedural Interac
tion Generation

Xianghui Xie, Bharat Lal Bhatnagar, Jan Eric Lenssen, Gerard Pons-Moll; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 10003-10015
Reconstructing human-object interaction in 3D from a single RGB image is a challenging task and existing data driven methods do not generalize beyond the objects present in the carefully curated 3D interaction datasets. Capturing large-scale real data to learn strong interaction and 3D shape priors is very expensive due to the combinatorial nature of human-object interactions. In this paper we propose ProciGen (Procedural interaction Generation) a method to procedurally generate datasets with both plausible interaction and diverse object variation. We generate 1M+ human-object interaction pairs in 3D and leverage this large-scale data to train our HDM (Hierarchical Diffusion Model) a novel method to reconstruct interacting human and unseen object instances without any templates. Our HDM is an image-conditioned diffusion model that learns both realistic interaction and highly accurate human and object shapes. Experiments show that our HDM trained with ProciGen significantly outperforms prior methods that require template meshes and our dataset allows training methods with strong generalization ability to unseen object instances. Our code and data are released.

Deep Video Inverse Tone Mapping Based on Temporal Clues
Yuyao Ye, Ning Zhang, Yang Zhao, Hongbin Cao, Ronggang Wang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 25995-26004
Inverse tone mapping (ITM) aims to reconstruct high dynamic range (HDR) radiance from low dynamic range (LDR) content. Although many deep image ITM methods can generate impressive results the field of video ITM is still to be explored. Processing video sequences by image ITM methods may cause temporal inconsistency. Besides they aren't able to exploit the potentially useful information in the temporal domain. In this paper we analyze the process of video filming and then propose a Global Sample and Local Propagate strategy to better find and utilize temporal clues. To better realize the proposed strategy we design a two-stage pipeline which includes modules named Incremental Clue Aggregation Module and Feature and Clue Propagation Module. They can align and fuse frames effectively under the condition of brightness changes and propagate features and temporal clues to all frames efficiently. Our temporal clues based video ITM method can recover realistic and temporal consistent results with high fidelity in over-exposed regions. Qualitative and quantitative experiments on public datasets show that the proposed method has significant advantages over existing methods.

NeRF-HuGS: Improved Neural Radiance Fields in Non-static Scenes Using Heuristics-Guided Segmentation
Jiahao Chen, Yipeng Qin, Lingjie Liu, Jiangbo Lu, Guanbin Li; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 19436-19446
Neural Radiance Field (NeRF) has been widely recognized for its excellence in novel view synthesis and 3D scene reconstruction. However their effectiveness is inherently tied to the assumption of static scenes rendering them susceptible to undesirable artifacts when confronted with transient distractors such as moving objects or shadows. In this work we propose a novel paradigm namely "Heuristics-Guided Segmentation" (HuGS) which significantly enhances the separation of static scenes from transient distractors by harmoniously combining the strengths of hand-crafted heuristics and state-of-the-art segmentation models thus significantly transcending the limitations of previous solutions. Furthermore we delve into the meticulous design of heuristics introducing a seamless fusion of Structure-from-Motion (SfM)-based heuristics and color residual heuristics catering to a diverse range of texture profiles. Extensive experiments demonstrate the superiority and robustness of our method in mitigating transient distractors for NeRFs trained in non-static scenes. Project page: https://cnhaox.github.io/NeRF-HuGS/

Addressing Background Context Bias in Few-Shot Segmentation through Iterative Mo

dulation
Lanyun Zhu, Tianrun Chen, Jianxiong Yin, Simon See, Jun Liu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 3370-3379
Existing few-shot segmentation methods usually extract foreground prototypes from support images to guide query image segmentation. However different background contexts of support and query images can cause their foreground features to be misaligned. This phenomenon known as background context bias can hinder the effectiveness of support prototypes in guiding query image segmentation. In this work we propose a novel framework with an iterative structure to address this problem. In each iteration of the framework we first generate a query prediction based on a support foreground feature. Next we extract background context from the query image to modulate the support foreground feature thus eliminating the foreground feature misalignment caused by the different backgrounds. After that we design a confidence-biased attention to eliminate noise and cleanse information. By integrating these components through an iterative structure we create a novel network that can leverage the synergies between different modules to improve their performance in a mutually reinforcing manner. Through these carefully designed components and structures our network can effectively eliminate background context bias in few-shot segmentation thus achieving outstanding performance. We conduct extensive experiments on the PASCAL-5^ i and COCO-20^ i datasets and achieve state-of-the-art (SOTA) results which demonstrate the effectiveness of our approach.

Open-Vocabulary Video Anomaly Detection
Peng Wu, Xuerong Zhou, Guansong Pang, Yujia Sun, Jing Liu, Peng Wang, Yanning Zhang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 18297-18307
Current video anomaly detection (VAD) approaches with weak supervisions are inherently limited to a closed-set setting and may struggle in open-world applications where there can be anomaly categories in the test data unseen during training. A few recent studies attempt to tackle a more realistic setting open-set VAD which aims to detect unseen anomalies given seen anomalies and normal videos. However such a setting focuses on predicting frame anomaly scores having no ability to recognize the specific categories of anomalies despite the fact that this ability is essential for building more informed video surveillance systems. This paper takes a step further and explores open-vocabulary video anomaly detection (OVVAD) in which we aim to leverage pre-trained large models to detect and categorize seen and unseen anomalies. To this end we propose a model that decouples OVVAD into two mutually complementary tasks - class-agnostic detection and class-specific classification - and jointly optimizes both tasks. Particularly we devise a semantic knowledge injection module to introduce semantic knowledge from large language models for the detection task and design a novel anomaly synthesis module to generate pseudo unseen anomaly videos with the help of large vision generation models for the classification task. These semantic knowledge and synthesis anomalies substantially extend our model's capability in detecting and categorizing a variety of seen and unseen anomalies. Extensive experiments on three widely-used benchmarks demonstrate our model achieves state-of-the-art performance on OVVAD task.

ODM: A Text-Image Further Alignment Pre-training Approach for Scene Text Detection and Spotting
Chen Duan, Pei Fu, Shan Guo, Qianyi Jiang, Xiaoming Wei; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 15587-15597
Abstract In recent years text-image joint pre-training techniques have shown promising results in various tasks. However in Optical Character Recognition (OCR) tasks aligning text instances with their corresponding text regions in images poses a challenge as it requires effective alignment between text and OCR-Text (referring to the text in images as OCR-Text to distinguish from the text in natura

l language) rather than a holistic understanding of the overall image content. I
n this paper we propose a new pre-training method called OCR-Text Destylization
Modeling (ODM) that transfers diverse styles of text found in images to a unifor
m style based on the text prompt. With ODM we achieve better alignment between t
ext and OCR-Text and enable pre-trained models to adapt to the complex and diver
se styles of scene text detection and spotting tasks. Additionally we have desig
ned a new labeling generation method specifically for ODM and combined it with o
ur proposed Text-Controller module to address the challenge of annotation costs
in OCR tasks allowing a larger amount of unlabeled data to participate in pre-tr
aining. Extensive experiments on multiple public datasets demonstrate that our m
ethod significantly improves performance and outperforms current pre-training me
thods in scene text detection and spotting tasks. Code is available at https://g
ithub.com/PriNing/ODM.

TiNO-Edit: Timestep and Noise Optimization for Robust Diffusion-Based Image Edit
ing
Sherry X Chen, Yaron Vaxman, Elad Ben Baruch, David Asulin, Aviad Moreshet, Kuo-
Chin Lien, Misha Sra, Pradeep Sen; Proceedings of the IEEE/CVF Conference on Com
puter Vision and Pattern Recognition (CVPR), 2024, pp. 6337-6346
Despite many attempts to leverage pre-trained text-to-image models (T2I) like St
able Diffusion (SD) for controllable image editing producing good predictable re
sults remains a challenge. Previous approaches have focused on either fine-tunin
g pre-trained T2I models on specific datasets to generate certain kinds of image
s (e.g. with a specific object or person) or on optimizing the weights text prom
pts and/or learning features for each input image in an attempt to coax the imag
e generator to produce the desired result. However these approaches all have sho
rtcomings and fail to produce good results in a predictable and controllable man
ner. To address this problem we present TiNO-Edit an SD-based method that focuse
s on optimizing the noise patterns and diffusion timesteps during editing someth
ing previously unexplored in the literature. With this simple change we are able
 to generate results that both better align with the original images and reflect
 the desired result. Furthermore we propose a set of new loss functions that ope
rate in the latent domain of SD greatly speeding up the optimization when compar
ed to prior losses which operate in the pixel domain. Our method can be easily a
pplied to variations of SD including Textual Inversion and DreamBooth that encod
e new concepts and incorporate them into the edited results. We present a host o
f image-editing capabilities enabled by our approach. Our code is publicly avail
able at https://github.com/SherryXTChen/TiNO-Edit.
****

Epistemic Uncertainty Quantification For Pre-Trained Neural Networks
Hanjing Wang, Qiang Ji; Proceedings of the IEEE/CVF Conference on Computer Visio
n and Pattern Recognition (CVPR), 2024, pp. 11052-11061
Epistemic uncertainty quantification (UQ) identifies where models lack knowledge
. Traditional UQ methods often based on Bayesian neural networks are not suitabl
e for pre-trained non-Bayesian models. Our study addresses quantifying epistemic
 uncertainty for any pre-trained model which does not need the original training
 data or model modifications and can ensure broad applicability regardless of ne
twork architectures or training techniques. Specifically we propose a gradient-b
ased approach to assess epistemic uncertainty analyzing the gradients of outputs
 relative to model parameters and thereby indicating necessary model adjustments
 to accurately represent the inputs. We first explore theoretical guarantees of
gradient-based methods for epistemic UQ questioning the view that this uncertain
ty is only calculable through differences between multiple models. We further im
prove gradient-driven UQ by using class-specific weights for integrating gradien
ts and emphasizing distinct contributions from neural network layers. Additional
ly we enhance UQ accuracy by combining gradient and perturbation methods to refi
ne the gradients. We evaluate our approach on out-of-distribution detection unce
rtainty calibration and active learning demonstrating its superiority over curre
nt state-of-the-art UQ methods for pre-trained models.

Diffusion-ES: Gradient-free Planning with Diffusion for Autonomous and Instruction-guided Driving
Brian Yang, Huangyuan Su, Nikolaos Gkanatsios, Tsung-Wei Ke, Ayush Jain, Jeff Schneider, Katerina Fragkiadaki; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 15342-15353
Diffusion models excel at modeling complex and multimodal trajectory distributions for decision-making and control. Reward-gradient guided denoising has been recently proposed to generate trajectories that maximize both a differentiable reward function and the likelihood under the data distribution captured by a diffusion model. Reward-gradient guided denoising requires a differentiable reward function fitted to both clean and noised samples limiting its applicability as a general trajectory optimizer. In this paper we propose DiffusionES a method that combines gradient-free optimization with trajectory denoising to optimize black-box non-differentiable objectives while staying in the data manifold. Diffusion-ES samples trajectories during evolutionary search from a diffusion model and scores them using a black-box reward function. It mutates high-scoring trajectories using a truncated diffusion process that applies a small number of noising and denoising steps allowing for much more efficient exploration of the solution space. We show that DiffusionES achieves state-of-the-art performance on nuPlan an established closed-loop planning benchmark for autonomous driving. Diffusion-ES outperforms existing sampling-based planners reactive deterministic or diffusion-based policies and reward-gradient guidance. Additionally we show that unlike prior guidance methods our method can optimize non-differentiable language-shaped reward functions generated by few-shot LLM prompting. When guided by a human teacher that issues instructions to follow our method can generate novel highly complex behaviors such as aggressive lane weaving which are not present in the training data. This allows us to solve the hardest nuPlan scenarios which are beyond the capabilities of existing trajectory optimization methods and driving policies.
****
AdaShift: Learning Discriminative Self-Gated Neural Feature Activation With an Adaptive Shift Factor
Sudong Cai; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 5947-5956
Nonlinearities are decisive in neural representation learning. Traditional Activation (Act) functions impose fixed inductive biases on neural networks with oriented biological intuitions. Recent methods leverage self-gated curves to compensate for the rigid traditional Act paradigms in fitting flexibility. However substantial improvements are still impeded by the norm-induced mismatched feature re-calibrations (see Section 1) i.e. the actual importance of a feature can be inconsistent with its explicit intensity such that violates the basic intention of a direct self-gated feature re-weighting. To address this problem we propose to learn discriminative neural feature Act with a novel prototype namely AdaShift which enhances typical self-gated Act by incorporating an adaptive shift factor into the re-weighting function of Act. AdaShift casts dynamic translations on the inputs of a re-weighting function by exploiting comprehensive feature-filter context cues of different ranges in a simple yet effective manner. We obtain the new intuitions of AdaShift by rethinking the feature-filter relationships from a common Softmax-based classification and by generalizing the new observations to a common learning layer that encodes features with updatable filters. Our practical AdaShifts built upon the new Act prototype demonstrate significant improvements to the popular/SOTA Act functions on different vision benchmarks. By simply replacing ReLU with AdaShifts ResNets can match advanced Transformer counterparts (e.g. ResNet-50 vs. Swin-T) with lower cost and fewer parameters.

SCEdit: Efficient and Controllable Image Diffusion Generation via Skip Connection Editing
Zeyinzi Jiang, Chaojie Mao, Yulin Pan, Zhen Han, Jingfeng Zhang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 8995-9004

Image diffusion models have been utilized in various tasks such as text-to-image generation and controllable image synthesis. Recent research has introduced tuning methods that make subtle adjustments to the original models yielding promising results in specific adaptations of foundational generative diffusion models. Rather than modifying the main backbone of the diffusion model we delve into the role of skip connection in U-Net and reveal that hierarchical features aggregating long-distance information across encoder and decoder make a significant impact on the content and quality of image generation. Based on the observation we propose an efficient generative tuning framework dubbed SCEdit which integrates and edits Skip Connection using a lightweight tuning module named SC-Tuner. Furthermore the proposed framework allows for straightforward extension to controllable image synthesis by injecting different conditions with Controllable SC-Tuner simplifying and unifying the network design for multi-condition inputs. Our SCEdit substantially reduces training parameters memory usage and computational expense due to its lightweight tuners with backward propagation only passing to the decoder blocks. Extensive experiments conducted on text-to-image generation and controllable image synthesis tasks demonstrate the superiority of our method in terms of efficiency and performance. Project page: https://scedit.github.io/.

MRC-Net: 6-DoF Pose Estimation with MultiScale Residual Correlation
Yuelong Li, Yafei Mao, Raja Bala, Sunil Hadap; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 10476-10486
We propose a single-shot approach to determining 6-DoF pose of an object with available 3D computer-aided design (CAD) model from a single RGB image. Our method dubbed MRC-Net comprises two stages. The first performs pose classification and renders the 3D object in the classified pose. The second stage performs regression to predict fine-grained residual pose within class. Connecting the two stages is a novel multi-scale residual correlation (MRC) layer that captures high-and-low level correspondences between the input image and rendering from first stage. MRC-Net employs a Siamese network with shared weights between both stages to learn embeddings for input and rendered images. To mitigate ambiguity when predicting discrete pose class labels on symmetric objects we use soft probabilistic labels to define pose class in the first stage. We demonstrate state-of-the-art accuracy outperforming all competing RGB-based methods on four challenging BOP benchmark datasets: T-LESS LM-O YCB-V and ITODD. Our method is non-iterative and requires no complex post-processing. Our code and pretrained models are available at https://github.com/amzn/mrc-net-6d-pose

MonoCD: Monocular 3D Object Detection with Complementary Depths
Longfei Yan, Pei Yan, Shengzhou Xiong, Xuanyu Xiang, Yihua Tan; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 10248-10257
Monocular 3D object detection has attracted widespread attention due to its potential to accurately obtain object 3D localization from a single image at a low cost. Depth estimation is an essential but challenging subtask of monocular 3D object detection due to the ill-posedness of 2D to 3D mapping. Many methods explore multiple local depth clues such as object heights and keypoints and then formulate the object depth estimation as an ensemble of multiple depth predictions to mitigate the insufficiency of single-depth information. However the errors of existing multiple depths tend to have the same sign which hinders them from neutralizing each other and limits the overall accuracy of combined depth. To alleviate this problem we propose to increase the complementarity of depths with two novel designs. First we add a new depth prediction branch named complementary depth that utilizes global and efficient depth clues from the entire image rather than the local clues to reduce the correlation of depth predictions. Second we propose to fully exploit the geometric relations between multiple depth clues to achieve complementarity in form. Benefiting from these designs our method achieves higher complementarity. Experiments on the KITTI benchmark demonstrate that our method achieves state-of-the-art performance without introducing extra data. In addition complementary depth can also be a lightweight and plug-and-play module

to boost multiple existing monocular 3d object detectors. Code is available at https://github.com/elvintanhust/MonoCD.

ImageNet-D: Benchmarking Neural Network Robustness on Diffusion Synthetic Object
Chenshuang Zhang, Fei Pan, Junmo Kim, In So Kweon, Chengzhi Mao; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 21752-21762
We establish rigorous benchmarks for visual perception robustness. Synthetic images such as ImageNet-C ImageNet-9 and Stylized ImageNet provide specific type of evaluation over synthetic corruptions backgrounds and textures yet those robustness benchmarks are restricted in specified variations and have low synthetic quality. In this work we introduce generative model as a data source for synthesizing hard images that benchmark deep models' robustness. Leveraging diffusion models we are able to generate images with more diversified backgrounds textures and materials than any prior work where we term this benchmark as ImageNet-D. Experimental results show that ImageNet-D results in a significant accuracy drop to a range of vision models from the standard ResNet visual classifier to the latest foundation models like CLIP and MiniGPT-4 significantly reducing their accuracy by up to 60%. Our work suggests that diffusion models can be an effective source to test vision models. The code and dataset are available at https://github.com/chenshuang-zhang/imagenet_d.

Consistent3D: Towards Consistent High-Fidelity Text-to-3D Generation with Deterministic Sampling Prior
Zike Wu, Pan Zhou, Xuanyu Yi, Xiaoding Yuan, Hanwang Zhang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 9892-9902
Score distillation sampling (SDS) and its variants have greatly boosted the development of text-to-3D generation but are vulnerable to geometry collapse and poor textures yet. To solve this issue we first deeply analyze the SDS and find that its distillation sampling process indeed corresponds to the trajectory sampling of a stochastic differential equation (SDE): SDS samples along an SDE trajectory to yield a less noisy sample which then serves as a guidance to optimize a 3D model. However the randomness in SDE sampling often leads to a diverse and unpredictable sample which is not always less noisy and thus is not a consistently correct guidance explaining the vulnerability of SDS. Since for any SDE there always exists an ordinary differential equation (ODE) whose trajectory sampling can deterministically and consistently converge to the desired target point as the SDE we propose a novel and effective "Consistent3D" method that explores the ODE deterministic sampling prior for text-to-3D generation. Specifically at each training iteration given a rendered image by a 3D model we first estimate its desired 3D score function by a pre-trained 2D diffusion model and build an ODE for trajectory sampling. Next we design a consistency distillation sampling loss which samples along the ODE trajectory to generate two adjacent samples and uses the less noisy sample to guide another more noisy one for distilling the deterministic prior into the 3D model. Experimental results show the efficacy of our Consistent3D in generating high-fidelity and diverse 3D objects and large-scale scenes as shown in Fig. 1. The codes are available at https://github.com/sail-sg/Consistent3D.

ManipLLM: Embodied Multimodal Large Language Model for Object-Centric Robotic Manipulation
Xiaoqi Li, Mingxu Zhang, Yiran Geng, Haoran Geng, Yuxing Long, Yan Shen, Renrui Zhang, Jiaming Liu, Hao Dong; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 18061-18070
Robot manipulation relies on accurately predicting contact points and end-effector directions to ensure successful operation. However learning-based robot manipulation trained on a limited category within a simulator often struggles to achieve generalizability especially when confronted with extensive categories. Therefore we introduce an innovative approach for robot manipulation that leverages t

he robust reasoning capabilities of Multimodal Large Language Models (MLLMs) to enhance the stability and generalization of manipulation. By fine-tuning the injected adapters we preserve the inherent common sense and reasoning ability of the MLLMs while equipping them with the ability for manipulation. The fundamental insight lies in the introduced fine-tuning paradigm encompassing object category understanding affordance prior reasoning and object-centric pose prediction to stimulate the reasoning ability of MLLM in manipulation. During inference our approach utilizes an RGB image and text prompt to predict the end effector's pose in chain of thoughts. After the initial contact is established an active impedance adaptation policy is introduced to plan the upcoming waypoints in a closed-loop manner. Moreover in real world we design a test-time adaptation (TTA) strategy for manipulation to enable the model better adapt to the current real-world scene configuration. Experiments in simulator and real-world show the promising performance of ManipLLM. More details and demonstrations can be found at https://sites.google.com/view/manipllm.

BA-SAM: Scalable Bias-Mode Attention Mask for Segment Anything Model
Yiran Song, Qianyu Zhou, Xiangtai Li, Deng-Ping Fan, Xuequan Lu, Lizhuang Ma; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 3162-3173
In this paper we address the challenge of image resolution variation for the Segment Anything Model (SAM). SAM known for its zero-shot generalizability exhibits a performance degradation when faced with datasets with varying image sizes. Previous approaches tend to resize the image to a fixed size or adopt structure modifications hindering the preservation of SAM's rich prior knowledge. Besides such task-specific tuning necessitates a complete retraining of the model which is cost-expensive and unacceptable for deployment in the downstream tasks. In this paper we reformulate this challenge as a length extrapolation problem where token sequence length varies while maintaining a consistent patch size for images with different sizes. To this end we propose a Scalable Bias-Mode Attention Mask (BA-SAM) to enhance SAM's adaptability to varying image resolutions while eliminating the need for structure modifications. Firstly we introduce a new scaling factor to ensure consistent magnitude in the attention layer's dot product values when the token sequence length changes. Secondly we present a bias-mode attention mask that allows each token to prioritize neighboring information mitigating the impact of untrained distant information. Our BA-SAM demonstrates efficacy in two scenarios: zero-shot and fine-tuning. Extensive evaluation of diverse datasets including DIS5K DUTS ISIC COD10K and COCO reveals its ability to significantly mitigate performance degradation in the zero-shot setting and achieve state-of-the-art performance with minimal fine-tuning. Furthermore we propose a generalized model and benchmark showcasing BA-SAM's generalizability across all four datasets simultaneously.

Text-Enhanced Data-free Approach for Federated Class-Incremental Learning
Minh-Tuan Tran, Trung Le, Xuan-May Le, Mehrtash Harandi, Dinh Phung; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 23870-23880
Federated Class-Incremental Learning (FCIL) is an underexplored yet pivotal issue involving the dynamic addition of new classes in the context of federated learning. In this field Data-Free Knowledge Transfer (DFKT) plays a crucial role in addressing catastrophic forgetting and data privacy problems. However prior approaches lack the crucial synergy between DFKT and the model training phases causing DFKT to encounter difficulties in generating high-quality data from a non-anchored latent space of the old task model. In this paper we introduce LANDER (Label Text Centered Data-Free Knowledge Transfer) to address this issue by utilizing label text embeddings (LTE) produced by pretrained language models. Specifically during the model training phase our approach treats LTE as anchor points and constrains the feature embeddings of corresponding training samples around them enriching the surrounding area with more meaningful information. In the DFKT phase by using these LTE anchors LANDER can synthesize more meaningful samples ther

eby effectively addressing the forgetting problem. Additionally instead of tight ly constraining embeddings toward the anchor the Bounding Loss is introduced to encourage sample embeddings to remain flexible within a defined radius. This app roach preserves the natural differences in sample embeddings and mitigates the e mbedding overlap caused by heterogeneous federated settings. Extensive experimen ts conducted on CIFAR100 Tiny-ImageNet and ImageNet demonstrate that LANDER sign ificantly outperforms previous methods and achieves state-of-the-art performance in FCIL. The code is available at https://github.com/tmtuan1307/lander.

Deciphering 'What' and 'Where' Visual Pathways from Spectral Clustering of Layer -Distributed Neural Representations
Xiao Zhang, David Yunis, Michael Maire; Proceedings of the IEEE/CVF Conference o n Computer Vision and Pattern Recognition (CVPR), 2024, pp. 4165-4175
We present an approach for analyzing grouping information contained within a neu ral network's activations permitting extraction of spatial layout and semantic s egmentation from the behavior of large pre-trained vision models. Unlike prior w ork our method conducts a wholistic analysis of a network's activation state lev eraging features from all layers and obviating the need to guess which part of t he model contains relevant information. Motivated by classic spectral clustering we formulate this analysis in terms of an optimization objective involving a se t of affinity matrices each formed by comparing features within a different laye r. Solving this optimization problem using gradient descent allows our technique to scale from single images to dataset-level analysis including in the latter b oth intra- and inter-image relationships. Analyzing a pre-trained generative tra nsformer provides insight into the computational strategy learned by such models . Equating affinity with key-query similarity across attention layers yields eig envectors encoding scene spatial layout whereas defining affinity by value vecto r similarity yields eigenvectors encoding object identity. This result suggests that key and query vectors coordinate attentional information flow according to spatial proximity (a `where' pathway) while value vectors refine a semantic cate gory representation (a `what' pathway).

GLaMM: Pixel Grounding Large Multimodal Model
Hanoona Rasheed, Muhammad Maaz, Sahal Shaji, Abdelrahman Shaker, Salman Khan, Hi sham Cholakkal, Rao M. Anwer, Eric Xing, Ming-Hsuan Yang, Fahad S. Khan; Proceed ings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 13009-13018
Large Multimodal Models (LMMs) extend Large Language Models to the vision domain . Initial LMMs used holistic images and text prompts to generate ungrounded text ual responses. Recently region-level LMMs have been used to generate visually gr ounded responses. However they are limited to only referring to a single object category at a time require users to specify the regions or cannot offer dense pi xel-wise object grounding. In this work we present Grounding LMM (GLaMM) the fir st model that can generate natural language responses seamlessly intertwined wit h corresponding object segmentation masks. GLaMM not only grounds objects appear ing in the conversations but is flexible enough to accept both textual and optio nal visual prompts (region of interest) as input. This empowers users to interac t with the model at various levels of granularity both in textual and visual dom ains. Due to the lack of standard benchmarks for the novel setting of visually G rounded Conversation Generation (GCG) we introduce a comprehensive evaluation pr otocol with our curated grounded conversations. Our proposed GCG task requires d ensely grounded concepts in natural scenes at a large-scale. To this end we prop ose a densely annotated Grounding-anything Dataset (GranD) using our proposed au tomated annotation pipeline that encompasses 7.5M unique concepts grounded in a total of 810M regions available with segmentation masks. Besides GCG GLaMM also performs effectively on several downstream tasks e.g. referring expression segme ntation image and region-level captioning and vision-language conversations.

Incremental Residual Concept Bottleneck Models
Chenming Shang, Shiji Zhou, Hengyuan Zhang, Xinzhe Ni, Yujiu Yang, Yuwang Wang;

Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 11030-11040
Concept Bottleneck Models (CBMs) map the black-box visual representations extracted by deep neural networks onto a set of interpretable concepts and use the concepts to make predictions enhancing the transparency of the decision-making process. Multimodal pre-trained models can match visual representations with textual concept embeddings allowing for obtaining the interpretable concept bottleneck without the expertise concept annotations. Recent research has focused on the concept bank establishment and the high-quality concept selection. However it is challenging to construct a comprehensive concept bank through humans or large language models which severely limits the performance of CBMs. In this work we propose the Incremental Residual Concept Bottleneck Model (Res-CBM) to address the challenge of concept completeness. Specifically the residual concept bottleneck model employs a set of optimizable vectors to complete missing concepts then the incremental concept discovery module converts the complemented vectors with unclear meanings into potential concepts in the candidate concept bank. Our approach can be applied to any user-defined concept bank as a post-hoc processing method to enhance the performance of any CBMs. Furthermore to measure the descriptive efficiency of CBMs the Concept Utilization Efficiency (CUE) metric is proposed. Experiments show that the Res-CBM outperforms the current state-of-the-art methods in terms of both accuracy and efficiency and achieves comparable performance to black-box models across multiple datasets.

SPOC: Imitating Shortest Paths in Simulation Enables Effective Navigation and Manipulation in the Real World
Kiana Ehsani, Tanmay Gupta, Rose Hendrix, Jordi Salvador, Luca Weihs, Kuo-Hao Zeng, Kunal Pratap Singh, Yejin Kim, Winson Han, Alvaro Herrasti, Ranjay Krishna, Dustin Schwenk, Eli VanderBilt, Aniruddha Kembhavi; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 16238-16250
Reinforcement learning (RL) with dense rewards and imitation learning (IL) with human-generated trajectories are the most widely used approaches for training modern embodied agents. RL requires extensive reward shaping and auxiliary losses and is often too slow and ineffective for long-horizon tasks. While IL with human supervision is effective collecting human trajectories at scale is extremely expensive. In this work we show that imitating shortest-path planners in simulation produces agents that given a language instruction can proficiently navigate explore and manipulate objects in both simulation and in the real world using only RGB sensors (no depth map or GPS coordinates). This surprising result is enabled by our end-to-end transformer-based SPOC architecture powerful visual encoders paired with extensive image augmentation and the dramatic scale and diversity of our training data: millions of frames of shortest-path-expert trajectories collected inside approximately 200000 procedurally generated houses containing 40000 unique 3D assets. Our models data training code and newly proposed 10-task benchmarking suite CHORES are available at https://spoc-robot.github.io/.

Real-Time Exposure Correction via Collaborative Transformations and Adaptive Sampling
Ziwen Li, Feng Zhang, Meng Cao, Jinpu Zhang, Yuanjie Shao, Yuehuan Wang, Nong Sang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 2984-2994
Most of the previous exposure correction methods learn dense pixel-wise transformations to achieve promising results but consume huge computational resources. Recently Learnable 3D lookup tables (3D LUTs) have demonstrated impressive performance and efficiency for image enhancement. However these methods can only perform global transformations and fail to finely manipulate local regions. Moreover they uniformly downsample the input image which loses the rich color information and limits the learning of color transformation capabilities. In this paper we present a collaborative transformation framework (CoTF) for real-time exposure correction which integrates global transformation with pixel-wise transformations

in an efficient manner. Specifically the global transformation adjusts the overall appearance using image-adaptive 3D LUTs to provide decent global contrast and sharp details while the pixel transformation compensates for local context. Then a relation-aware modulation module is designed to combine these two components effectively. In addition we propose an adaptive sampling strategy to preserve more color information by predicting the sampling intervals thus providing higher quality input data for the learning of 3D LUTs. Extensive experiments demonstrate that our method can process high-resolution images in real-time on GPUs while achieving comparable performance against current state-of-the-art methods. The code is available at https://github.com/HUST-IAL/CoTF.
****
Lodge: A Coarse to Fine Diffusion Network for Long Dance Generation Guided by the Characteristic Dance Primitives
Ronghui Li, YuXiang Zhang, Yachao Zhang, Hongwen Zhang, Jie Guo, Yan Zhang, Yebin Liu, Xiu Li; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 1524-1534
We propose Lodge a network capable of generating extremely long dance sequences conditioned on given music. We design Lodge as a two-stage coarse to fine diffusion architecture and propose the characteristic dance primitives that possess significant expressiveness as intermediate representations between two diffusion models. The first stage is global diffusion which focuses on comprehending the coarse-level music-dance correlation and production characteristic dance primitives. In contrast the second-stage is the local diffusion which parallelly generates detailed motion sequences under the guidance of the dance primitives and choreographic rules. In addition we propose a Foot Refine Block to optimize the contact between the feet and the ground enhancing the physical realism of the motion. Code available at https://li-ronghui.github.io/lodge
****
UDiFF: Generating Conditional Unsigned Distance Fields with Optimal Wavelet Diffusion
Junsheng Zhou, Weiqi Zhang, Baorui Ma, Kanle Shi, Yu-Shen Liu, Zhizhong Han; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 21496-21506
Diffusion models have shown remarkable results for image generation editing and inpainting. Recent works explore diffusion models for 3D shape generation with neural implicit functions i.e. signed distance function and occupancy function. However they are limited to shapes with closed surfaces which prevents them from generating diverse 3D real-world contents containing open surfaces. In this work we present UDiFF a 3D diffusion model for unsigned distance fields (UDFs) which is capable to generate textured 3D shapes with open surfaces from text conditions or unconditionally. Our key idea is to generate UDFs in spatial-frequency domain with an optimal wavelet transformation which produces a compact representation space for UDF generation. Specifically instead of selecting an appropriate wavelet transformation which requires expensive manual efforts and still leads to large information loss we propose a data-driven approach to learn the optimal wavelet transformation for UDFs. We evaluate UDiFF to show our advantages by numerical and visual comparisons with the latest methods on widely used benchmarks. Page: https://weiqi-zhang.github.io/UDiFF.

LoCoNet: Long-Short Context Network for Active Speaker Detection
Xizi Wang, Feng Cheng, Gedas Bertasius; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 18462-18472
Active Speaker Detection (ASD) aims to identify who is speaking in each frame of a video. Solving ASD involves using audio and visual information in two complementary contexts: long-term intra-speaker context models the temporal dependencies of the same speaker while short-term inter-speaker context models the interactions of speakers in the same scene. Motivated by these observations we propose LoCoNet a simple but effective Long-Short Context Network that leverages Long-term Intra-speaker Modeling (LIM) and Short-term Inter-speaker Modeling (SIM) in an interleaved manner. LIM employs self-attention for long-range temporal dependen

cies modeling and cross-attention for audio-visual interactions modeling. SIM in corporates convolutional blocks that capture local patterns for short-term inter -speaker context. Experiments show that LoCoNet achieves state-of-the-art perfor mance on multiple datasets with 95.2% (+0.3%) mAP on AVA-ActiveSpeaker 97.2% (+2 .7%) mAP on Talkies and 68.4% (+7.7%) mAP on Ego4D. Moreover in challenging case s where multiple speakers are present LoCoNet outperforms previous state-of-the- art methods by 3.0% mAP on AVA-ActiveSpeaker. The code is available at https://g ithub.com/SJTUwxz/LoCoNet_ASD.

D3still: Decoupled Differential Distillation for Asymmetric Image Retrieval
Yi Xie, Yihong Lin, Wenjie Cai, Xuemiao Xu, Huaidong Zhang, Yong Du, Shengfeng H e; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recogni tion (CVPR), 2024, pp. 17181-17190
Existing methods for asymmetric image retrieval employ a rigid pairwise similari ty constraint between the query network and the larger gallery network. However these one-to-one constraint approaches often fail to maintain retrieval order co nsistency especially when the query network has limited representational capacit y. To overcome this problem we introduce the Decoupled Differential Distillation (D3still) framework. This framework shifts from absolute one-to-one supervision to optimizing the relational differences in pairwise similarities produced by t he query and gallery networks thereby preserving a consistent retrieval order ac ross both networks. Our method involves computing a pairwise similarity differen tial matrix within the gallery domain which is then decomposed into three compon ents: feature representation knowledge inconsistent pairwise similarity differen tial knowledge and consistent pairwise similarity differential knowledge. This s trategic decomposition aligns the retrieval ranking of the query network with th e gallery network effectively. Extensive experiments on various benchmark datase ts reveal that D3still surpasses state-of-the-art methods in asymmetric image re trieval. Code is available at https://github.com/SCY-X/D3still.

Transcending Forgery Specificity with Latent Space Augmentation for Generalizabl e Deepfake Detection
Zhiyuan Yan, Yuhao Luo, Siwei Lyu, Qingshan Liu, Baoyuan Wu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 8984-8994
Deepfake detection faces a critical generalization hurdle with performance deter iorating when there is a mismatch between the distributions of training and test ing data. A broadly received explanation is the tendency of these detectors to b e overfitted to forgery-specific artifacts rather than learning features that ar e widely applicable across various forgeries. To address this issue we propose a simple yet effective detector called LSDA (\underline L atent \underline S pace \underline D ata \underline A ugmentation) which is based on a heuristic idea: representations with a wider variety of forgeries should be able to learn a more generalizable decision boundary thereby mitigating the overfitting of method-sp ecific features (see Fig. 1). Following this idea we propose to enlarge the forg ery space by constructing and simulating variations within and across forgery fe atures in the latent space. This approach encompasses the acquisition of enriche d domain-specific features and the facilitation of smoother transitions between different forgery types effectively bridging domain gaps. Our approach culminate s in refining a binary classifier that leverages the distilled knowledge from th e enhanced features striving for a generalizable deepfake detector. Comprehensiv e experiments show that our proposed method is surprisingly effective and transc ends state-of-the-art detectors across several widely used benchmarks.

Scaling Laws of Synthetic Images for Model Training ... for Now
Lijie Fan, Kaifeng Chen, Dilip Krishnan, Dina Katabi, Phillip Isola, Yonglong Ti an; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recogn ition (CVPR), 2024, pp. 7382-7392
Recent significant advances in text-to-image models unlock the possibility of tr aining vision systems using synthetic images potentially overcoming the difficul

ty of collecting curated data at scale. It is unclear however how these models behave at scale as more synthetic data is added to the training set. In this paper we study the scaling laws of synthetic images generated by state of the art text-to-image models for the training of supervised models: image classifiers with label supervision and CLIP with language supervision. We identify several factors including text prompts classifier-free guidance scale and types of text-to-image models that significantly affect scaling behavior. After tuning these factors we observe that synthetic images demonstrate a scaling trend similar to but slightly less effective than real images in CLIP training while they significantly underperform in scaling when training supervised image classifiers. Our analysis indicates that the main reason for this underperformance is the inability of off-the-shelf text-to-image models to generate certain concepts a limitation that significantly impairs the training of image classifiers. Our findings also suggest that scaling synthetic data can be particularly effective in scenarios such as: (1) when there is a limited supply of real images for a supervised problem (e.g. fewer than 0.5 million images in ImageNet) (2) when the evaluation dataset diverges significantly from the training data indicating the out-of-distribution scenario or (3) when synthetic data is used in conjunction with real images as demonstrated in the training of CLIP models.

Towards Large-scale 3D Representation Learning with Multi-dataset Point Prompt Training

Xiaoyang Wu, Zhuotao Tian, Xin Wen, Bohao Peng, Xihui Liu, Kaicheng Yu, Hengshuang Zhao; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 19551-19562

The rapid advancement of deep learning models is often attributed to their ability to leverage massive training data. In contrast such privilege has not yet fully benefited 3D deep learning mainly due to the limited availability of large-scale 3D datasets. Merging multiple available data sources and letting them collaboratively train a single model is a potential solution. However due to the large domain gap between 3D point cloud datasets such mixed supervision could adversely affect the model's performance and lead to degenerated performance (i.e. negative transfer) compared to single-dataset training. In view of this challenge we introduce Point Prompt Training (PPT) a novel framework for multi-dataset synergistic learning in the context of 3D representation learning that supports multiple pre-training paradigms. Based on this framework we propose Prompt-driven Normalization which adapts the model to different datasets with domain-specific prompts and Language-guided Categorical Alignment that decently unifies the multiple-dataset label spaces by leveraging the relationship between label text. Extensive experiments verify that PPT can overcome the negative transfer associated with synergistic learning and produce generalizable representations. Notably it achieves state-of-the-art performance on each dataset using a single weight-shared model with supervised multi-dataset training. Moreover when served as a pre-training framework it outperforms other pre-training approaches regarding representation quality and attains remarkable state-of-the-art performance across over ten diverse downstream tasks spanning both indoor and outdoor 3D scenarios.

Learning Triangular Distribution in Visual World

Ping Chen, Xingpeng Zhang, Chengtao Zhou, Dichao Fan, Peng Tu, Le Zhang, Yanlin Qian; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 11019-11029

Convolution neural network is successful in pervasive vision tasks including label distribution learning which usually takes the form of learning an injection from the non-linear visual features to the well-defined labels. However how the discrepancy between features is mapped to the label discrepancy is ambient and its correctness is not guaranteed.To address these problems we study the mathematical connection between feature and its label presenting a general and simple framework for label distribution learning. We propose a so-called Triangular Distribution Transform (TDT) to build an injective function between feature and label guaranteeing that any symmetric feature discrepancy linearly reflects the differ

ence between labels. The proposed TDT can be used as a plug-in in mainstream backbone networks to address different label distribution learning tasks. Experiments on Facial Age Recognition Illumination Chromaticity Estimation and Aesthetics assessment show that TDT achieves on-par or better results than the prior arts.

State Space Models for Event Cameras
Nikola Zubic, Mathias Gehrig, Davide Scaramuzza; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 5819-5828
Today state-of-the-art deep neural networks that process event-camera data first convert a temporal window of events into dense grid-like input representations. As such they exhibit poor generalizability when deployed at higher inference frequencies (i.e. smaller temporal windows) than the ones they were trained on. We address this challenge by introducing state-space models (SSMs) with learnable timescale parameters to event-based vision. This design adapts to varying frequencies without the need to retrain the network at different frequencies. Additionally we investigate two strategies to counteract aliasing effects when deploying the model at higher frequencies. We comprehensively evaluate our approach against existing methods based on RNN and Transformer architectures across various benchmarks including Gen1 and 1 Mpx event camera datasets. Our results demonstrate that SSM-based models train 33% faster and also exhibit minimal performance degradation when tested at higher frequencies than the training input. Traditional RNN and Transformer models exhibit performance drops of more than 20 mAP with SSMs having a drop of 3.31 mAP highlighting the effectiveness of SSMs in event-based vision tasks.

SHINOBI: Shape and Illumination using Neural Object Decomposition via BRDF Optimization In-the-wild
Andreas Engelhardt, Amit Raj, Mark Boss, Yunzhi Zhang, Abhishek Kar, Yuanzhen Li, Deqing Sun, Ricardo Martin Brualla, Jonathan T. Barron, Hendrik P. A. Lensch, Varun Jampani; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 19636-19646
We present SHINOBI an end-to-end framework for the reconstruction of shape material and illumination from object images captured with varying lighting pose and background. Inverse rendering of an object based on unconstrained image collections is a long-standing challenge in computer vision and graphics and requires a joint optimization over shape radiance and pose. We show that an implicit shape representation based on a multi-resolution hash encoding enables faster and robust shape reconstruction with joint camera alignment optimization that outperforms prior work. Further to enable the editing of illumination and object reflectance (i.e. material) we jointly optimize BRDF and illumination together with the o

bject's shape. Our method is class-agnostic and works on in-the-wild image colle ctions of objects to produce relightable 3D assets for several use cases such as AR/VR movies games etc.
****
ES3: Evolving Self-Supervised Learning of Robust Audio-Visual Speech Representat ions
Yuanhang Zhang, Shuang Yang, Shiguang Shan, Xilin Chen; Proceedings of the IEEE/ CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 2706 9-27079
We propose a novel strategy ES3 for self-supervised learning of robust audio-vis ual speech representations from unlabeled talking face videos. While many recent approaches for this task primarily rely on guiding the learning process using t he audio modality alone to capture information shared between audio and video we reframe the problem as the acquisition of shared unique (modality-specific) and synergistic speech information to address the inherent asymmetry between the mo dalities. Based on this formulation we propose a novel "evolving" strategy that progressively builds joint audio-visual speech representations that are strong f or both uni-modal (audio & visual) and bi-modal (audio-visual) speech. First we leverage the more easily learnable audio modality to initialize audio and visual representations by capturing audio-unique and shared speech information. Next w e incorporate video-unique speech information and bootstrap the audio-visual rep resentations on top of the previously acquired shared knowledge. Finally we maxi mize the total audio-visual speech information including synergistic information to obtain robust and comprehensive representations. We implement ES3 as a simpl e Siamese framework and experiments on both English benchmarks and a newly contr ibuted large-scale Mandarin dataset show its effectiveness. In particular on LRS 2-BBC our smallest model is on par with SoTA models with only 1/2 parameters and 1/8 unlabeled data (223h).

TeTriRF: Temporal Tri-Plane Radiance Fields for Efficient Free-Viewpoint Video
Minye Wu, Zehao Wang, Georgios Kouros, Tinne Tuytelaars; Proceedings of the IEEE /CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 648 7-6496
Neural Radiance Fields (NeRF) revolutionize the realm of visual media by providi ng photorealistic Free-Viewpoint Video (FVV) experiences offering viewers unpara lleled immersion and interactivity. However the technology's significant storage requirements and the computational complexity involved in generation and render ing currently limit its broader application. To close this gap this paper presen ts Temporal Tri-Plane Radiance Fields (TeTriRF) a novel technology that signific antly reduces the storage size for Free-Viewpoint Video (FVV) while maintaining low-cost generation and rendering. TeTriRF introduces a hybrid representation wi th tri-planes and voxel grids to support scaling up to long-duration sequences a nd scenes with complex motions or rapid changes. We propose a group training sch eme tailored to achieving high training efficiency and yielding temporally consi stent low-entropy scene representations on feature domain. Leveraging these prop erties of the representations we introduce a compression pipeline with off-the-s helf video codecs achieving an order of magnitude less storage size compared to the state-of-the-art. Our experiments demonstrate that TeTriRF can achieve compe titive quality with a higher compression rate.
****
Motion2VecSets: 4D Latent Vector Set Diffusion for Non-rigid Shape Reconstructio n and Tracking
Wei Cao, Chang Luo, Biao Zhang, Matthias Nießner, Jiapeng Tang; Proceedings of t he IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 20496-20506
We introduce Motion2VecSets a 4D diffusion model for dynamic surface reconstruct ion from point cloud sequences. While existing state-of-the-art methods have dem onstrated success in reconstructing non-rigid objects using neural field represe ntations conventional feed-forward networks encounter challenges with ambiguous observations from noisy partial or sparse point clouds. To address these challen

ges we introduce a diffusion model that explicitly learns the shape and motion distribution of non-rigid objects through an iterative denoising process of compressed latent representations. The diffusion-based priors enable more plausible and probabilistic reconstructions when handling ambiguous inputs. We parameterize 4D dynamics with latent sets instead of using global latent codes. This novel 4D representation allows us to learn local shape and deformation patterns leading to more accurate non-linear motion capture and significantly improving generalizability to unseen motions and identities. For more temporally-coherent object tracking we synchronously denoise deformation latent sets and exchange information across multiple frames. To avoid computational overhead we designed an interleaved space and time attention block to alternately aggregate deformation latents along spatial and temporal domains. Extensive comparisons against state-of-the-art methods demonstrate the superiority of our Motion2VecSets in 4D reconstruction from various imperfect observations.
****
DiaLoc: An Iterative Approach to Embodied Dialog Localization
Chao Zhang, Mohan Li, Ignas Budvytis, Stephan Liwicki; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 12585-12593
Multimodal learning has advanced the performance for many vision-language tasks. However most existing works in embodied dialog research focus on navigation and leave the localization task understudied. The few existing dialog-based localization approaches assume the availability of entire dialog prior to localizaiton which is impractical for deployed dialog-based localization. In this paper we propose DiaLoc a new dialog-based localization framework which aligns with a real human operator behavior. Specifically we produce an iterative refinement of location predictions which can visualize current pose believes after each dialog turn. DiaLoc effectively utilizes the multimodal data for multi-shot localization where a fusion encoder fuses vision and dialog information iteratively. We achieve state-of-the-art results on embodied dialog-based localization task in single-shot (+7.08% in Acc5@valUnseen) and multi-shot settings (+10.85% in Acc5@valUnseen). DiaLoc narrows the gap between simulation and real-world applications opening doors for future research on collaborative localization and navigation.
****
Self-Training Large Language Models for Improved Visual Program Synthesis With Visual Reinforcement
Zaid Khan, Vijay Kumar BG, Samuel Schulter, Yun Fu, Manmohan Chandraker; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 14344-14353
Visual program synthesis is a promising approach to exploit the reasoning abilities of large language models for compositional computer vision tasks. Previous work has used few-shot prompting with frozen LLMs to synthesize visual programs. Training an LLM to write better visual programs is an attractive prospect but it is unclear how to accomplish this. No dataset of visual programs for training exists and acquisition of a visual program dataset cannot be easily crowdsourced due to the need for expert annotators. To get around the lack of direct supervision we explore improving the program synthesis abilities of an LLM using feedback from interactive experience. We propose a method where we exploit existing annotations for a vision-language task to improvise a coarse reward signal for that task treat the LLM as a policy and apply reinforced self-training to improve the visual program synthesis ability of the LLM for that task. We describe a series of experiments on object detection compositional visual question answering and image-text retrieval and show that in each case the self-trained LLM outperforms or performs on par with few-shot frozen LLMs that are an order of magnitude larger. A2XP: Towards Private Domain Generalization
Geunhyeok Yu, Hyoseok Hwang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 23544-23553
Deep Neural Networks (DNNs) have become pivotal in various fields especially in

computer vision outperforming previous methodologies. A critical challenge in th
eir deployment is the bias inherent in data across different domains such as ima
ge style and environmental conditions leading to domain gaps. This necessitates
techniques for learning general representations from biased training data known
as domain generalization. This paper presents Attend to eXpert Prompts (A2XP) a
novel approach for domain generalization that preserves the privacy and integrit
y of the network architecture. A2XP consists of two phases: Expert Adaptation an
d Domain Generalization. In the first phase prompts for each source domain are o
ptimized to guide the model towards the optimal direction. In the second phase t
wo embedder networks are trained to effectively amalgamate these expert prompts
aiming for an optimal output. Our extensive experiments demonstrate that A2XP ac
hieves state-of-the-art results over existing non-private domain generalization
methods. The experimental results validate that the proposed approach not only t
ackles the domain generalization challenge in DNNs but also offers a privacy-pre
serving efficient solution to the broader field of computer vision.

Event-assisted Low-Light Video Object Segmentation
Hebei Li, Jin Wang, Jiahui Yuan, Yue Li, Wenming Weng, Yansong Peng, Yueyi Zhang
, Zhiwei Xiong, Xiaoyan Sun; Proceedings of the IEEE/CVF Conference on Computer
Vision and Pattern Recognition (CVPR), 2024, pp. 3250-3259
In the realm of video object segmentation (VOS) the challenge of operating under
 low-light conditions persists resulting in notably degraded image quality and c
ompromised accuracy when comparing query and memory frames for similarity comput
ation. Event cameras characterized by their high dynamic range and ability to ca
pture motion information of objects offer promise in enhancing object visibility
 and aiding VOS methods under such low-light conditions. This paper introduces a
 pioneering framework tailored for low-light VOS leveraging event camera data to
 elevate segmentation accuracy. Our approach hinges on two pivotal components: t
he Adaptive Cross-Modal Fusion (ACMF) module aimed at extracting pertinent featu
res while fusing image and event modalities to mitigate noise interference and t
he Event-Guided Memory Matching (EGMM) module designed to rectify the issue of i
naccurate matching prevalent in low-light settings. Additionally we present the
creation of a synthetic LLE-DAVIS dataset and the curation of a real-world LLE-V
OS dataset encompassing frames and events. Experimental evaluations corroborate
the efficacy of our method across both datasets affirming its effectiveness in l
ow-light scenarios. The datasets are available at https://github.com/HebeiFast/E
ventLowLightVOS.

Active Domain Adaptation with False Negative Prediction for Object Detection
Yuzuru Nakamura, Yasunori Ishii, Takayoshi Yamashita; Proceedings of the IEEE/CV
F Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 28782-
28792
Domain adaptation adapts models to various scenes with different appearances. In
 this field active domain adaptation is crucial in effectively sampling a limite
d number of data in the target domain. We propose an active domain adaptation me
thod for object detection focusing on quantifying the undetectability of objects
. Existing methods for active sampling encounter challenges in considering undet
ected objects while estimating the uncertainty of model predictions. Our propose
d active sampling strategy addresses this issue using an active learning approac
h that simultaneously accounts for uncertainty and undetectability. Our newly pr
oposed False Negative Prediction Module evaluates the undetectability of images
containing undetected objects enabling more informed active sampling. This appro
ach considers previously overlooked undetected objects thereby reducing false ne
gative errors. Moreover using unlabeled data our proposed method utilizes uncert
ainty-guided pseudo-labeling to enhance domain adaptation further. Extensive exp
eriments demonstrate that the performance of our proposed method closely rivals
that of fully supervised learning while requiring only a fraction of the labelin
g efforts needed for the latter.

MLIP: Enhancing Medical Visual Representation with Divergence Encoder and Knowle

dge-guided Contrastive Learning
Zhe Li, Laurence T. Yang, Bocheng Ren, Xin Nie, Zhangyang Gao, Cheng Tan, Stan Z. Li; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 11704-11714
The scarcity of annotated data has sparked significant interest in unsupervised pre-training methods that leverage medical reports as auxiliary signals for medical visual representation learning. However existing research overlooks the multi-granularity nature of medical visual representation and lacks suitable contrastive learning techniques to improve the models' generalizability across different granularities leading to the underutilization of image-text information. To address this we propose MLIP a novel framework leveraging domain-specific medical knowledge as guiding signals to integrate language information into the visual domain through image-text contrastive learning. Our model includes global contrastive learning with our designed divergence encoder local token-knowledge-patch alignment contrastive learning and knowledge-guided category-level contrastive learning with expert knowledge. Experimental evaluations reveal the efficacy of our model in enhancing transfer performance for tasks such as image classification object detection and semantic segmentation. Notably MLIP surpasses state-of-the-art methods even with limited annotated data highlighting the potential of multimodal pre-training in advancing medical representation learning.

Generative 3D Part Assembly via Part-Whole-Hierarchy Message Passing
Bi'an Du, Xiang Gao, Wei Hu, Renjie Liao; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 20850-20859
Generative 3D part assembly involves understanding part relationships and predicting their 6-DoF poses for assembling a realistic 3D shape. Prior work often focus on the geometry of individual parts neglecting part-whole hierarchies of objects. Leveraging two key observations: 1) super-part poses provide strong hints about part poses and 2) predicting super-part poses is easier due to fewer super-parts we propose a part-whole-hierarchy message passing network for efficient 3D part assembly. We first introduce super-parts by grouping geometrically similar parts without any semantic labels. Then we employ a part-whole hierarchical encoder wherein a super-part encoder predicts latent super-part poses based on input parts. Subsequently we transform the point cloud using the latent poses feeding it to the part encoder for aggregating super-part information and reasoning about part relationships to predict all part poses. In training only ground-truth part poses are required. During inference the predicted latent poses of super-parts enhance interpretability. Experimental results on the PartNet dataset that our method achieves state-of-the-art performance in part and connectivity accuracy and enables an interpretable hierarchical part assembly.

VidToMe: Video Token Merging for Zero-Shot Video Editing
Xirui Li, Chao Ma, Xiaokang Yang, Ming-Hsuan Yang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 7486-7495
Diffusion models have made significant advances in generating high-quality images but their application to video generation has remained challenging due to the complexity of temporal motion. Zero-shot video editing offers a solution by utilizing pre-trained image diffusion models to translate source videos into new ones. Nevertheless existing methods struggle to maintain strict temporal consistency and efficient memory consumption. In this work we propose a novel approach to enhance temporal consistency in generated videos by merging self-attention tokens across frames. By aligning and compressing temporally redundant tokens across frames our method improves temporal coherence and reduces memory consumption in self-attention computations. The merging strategy matches and aligns tokens according to the temporal correspondence between frames facilitating natural temporal consistency in generated video frames. To manage the complexity of video processing we divide videos into chunks and develop intra-chunk local token merging and inter-chunk global token merging ensuring both short-term video continuity and long-term content consistency. Our video editing approach seamlessly extends the advancements in image editing to video editing rendering favorable results in

temporal consistency over state-of-the-art methods.

FaceChain-SuDe: Building Derived Class to Inherit Category Attributes for One-shot Subject-Driven Generation
Pengchong Qiao, Lei Shang, Chang Liu, Baigui Sun, Xiangyang Ji, Jie Chen; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 7215-7224
Recently subject-driven generation has garnered significant interest due to its ability to personalize text-to-image generation. Typical works focus on learning the new subject's private attributes. However an important fact has not been taken seriously that a subject is not an isolated new concept but should be a specialization of a certain category in the pre-trained model. This results in the subject failing to comprehensively inherit the attributes in its category causing poor attribute-related generations. In this paper motivated by object-oriented programming we model the subject as a derived class whose base class is its semantic category. This modeling enables the subject to inherit public attributes from its category while learning its private attributes from the user-provided example. Specifically we propose a plug-and-play method Subject-Derived regularization (SuDe). It constructs the base-derived class modeling by constraining the subject-driven generated images to semantically belong to the subject's category. Extensive experiments under three baselines and two backbones on various subjects show that our SuDe enables imaginative attribute-related generations while maintaining subject fidelity. For the codes please refer to \href https://github.com/modelscope/facechain FaceChain .

Benchmarking Segmentation Models with Mask-Preserved Attribute Editing
Zijin Yin, Kongming Liang, Bing Li, Zhanyu Ma, Jun Guo; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 22509-22519
When deploying segmentation models in practice it is critical to evaluate their behaviors in varied and complex scenes. Different from the previous evaluation paradigms only in consideration of global attribute variations (e.g. adverse weather) we investigate both local and global attribute variations for robustness evaluation. To achieve this we construct a mask-preserved attribute editing pipeline to edit visual attributes of real images with precise control of structural information. Therefore the original segmentation labels can be reused for the edited images. Using our pipeline we construct a benchmark covering both object and image attributes (e.g. color material pattern style). We evaluate a broad variety of semantic segmentation models spanning from conventional close-set models to recent open-vocabulary large models on their robustness to different types of variations. We find that both local and global attribute variations affect segmentation performances and the sensitivity of models diverges across different variation types. We argue that local attributes have the same importance as global attributes and should be considered in the robustness evaluation of segmentation models. Code: https://github.com/PRIS-CV/Pascal-EA.

Analyzing and Improving the Training Dynamics of Diffusion Models
Tero Karras, Miika Aittala, Jaakko Lehtinen, Janne Hellsten, Timo Aila, Samuli Laine; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 24174-24184
Diffusion models currently dominate the field of data-driven image synthesis with their unparalleled scaling to large datasets. In this paper we identify and rectify several causes for uneven and ineffective training in the popular ADM diffusion model architecture without altering its high-level structure. Observing uncontrolled magnitude changes and imbalances in both the network activations and weights over the course of training we redesign the network layers to preserve activation weight and update magnitudes on expectation. We find that systematic application of this philosophy eliminates the observed drifts and imbalances resulting in considerably better networks at equal computational complexity. Our modifications improve the previous record FID of 2.41 in ImageNet-512 synthesis to

1.81 achieved using fast deterministic sampling. As an independent contribution we present a method for setting the exponential moving average (EMA) parameters post-hoc i.e. after completing the training run. This allows precise tuning of EMA length without the cost of performing several training runs and reveals its surprising interactions with network architecture training time and guidance.

Hierarchical Correlation Clustering and Tree Preserving Embedding
Morteza Haghir Chehreghani, Mostafa Haghir Chehreghani; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 23083-23093
We propose a hierarchical correlation clustering method that extends the well-known correlation clustering to produce hierarchical clusters applicable to both positive and negative pairwise dissimilarities. Then in the following we study unsupervised representation learning with such hierarchical correlation clustering. For this purpose we first investigate embedding the respective hierarchy to be used for tree preserving embedding and feature extraction. Thereafter we study the extension of minimax distance measures to correlation clustering as another representation learning paradigm. Finally we demonstrate the performance of our methods on several datasets.

StableVITON: Learning Semantic Correspondence with Latent Diffusion Model for Virtual Try-On
Jeongho Kim, Guojung Gu, Minho Park, Sunghyun Park, Jaegul Choo; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 8176-8185
Given a clothing image and a person image an image-based virtual try-on aims to generate a customized image that appears natural and accurately reflects the characteristics of the clothing image. In this work we aim to expand the applicability of the pre-trained diffusion model so that it can be utilized independently for the virtual try-on task. The main challenge is to preserve the clothing details while effectively utilizing the robust generative capability of the pre-trained model. In order to tackle these issues we propose StableVITON learning the semantic correspondence between the clothing and the human body within the latent space of the pre-trained diffusion model in an end-to-end manner. Our proposed zero cross-attention blocks not only preserve the clothing details by learning the semantic correspondence but also generate high-fidelity images by utilizing the inherent knowledge of the pre-trained model in the warping process. Through our proposed novel attention total variation loss and applying augmentation we achieve the sharp attention map resulting in a more precise representation of clothing details. StableVITON outperforms the baselines in qualitative and quantitative evaluation showing promising quality in arbitrary person images. Our code is available at https://github.com/rlawjdghek/StableVITON.

Can Protective Perturbation Safeguard Personal Data from Being Exploited by Stable Diffusion?
Zhengyue Zhao, Jinhao Duan, Kaidi Xu, Chenan Wang, Rui Zhang, Zidong Du, Qi Guo, Xing Hu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 24398-24407
Stable Diffusion has established itself as a foundation model in generative AI artistic applications receiving widespread research and application. Some recent fine-tuning methods have made it feasible for individuals to implant personalized concepts onto the basic Stable Diffusion model with minimal computational costs on small datasets. However these innovations have also given rise to issues like facial privacy forgery and artistic copyright infringement. In recent studies researchers have explored the addition of imperceptible adversarial perturbations to images to prevent potential unauthorized exploitation and infringements when personal data is used for fine-tuning Stable Diffusion. Although these studies have demonstrated the ability to protect images it is essential to consider that these methods may not be entirely applicable in real-world scenarios. In this paper we systematically evaluate the use of perturbations to protect images wit

hin a practical threat model. The results suggest that these approaches may not be sufficient to safeguard image privacy and copyright effectively. Furthermore we introduce a purification method capable of removing protected perturbations while preserving the original image structure to the greatest extent possible. Experiments reveal that Stable Diffusion can effectively learn from purified images over all protective methods.

Make-Your-Anchor: A Diffusion-based 2D Avatar Generation Framework
Ziyao Huang, Fan Tang, Yong Zhang, Xiaodong Cun, Juan Cao, Jintao Li, Tong-Yee Lee; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 6997-7006
Despite the remarkable process of talking-head-based avatar-creating solutions directly generating anchor-style videos with full-body motions remains challenging. In this study we propose Make-Your-Anchor a novel system necessitating only a one-minute video clip of an individual for training subsequently enabling the automatic generation of anchor-style videos with precise torso and hand movements. Specifically we finetune a proposed structure-guided diffusion model on input video to render 3D mesh conditions into human appearances. We adopt a two-stage training strategy for the diffusion model effectively binding movements with specific appearances. To produce arbitrary long temporal video we extend the 2D U-Net in the frame-wise diffusion model to a 3D style without additional training cost and a simple yet effective batch-overlapped temporal denoising module is proposed to bypass the constraints on video length during inference. Finally a novel identity-specific face enhancement module is introduced to improve the visual quality of facial regions in the output videos. Comparative experiments demonstrate the effectiveness and superiority of the system in terms of visual quality temporal coherence and identity preservation outperforming SOTA diffusion/non-diffusion methods. Project page: https://github.com/ICTMCG/Make-Your-Anchor.

MultiPLY: A Multisensory Object-Centric Embodied Large Language Model in 3D World
Yining Hong, Zishuo Zheng, Peihao Chen, Yian Wang, Junyan Li, Chuang Gan; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 26406-26416
Human beings possess the capability to multiply a melange of multisensory cues while actively exploring and interacting with the 3D world. Current multi-modal large language models however passively absorb sensory data as inputs lacking the capacity to actively interact with the objects in the 3D environment and dynamically collect their multisensory information. To usher in the study of this area we propose MultiPLY a multisensory embodied large language model that could incorporate multisensory interactive data including visual audio tactile and thermal information into large language models thereby establishing the correlation among words actions and percepts. To this end we first collect Multisensory Universe a large-scale multisensory interaction dataset comprising 500k data by deploying an LLM-powered embodied agent to engage with the 3D environment. To perform instruction tuning with pre-trained LLM on such generated data we first encode the 3D scene as abstracted object-centric representations and then introduce action tokens denoting that the embodied agent takes certain actions within the environment as well as state tokens that represent the multisensory state observations of the agent at each time step. In the inference time MultiPLY could generate action tokens instructing the agent to take the action in the environment and obtain the next multisensory state observation. The observation is then appended back to the LLM via state tokens to generate subsequent text or action tokens. We demonstrate that MultiPLY outperforms baselines by a large margin through a diverse set of embodied tasks involving object retrieval tool use multisensory captioning and task decomposition.

Learning to Visually Localize Sound Sources from Mixtures without Prior Source Knowledge
Dongjin Kim, Sung Jin Um, Sangmin Lee, Jung Uk Kim; Proceedings of the IEEE/CVF

Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 26467-26476
The goal of the multi-sound source localization task is to localize sound sources from the mixture individually. While recent multi-sound source localization methods have shown improved performance they face challenges due to their reliance on prior information about the number of objects to be separated. In this paper to overcome this limitation we present a novel multi-sound source localization method that can perform localization without prior knowledge of the number of sound sources. To achieve this goal we propose an iterative object identification (IOI) module which can recognize sound-making objects in an iterative manner. After finding the regions of sound-making objects we devise object similarity-aware clustering (OSC) loss to guide the IOI module to effectively combine regions of the same object but also distinguish between different objects and backgrounds. It enables our method to perform accurate localization of sound-making objects without any prior knowledge. Extensive experimental results on the MUSIC and VGGSound benchmarks show the significant performance improvements of the proposed method over the existing methods for both single and multi-source. Our code is available at: https://github.com/VisualAIKHU/NoPrior_MultiSSL

Learning Dynamic Tetrahedra for High-Quality Talking Head Synthesis
Zicheng Zhang, Ruobing Zheng, Bonan Li, Congying Han, Tianqi Li, Meng Wang, Tiande Guo, Jingdong Chen, Ziwen Liu, Ming Yang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 5209-5219
Recent works in implicit representations such as Neural Radiance Fields (NeRF) have advanced the generation of realistic and animatable head avatars from video sequences. These implicit methods are still confronted by visual artifacts and jitters since the lack of explicit geometric constraints poses a fundamental challenge in accurately modeling complex facial deformations. In this paper we introduce Dynamic Tetrahedra (DynTet) a novel hybrid representation that encodes explicit dynamic meshes by neural networks to ensure geometric consistency across various motions and viewpoints. DynTet is parameterized by the coordinate-based networks which learn signed distance deformation and material texture anchoring the training data into a predefined tetrahedra grid. Leveraging Marching Tetrahedra DynTet efficiently decodes textured meshes with a consistent topology enabling fast rendering through a differentiable rasterizer and supervision via a pixel loss. To enhance training efficiency we incorporate classical 3D Morphable Models to facilitate geometry learning and define a canonical space for simplifying texture learning. These advantages are readily achievable owing to the effective geometric representation employed in DynTet. Compared with prior works DynTet demonstrates significant improvements in fidelity lip synchronization and real-time performance according to various metrics. Beyond producing stable and visually appealing synthesis videos our method also outputs the dynamic meshes which is promising to enable many emerging applications. Code is available at https://github.com/zhangzc21/DynTet.

Regressor-Segmenter Mutual Prompt Learning for Crowd Counting
Mingyue Guo, Li Yuan, Zhaoyi Yan, Binghui Chen, Yaowei Wang, Qixiang Ye; Proceed ings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 28380-28389
Crowd counting has achieved significant progress by training regressors to predi ct instance positions. In heavily crowded scenarios however regressors are chall enged by uncontrollable annotation variance which causes density map bias and co ntext information inaccuracy. In this study we propose mutual prompt learning (m Prompt) which leverages a regressor and a segmenter as guidance for each other s olving bias and inaccuracy caused by annotation variance while distinguishing fo reground from background. In specific mPrompt leverages point annotations to tun e the segmenter and predict pseudo head masks in a way of point prompt learning. It then uses the predicted segmentation masks which serve as spatial constraint to rectify biased point annotations as context prompt learning. mPrompt defines a way of mutual information maximization from prompt learning mitigating the im pact of annotation variance while improving model accuracy. Experiments show tha t mPrompt significantly reduces the Mean Average Error (MAE) demonstrating the p otential to be general framework for down-stream vision tasks. Code is available at https://github.com/csguomy/mPrompt.

Instantaneous Perception of Moving Objects in 3D
Di Liu, Bingbing Zhuang, Dimitris N. Metaxas, Manmohan Chandraker; Proceedings o f the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 202 4, pp. 19573-19583
The perception of 3D motion of surrounding traffic participants is crucial for d riving safety. While existing works primarily focus on general large motions we contend that the instantaneous detection and quantification of subtle motions is equally important as they indicate the nuances in driving behavior that may be safety critical such as behaviors near a stop sign of parking positions. We delv e into this under-explored task examining its unique challenges and developing o ur solution accompanied by a carefully designed benchmark. Specifically due to t he lack of correspondences between consecutive frames of sparse Lidar point clou ds static objects might appear to be moving - the so-called swimming effect. Thi s intertwines with the true object motion thereby posing ambiguity in accurate e stimation especially for subtle motion. To address this we propose to leverage l ocal occupancy completion of object point clouds to densify the shape cue and mi tigate the impact of swimming artifacts. The occupancy completion is learned in an end-to-end fashion together with the detection of moving objects and the esti mation of their motion instantaneously as soon as objects start to move. Extensi ve experiments demonstrate superior performance compared to standard 3D motion e stimation approaches particularly highlighting our method's specialized treatmen t of subtle motion.

CORE-MPI: Consistency Object Removal with Embedding MultiPlane Image
Donggeun Yoon, Donghyeon Cho; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 20081-20090
Novel view synthesis is attractive for social media but it often contains unwant ed details such as personal information that needs to be edited out for a better experience. Multiplane image (MPI) is desirable for social media because of its generality but it is complex and computationally expensive making object remova l challenging. To address these challenges we propose CORE-MPI which employs emb edding images to improve the consistency and accessibility of MPI object removal

. CORE-MPI allows for real-time transmission and interaction with embedding imag
es on social media facilitating object removal with a single mask. However recov
ering the geometric information hidden in the embedding images is a significant
challenge. Therefore we propose a dual-network approach where one network focuse
s on color restoration and the other on inpainting the embedding image including
 geometric information. For the training of CORE-MPI we introduce a pseudo-refer
ence loss aimed at proficient color recovery even in complex scenes or with larg
e masks. Furthermore we present a disparity consistency loss to preserve the geo
metric consistency of the inpainted region. We demonstrate the effectiveness of
CORE-MPI on RealEstate10K and UCSD datasets.

3D Geometry-Aware Deformable Gaussian Splatting for Dynamic View Synthesis
Zhicheng Lu, Xiang Guo, Le Hui, Tianrui Chen, Min Yang, Xiao Tang, Feng Zhu, Yuc
hao Dai; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern R
ecognition (CVPR), 2024, pp. 8900-8910
In this paper we propose a 3D geometry-aware deformable Gaussian Splatting metho
d for dynamic view synthesis. Existing neural radiance fields (NeRF) based solut
ions learn the deformation in an implicit manner which cannot incorporate 3D sce
ne geometry. Therefore the learned deformation is not necessarily geometrically
coherent which results in unsatisfactory dynamic view synthesis and 3D dynamic r
econstruction. Recently 3D Gaussian Splatting provides a new representation of t
he 3D scene building upon which the 3D geometry could be exploited in learning t
he complex 3D deformation. Specifically the scenes are represented as a collecti
on of 3D Gaussian where each 3D Gaussian is optimized to move and rotate over ti
me to model the deformation. To enforce the 3D scene geometry constraint during
deformation we explicitly extract 3D geometry features and integrate them in lea
rning the 3D deformation. In this way our solution achieves 3D geometry-aware de
formation modeling which enables improved dynamic view synthesis and 3D dynamic
reconstruction. Extensive experimental results on both synthetic and real datase
ts prove the superiority of our solution which achieves new state-of-the-art per
formance. The project is available at \href https://npucvr.github.io/GaGS/ http
s://npucvr.github.io/GaGS/ .

Person-in-WiFi 3D: End-to-End Multi-Person 3D Pose Estimation with Wi-Fi
Kangwei Yan, Fei Wang, Bo Qian, Han Ding, Jinsong Han, Xing Wei; Proceedings of
the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024,
 pp. 969-978
Wi-Fi signals in contrast to cameras offer privacy protection and occlusion resi
lience for some practical scenarios such as smart homes elderly care and virtual
 reality. Recent years have seen remarkable progress in the estimation of single
-person 2D pose single-person 3D pose and multi-person 2D pose. This paper takes
 a step forward by introducing Person-in-WiFi 3D a pioneering Wi-Fi system that
accomplishes multi-person 3D pose estimation. Person-in-WiFi 3D has two main upd
ates. Firstly it has a greater number of Wi-Fi devices to enhance the capability
 for capturing spatial reflections from multiple individuals. Secondly it levera
ges the Transformer for end-to-end estimation. Compared to its predecessor Perso
n-in-WiFi 3D is storage-efficient and fast. We deployed a proof-of-concept syste
m in 4mx3.5m areas and collected a dataset of over 97K frames with seven volunte
ers. Person-in-WiFi 3D attains 3D joint localization errors of 91.7mm (1-person)
 108.1mm (2-person) and 125.3mm (3-person) comparable to cameras and millimeter-
wave radars.

Backpropagation-free Network for 3D Test-time Adaptation
Yanshuo Wang, Ali Cheraghian, Zeeshan Hayder, Jie Hong, Sameera Ramasinghe, Shaf
in Rahman, David Ahmedt-Aristizabal, Xuesong Li, Lars Petersson, Mehrtash Harand
i; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recogni
tion (CVPR), 2024, pp. 23231-23241
Real-world systems often encounter new data over time which leads to experiencin
g target domain shifts. Existing Test-Time Adaptation (TTA) methods tend to appl
y computationally heavy and memory-intensive backpropagation-based approaches to

handle this. Here we propose a novel method that uses a backpropagation-free ap proach for TTA for the specific case of 3D data. Our model uses a two-stream arc hitecture to maintain knowledge about the source domain as well as complementary target-domain-specific information. The backpropagation-free property of our mo del helps address the well-known forgetting problem and mitigates the error accu mulation issue. The proposed method also eliminates the need for the usually noi sy process of pseudo-labeling and reliance on costly self-supervised training. M oreover our method leverages subspace learning effectively reducing the distribu tion variance between the two domains. Furthermore the source-domain-specific an d the target-domain-specific streams are aligned using a novel entropy-based ada ptive fusion strategy. Extensive experiments on popular benchmarks demonstrate t he effectiveness of our method. The code will be available at https://github.com /abie-e/BFTT3D.

Resource-Efficient Transformer Pruning for Finetuning of Large Models
Fatih Ilhan, Gong Su, Selim Furkan Tekin, Tiansheng Huang, Sihao Hu, Ling Liu; P roceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 16206-16215
With the recent advances in vision transformers and large language models (LLMs) finetuning costly large models on downstream learning tasks poses significant c hallenges under limited computational resources. This paper presents a REsource and ComputAtion-efficient Pruning framework (RECAP) for the finetuning of transf ormer-based large models. RECAP by design bridges the gap between efficiency and performance through an iterative process cycling between pruning finetuning and updating stages to explore different chunks of the given large-scale model. At each iteration we first prune the model with Taylor-approximation-based importan ce estimation and then only update a subset of the pruned model weights based on the Fisher-information criterion. In this way RECAP achieves two synergistic an d yet conflicting goals: reducing the GPU memory footprint while maintaining mod el performance unlike most existing pruning methods that require the model to be finetuned beforehand for better preservation of model performance. We perform e xtensive experiments with a wide range of large transformer-based architectures on various computer vision and natural language understanding tasks. Compared to recent pruning techniques we demonstrate that RECAP offers significant improvem ents in GPU memory efficiency capable of reducing the footprint by up to 65%.

ParamISP: Learned Forward and Inverse ISPs using Camera Parameters
Woohyeok Kim, Geonu Kim, Junyong Lee, Seungyong Lee, Seung-Hwan Baek, Sunghyun C ho; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recogn ition (CVPR), 2024, pp. 26067-26076
RAW images are rarely shared mainly due to its excessive data size compared to t heir sRGB counterparts obtained by camera ISPs. Learning the forward and inverse processes of camera ISPs has been recently demonstrated enabling physically-mea ningful RAW-level image processing on input sRGB images. However existing learni ng-based ISP methods fail to handle the large variations in the ISP processes wi th respect to camera parameters such as ISO and exposure time and have limitatio ns when used for various applications. In this paper we propose ParamISP a learn ing-based method for forward and inverse conversion between sRGB and RAW images that adopts a novel neural-network module to utilize camera parameters which is dubbed as ParamNet. Given the camera parameters provided in the EXIF data ParamN et converts them into a feature vector to control the ISP networks. Extensive ex periments demonstrate that ParamISP achieve superior RAW and sRGB reconstruction results compared to previous methods and it can be effectively used for a varie ty of applications such as deblurring dataset synthesis raw deblurring HDR recon struction and camera-to-camera transfer.

Perturbing Attention Gives You More Bang for the Buck: Subtle Imaging Perturbati ons That Efficiently Fool Customized Diffusion Models
Jingyao Xu, Yuetong Lu, Yandong Li, Siyang Lu, Dongdong Wang, Xiang Wei; Proceed ings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR

), 2024, pp. 24534-24543
Diffusion models (DMs) embark a new era of generative modeling and offer more op portunities for efficient generating high-quality and realistic data samples. Ho wever their widespread use has also brought forth new challenges in model securi ty which motivates the creation of more effective adversarial attackers on DMs t o understand its vulnerability. We propose CAAT a simple but generic and efficie nt approach that does not require costly training to effectively fool latent dif fusion models (LDMs). The approach is based on the observation that cross-attent ion layers exhibits higher sensitivity to gradient change allowing for leveragin g subtle perturbations on published images to significantly corrupt the generate d images. We show that a subtle perturbation on an image can significantly impac t the cross-attention layers thus changing the mapping between text and image du ring the fine-tuning of customized diffusion models. Extensive experiments demon strate that CAAT is compatible with diverse diffusion models and outperforms bas eline attack methods in a more effective (more noise) and efficient (twice as fa st as Anti-DreamBooth and Mist) manner.
****
Fairy: Fast Parallelized Instruction-Guided Video-to-Video Synthesis
Bichen Wu, Ching-Yao Chuang, Xiaoyan Wang, Yichen Jia, Kapil Krishnakumar, Tong Xiao, Feng Liang, Licheng Yu, Peter Vajda; Proceedings of the IEEE/CVF Conferenc e on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 8261-8270
In this paper we introduce Fairy a minimalist yet robust adaptation of image-edi ting diffusion models enhancing them for video editing applications. Our approac h centers on the concept of anchor-based cross-frame attention a mechanism that implicitly propagates diffusion features across frames ensuring superior tempora l coherence and high-fidelity synthesis. Fairy not only addresses limitations of previous models including memory and processing speed. It also improves tempora l consistency through a unique data augmentation strategy. This strategy renders the model equivariant to affine transformations in both source and target image s. Remarkably efficient Fairy generates 120-frame 512x384 videos (4-second durat ion at 30 FPS) in just 14 seconds outpacing prior works by at least 44x. A compr ehensive user study involving 1000 generated samples confirms that our approach delivers superior quality decisively outperforming established methods.

SmartEdit: Exploring Complex Instruction-based Image Editing with Multimodal Lar ge Language Models
Yuzhou Huang, Liangbin Xie, Xintao Wang, Ziyang Yuan, Xiaodong Cun, Yixiao Ge, J iantao Zhou, Chao Dong, Rui Huang, Ruimao Zhang, Ying Shan; Proceedings of the I EEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 8362-8371
Current instruction-based image editing methods such as InstructPix2Pix often fa il to produce satisfactory results in complex scenarios due to their dependence on the simple CLIP text encoder in diffusion models. To rectify this this paper introduces SmartEdit a novel approach of instruction-based image editing that le verages Multimodal Large Language Models (MLLMs) to enhance its understanding an d reasoning capabilities. However direct integration of these elements still fac es challenges in situations requiring complex reasoning. To mitigate this we pro pose a Bidirectional Interaction Module (BIM) that enables comprehensive bidirec tional information interactions between the input image and the MLLM output. Dur ing training we initially incorporate perception data to boost the perception an d understanding capabilities of diffusion models. Subsequently we demonstrate th at a small amount of complex instruction editing data can effectively stimulate SmartEdit's editing capabilities for more complex instructions. We further const ruct a new evaluation dataset Reason-Edit specifically tailored for complex inst ruction-based image editing. Both quantitative and qualitative results on this e valuation dataset indicate that our SmartEdit surpasses previous methods paving the way for the practical application of complex instruction-based image editing .

SeNM-VAE: Semi-Supervised Noise Modeling with Hierarchical Variational Autoencod

er
Dihan Zheng, Yihang Zou, Xiaowen Zhang, Chenglong Bao; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 25889-25899
The data bottleneck has emerged as a fundamental challenge in learning based image restoration methods. Researchers have attempted to generate synthesized training data using paired or unpaired samples to address this challenge. This study proposes SeNM-VAE a semi-supervised noise modeling method that leverages both paired and unpaired datasets to generate realistic degraded data. Our approach is based on modeling the conditional distribution of degraded and clean images with a specially designed graphical model. Under the variational inference framework we develop an objective function for handling both paired and unpaired data. We employ our method to generate paired training samples for real-world image denoising and super-resolution tasks. Our approach excels in the quality of synthetic degraded images compared to other unpaired and paired noise modeling methods. Furthermore our approach demonstrates remarkable performance in downstream image restoration tasks even with limited paired data. With more paired data our method achieves the best performance on the SIDD dataset.

Multimodal Industrial Anomaly Detection by Crossmodal Feature Mapping
Alex Costanzino, Pierluigi Zama Ramirez, Giuseppe Lisanti, Luigi Di Stefano; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 17234-17243
Recent advancements have shown the potential of leveraging both point clouds and images to localize anomalies. Nevertheless their applicability in industrial manufacturing is often constrained by significant drawbacks such as the use of memory banks which leads to a substantial increase in terms of memory footprint and inference times. We propose a novel light and fast framework that learns to map features from one modality to the other on nominal samples and detect anomalies by pinpointing inconsistencies between observed and mapped features. Extensive experiments show that our approach achieves state-of-the-art detection and segmentation performance in both the standard and few-shot settings on the MVTec 3D-AD dataset while achieving faster inference and occupying less memory than previous multimodal AD methods. Furthermore we propose a layer pruning technique to improve memory and time efficiency with a marginal sacrifice in performance.
****
FFF: Fixing Flawed Foundations in Contrastive Pre-Training Results in Very Strong Vision-Language Models
Adrian Bulat, Yassine Ouali, Georgios Tzimiropoulos; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 14172-14182
Despite noise and caption quality having been acknowledged as important factors impacting vision-language contrastive pre-training in this paper we show that the full potential of improving the training process by addressing such issues is yet to be realized. Specifically we firstly study and analyze two issues affecting training: incorrect assignment of negative pairs and low caption quality and diversity. Then we devise effective solutions for addressing both problems which essentially require training with multiple true positive pairs. Finally we propose training with sigmoid loss to address such a requirement. We show very large gains over the current state-of-the-art for both image recognition (+6% on average over 11 datasets) and image retrieval (+19% on Flickr30k and +15% on MSCOCO).

Anchor-based Robust Finetuning of Vision-Language Models
Jinwei Han, Zhiwen Lin, Zhongyisun Sun, Yingguo Gao, Ke Yan, Shouhong Ding, Yuan Gao, Gui-Song Xia; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 26919-26928
We aim at finetuning a vision-language model without hurting its out-of-distribution (OOD) generalization. We address two types of OOD generalization i.e. i) domain shift such as natural to sketch images and ii) zero-shot capability to reco

gnize the category that was not contained in the finetune data. Arguably the dim inished OOD generalization after finetuning stems from the excessively simplifie d finetuning target which only provides the class information such as "a photo o f a [CLASS]". This is distinct from the process in that CLIP was pretrained wher e there is abundant text supervision with rich semantic information. Therefore w e propose to compensate for the finetune process using auxiliary supervision wit h rich semantic information which acts as anchors to preserve the OOD generaliza tion. Specifically two types of anchors are elaborated in our methods including i) text-compensated anchor which uses the images from the finetune set but enric hes the text supervision from a pretrained captioner ii) image-text-pair anchor which is retrieved from the dataset similar to pretraining data of CLIP accordin g to the downstream task associating with the original CLIP text with rich seman tics. Those anchors are utilized as auxiliary semantic information to maintain t he original feature space of CLIP thereby preserving the OOD generalization capa bilities. Comprehensive experiments demonstrate that our method achieves in-dist ribution performance akin to conventional finetuning while attaining new state-o f-the-art results on domain shift and zero-shot learning benchmarks.

Low-power Continuous Remote Behavioral Localization with Event Cameras
Friedhelm Hamann, Suman Ghosh, Ignacio Juarez Martinez, Tom Hart, Alex Kacelnik, Guillermo Gallego; Proceedings of the IEEE/CVF Conference on Computer Vision an d Pattern Recognition (CVPR), 2024, pp. 18612-18621
Researchers in natural science need reliable methods for quantifying animal beha vior. Recently numerous computer vision methods emerged to automate the process. However observing wild species at remote locations remains a challenging task d ue to difficult lighting conditions and constraints on power supply and data sto rage. Event cameras offer unique advantages for battery-dependent remote monitor ing due to their low power consumption and high dynamic range capabilities. We u se this novel sensor to quantify a behavior in Chinstrap penguins called ecstati c display. We formulate the problem as a temporal action detection task determin ing the start and end times of the behavior. For this purpose we recorded a colo ny of breeding penguins in Antarctica for several weeks and labeled event data o n 16 nests. The developed method consists of a generator of candidate time inter vals (proposals) and a classifier of the actions within them. The experiments sh ow that the event cameras' natural response to motion is effective for continuou s behavior monitoring and detection reaching a mean average precision (mAP) of 5 8% (which increases to 63% in good weather conditions). The results also demonst rate the robustness against various lighting conditions contained in the challen ging dataset. The low-power capabilities of the event camera allow it to record significantly longer than with a conventional camera. This work pioneers the use of event cameras for remote wildlife observation opening new interdisciplinary opportunities. https:// tub-rip.github.io/ eventpenguins/

SportsHHI: A Dataset for Human-Human Interaction Detection in Sports Videos
Tao Wu, Runyu He, Gangshan Wu, Limin Wang; Proceedings of the IEEE/CVF Conferenc e on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 18537-18546
Video-based visual relation detection tasks such as video scene graph generation play important roles in fine-grained video understanding. However current video visual relation detection datasets have two main limitations that hinder the pr ogress of research in this area. First they do not explore complex human-human i nteractions in multi-person scenarios. Second the relation types of existing dat asets have relatively low-level semantics and can be often recognized by appeara nce or simple prior information without the need for detailed spatio-temporal co ntext reasoning. Nevertheless comprehending high-level interactions between huma ns is crucial for understanding complex multi-person videos such as sports and s urveillance videos. To address this issue we propose a new video visual relation detection task: video human-human interaction detection and build a dataset nam ed SportsHHI for it. SportsHHI contains 34 high-level interaction classes from b asketball and volleyball sports. 118075 human bounding boxes and 50649 interacti on instances are annotated on 11398 keyframes. To benchmark this we propose a tw

o-stage baseline method and conduct extensive experiments to reveal the key fact ors for a successful human-human interaction detector. We hope that SportsHHI ca n stimulate research on human interaction understanding in videos and promote th e development of spatio-temporal context modeling techniques in video visual rel ation detection.

DiSR-NeRF: Diffusion-Guided View-Consistent Super-Resolution NeRF
Jie Long Lee, Chen Li, Gim Hee Lee; Proceedings of the IEEE/CVF Conference on Co mputer Vision and Pattern Recognition (CVPR), 2024, pp. 20561-20570
We present DiSR-NeRF a diffusion-guided framework for view-consistent super-reso lution (SR) NeRF. Unlike prior works we circumvent the requirement for high-reso lution (HR) reference images by leveraging existing powerful 2D super-resolution models. Nonetheless independent SR 2D images are often inconsistent across diff erent views. We thus propose Iterative 3D Synchronization (I3DS) to mitigate the inconsistency problem via the inherent multi-view consistency property of NeRF. Specifically our I3DS alternates between upscaling low-resolution (LR) rendered images with diffusion models and updating the underlying 3D representation with standard NeRF training. We further introduce Renoised Score Distillation (RSD) a novel score-distillation objective for 2D image resolution. Our RSD combines f eatures from ancestral sampling and Score Distillation Sampling (SDS) to generat e sharp images that are also LR-consistent. Qualitative and quantitative results on both synthetic and real-world datasets demonstrate that our DiSR-NeRF can ac hieve better results on NeRF super-resolution compared with existing works. Code and video results available at the project website.

Dispersed Structured Light for Hyperspectral 3D Imaging
Suhyun Shin, Seokjun Choi, Felix Heide, Seung-Hwan Baek; Proceedings of the IEEE /CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 249 97-25006
Hyperspectral 3D imaging aims to acquire both depth and spectral information of a scene. However existing methods are either prohibitively expensive and bulky o r compromise on spectral and depth accuracy. In this paper we present Dispersed Structured Light (DSL) a cost-effective and compact method for accurate hyperspe ctral 3D imaging. DSL modifies a traditional projector-camera system by placing a sub-millimeter thick diffraction grating film front of the projector. This con figuration enables dispersing structured light based on light wavelength. To uti lize the dispersed structured light we devise a model for dispersive projection image formation and a per-pixel hyperspectral 3D reconstruction method. We valid ate DSL by instantiating a compact experimental prototype. DSL achieves spectral accuracy of 18.8nm full-width half-maximum (FWHM) and depth error of 1mm outper forming prior work on practical hyperspectral 3D imaging. DSL promises accurate and practical hyperspectral 3D imaging for diverse application domains including computer vision and graphics cultural heritage geology and biology.

CrowdDiff: Multi-hypothesis Crowd Density Estimation using Diffusion Models
Yasiru Ranasinghe, Nithin Gopalakrishnan Nair, Wele Gedara Chaminda Bandara, Vis hal M. Patel; Proceedings of the IEEE/CVF Conference on Computer Vision and Patt ern Recognition (CVPR), 2024, pp. 12809-12819
Crowd counting is a fundamental problem in crowd analysis which is typically acc omplished by estimating a crowd density map and summing over the density values. However this approach suffers from background noise accumulation and loss of de nsity due to the use of broad Gaussian kernels to create the ground truth densit y maps. This issue can be overcome by narrowing the Gaussian kernel. However exi sting approaches perform poorly when trained with ground truth density maps with broad kernels. To deal with this limitation we propose using conditional diffus ion models to predict density maps as diffusion models show high fidelity to tra ining data during generation. With that we present CrowdDiff that generates the crowd density map as a reverse diffusion process. Furthermore as the intermediat e time steps of the diffusion process are noisy we incorporate a regression bran ch for direct crowd estimation only during training to improve the feature learn

ing. In addition owing to the stochastic nature of the diffusion model we introd uce producing multiple density maps to improve the counting performance contrary to the existing crowd counting pipelines. We conduct extensive experiments on p ublicly available datasets to validate the effectiveness of our method. CrowdDif f outperforms existing \sota crowd counting methods on several public crowd anal ysis benchmarks with significant improvements. CrowdDiff project is available at : https://dylran.github.io/crowddiff.github.io.

GLID: Pre-training a Generalist Encoder-Decoder Vision Model
Jihao Liu, Jinliang Zheng, Yu Liu, Hongsheng Li; Proceedings of the IEEE/CVF Con ference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 22851-22860
This paper proposes a GeneraLIst encoder-Decoder (GLID) pre-training method for better handling various downstream computer vision tasks. While self-supervised pre-training approaches e.g. Masked Autoencoder have shown success in transfer l earning task-specific sub-architectures are still required to be appended for di fferent downstream tasks which cannot enjoy the benefits of large-scale pre-trai ning. GLID overcomes this challenge by allowing the pre-trained generalist encod er-decoder to be fine-tuned on various vision tasks with minimal task-specific a rchitecture modifications. In the GLID training scheme pre-training pretext task and other downstream tasks are modeled as "query-to-answer" problems including the pre-training pretext task and other downstream tasks. We pre-train a task-ag nostic encoder-decoder with query-mask pairs. During fine-tuning GLID maintains the pre-trained encoder-decoder and queries only replacing the topmost linear tr ansformation layer with task-specific linear heads. This minimizes the pretrain-finetune architecture inconsistency and enables the pre-trained model to better adapt to downstream tasks. GLID achieves competitive performance on various visi on tasks including object detection image segmentation pose estimation and depth estimation outperforming or matching specialist models such as Mask2Former DETR ViTPose and BinsFormer.

Diffusion-FOF: Single-View Clothed Human Reconstruction via Diffusion-Based Four ier Occupancy Field
Yuanzhen Li, Fei Luo, Chunxia Xiao; Proceedings of the IEEE/CVF Conference on Co mputer Vision and Pattern Recognition (CVPR), 2024, pp. 9525-9534
Reconstructing a clothed human from a single-view image has several challenging issues including flexibly representing various body shapes and poses estimating complete 3D geometry and consistent texture and achieving more fine-grained deta ils. To address them we propose a new diffusion-based Fourier occupancy field me thod to improve the human representing ability and the geometry generating abili ty. First we estimate the back-view image from the given reference image by inco rporating a style consistency constraint. Then we extract multi-scale features o

f the two images as conditional and design a diffusion model to generate the Fou
rier occupancy field in the wavelet domain. We refine the initial estimated Four
ier occupancy field with image features as conditions to improve the geometric a
ccuracy. Finally the reference and estimated back-view images are mapped onto th
e human model creating a textured clothed human model. Substantial experiments a
re conducted and the experimental results show that our method outperforms the s
tate-of-the-art methods in geometry and texture reconstruction performance.

When StyleGAN Meets Stable Diffusion: a W+ Adapter for Personalized Image Genera
tion
Xiaoming Li, Xinyu Hou, Chen Change Loy; Proceedings of the IEEE/CVF Conference
on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 2187-2196
Text-to-image diffusion models have remarkably excelled in producing diverse hig
h-quality and photo-realistic images. This advancement has spurred a growing int
erest in incorporating specific identities into generated content. Most current
methods employ an inversion approach to embed a target visual concept into the t
ext embedding space using a single reference image. However the newly synthesize
d faces either closely resemble the reference image in terms of facial attribute
s such as expression or exhibit a reduced capacity for identity preservation. Te
xt descriptions intended to guide the facial attributes of the synthesized face
may fall short owing to the intricate entanglement of identity information with
identity-irrelevant facial attributes derived from the reference image. To addre
ss these issues we present the novel use of the extended StyleGAN embedding spac
e \mathcal W _+ to achieve enhanced identity preservation and disentanglement fo
r diffusion models. By aligning this semantically meaningful human face latent s
pace with text-to-image diffusion models we succeed in maintaining high fidelity
in identity preservation coupled with the capacity for semantic editing. Additi
onally we propose new training objectives to balance the influences of both prom
pt and identity conditions ensuring that the identity-irrelevant background rema
ins \lxm negligibly affected during facial attribute modifications. Extensive e
xperiments reveal that our method adeptly generates personalized text-to-image o
utputs that are not only compatible with prompt descriptions but also amenable t
o common StyleGAN editing directions in diverse settings. Our code and model are
available at https://github.com/csxmli2016/w-plus-adapter.

ToNNO: Tomographic Reconstruction of a Neural Network's Output for Weakly Superv
ised Segmentation of 3D Medical Images
Marius Schmidt-Mengin, Alexis Benichoux, Shibeshih Belachew, Nikos Komodakis, Ni
kos Paragios; Proceedings of the IEEE/CVF Conference on Computer Vision and Patt
ern Recognition (CVPR), 2024, pp. 11428-11438
Annotating lots of 3D medical images for training segmentation models is time-co
nsuming. The goal of weakly supervised semantic segmentation is to train segment
ation models without using any ground truth segmentation masks. Our work address
es the case where only image-level categorical labels indicating the presence or
absence of a particular region of interest (such as tumours or lesions) are ava
ilable. Most existing methods rely on class activation mapping (CAM). We propose
a novel approach ToNNO which is based on the Tomographic reconstruction of a Ne
ural Network's Output. Our technique extracts stacks of slices with different an
gles from the input 3D volume feeds these slices to a 2D encoder and applies the
inverse Radon transform in order to reconstruct a 3D heatmap of the encoder's p
redictions. This generic method allows to perform dense prediction tasks on 3D v
olumes using any 2D image encoder. We apply it to weakly supervised medical imag
e segmentation by training the 2D encoder to output high values for slices conta
ining the regions of interest. We test it on four large scale medical image data
sets and outperform 2D CAM methods. We then extend ToNNO by combining tomographi
c reconstruction with CAM methods proposing Averaged CAM and Tomographic CAM whi
ch obtain even better results.

Learning to Navigate Efficiently and Precisely in Real Environments
Guillaume Bono, Hervé Poirier, Leonid Antsfeld, Gianluca Monaci, Boris Chidlovsk

ii, Christian Wolf; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 17837-17846

In the context of autonomous navigation of terrestrial robots the creation of realistic models for agent dynamics and sensing is a widespread habit in the robotics literature and in commercial applications where they are used for model based control and/or for localization and mapping. The more recent Embodied AI literature on the other hand focuses on modular or end-to-end agents trained in simulators like Habitat or AI-Thor where the emphasis is put on photo-realistic rendering and scene diversity but high-fidelity robot motion is assigned a less privileged role. The resulting sim2real gap significantly impacts transfer of the trained models to real robotic platforms. In this work we explore end-to-end training of agents in simulation in settings which minimize the sim2real gap both in sensing and in actuation. Our agent directly predicts (discretized) velocity commands which are maintained through closed-loop control in the real robot. The behavior of the real robot (including the underlying low-level controller) is identified and simulated in a modified Habitat simulator. Noise models for odometry and localization further contribute in lowering the sim2real gap. We evaluate on real navigation scenarios explore different localization and point goal calculation methods and report significant gains in performance and robustness compared to prior work.

CAM Back Again: Large Kernel CNNs from a Weakly Supervised Object Localization Perspective

Shunsuke Yasuki, Masato Taki; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 341-351

Recently convolutional neural networks (CNNs) with large size kernels have attracted much attention in the computer vision field following the success of the Vision Transformers. Large kernel CNNs have been reported to perform well in downstream vision tasks as well as in classification performance. The reason for the high-performance of large kernel CNNs in downstream tasks has been attributed to the large effective receptive field (ERF) produced by large size kernels but this view has not been fully tested. We therefore revisit the performance of large kernel CNNs in downstream task focusing on the weakly supervised object localization (WSOL) task. WSOL a difficult downstream task that is not fully supervised provides a new angle to explore the capabilities of the large kernel CNNs. Our study compares the modern large kernel CNNs ConvNeXt RepLKNet and SLaK to test the validity of the naive expectation that ERF size is important for improving downstream task performance. Our analysis of the factors contributing to high performance provides a different perspective in which the main factor is feature map improvement. Furthermore we find that modern CNNs are robust to the CAM problems of local regions of objects being activated which has long been discussed in WSOL. CAM is the most classic WSOL method but because of the above-mentioned problems it is often used as a baseline method for comparison. However experiments on the CUB-200-2011 dataset show that simply combining a large kernel CNN CAM and simple data augmentation methods can achieve performance (90.99% MaxBoxAcc) comparable to the latest WSOL method which is CNN-based and requires special training or complex post-processing.

VkD: Improving Knowledge Distillation using Orthogonal Projections

Roy Miles, Ismail Elezi, Jiankang Deng; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 15720-15730

Knowledge distillation is an effective method for training small and efficient deep learning models. However the efficacy of a single method can degenerate when transferring to other tasks modalities or even other architectures. To address this limitation we propose a novel constrained feature distillation method. This method is derived from a small set of core principles which results in two emerging components: an orthogonal projection and a task-specific normalisation. Equipped with both of these components our transformer models can outperform all previous methods on ImageNet and reach up to a 4.4% relative improvement over the previous state-of-the-art methods. To further demonstrate the generality of our

method we apply it to object detection and image generation whereby we obtain consistent and substantial performance improvements over state-of-the-art. Code and models are publicly available.

Putting the Object Back into Video Object Segmentation
Ho Kei Cheng, Seoung Wug Oh, Brian Price, Joon-Young Lee, Alexander Schwing; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 3151-3161
We present Cutie a video object segmentation (VOS) network with object-level memory reading which puts the object representation from memory back into the video object segmentation result. Recent works on VOS employ bottom-up pixel-level memory reading which struggles due to matching noise especially in the presence of distractors resulting in lower performance in more challenging data. In contrast Cutie performs top-down object-level memory reading by adapting a small set of object queries. Via those it interacts with the bottom-up pixel features iteratively with a query-based object transformer (qt hence Cutie). The object queries act as a high-level summary of the target object while high-resolution feature maps are retained for accurate segmentation. Together with foreground-background masked attention Cutie cleanly separates the semantics of the foreground object from the background. On the challenging MOSE dataset Cutie improves by 8.7 J&F over XMem with a similar running time and improves by 4.2 J&F over DeAOT while being three times faster. Code is available at: hkchengrex.github.io/Cutie
****
Concept Weaver: Enabling Multi-Concept Fusion in Text-to-Image Models
Gihyun Kwon, Simon Jenni, Dingzeyu Li, Joon-Young Lee, Jong Chul Ye, Fabian Caba Heilbron; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 8880-8889
While there has been significant progress in customizing text-to-image generation models generating images that combine multiple personalized concepts remains challenging. In this work we introduce Concept Weaver a method for composing customized text-to-image diffusion models at inference time. Specifically the method breaks the process into two steps: creating a template image aligned with the semantics of input prompts and then personalizing the template using a concept fusion strategy. The fusion strategy incorporates the appearance of the target concepts into the template image while retaining its structural details. The results indicate that our method can generate multiple custom concepts with higher identity fidelity compared to alternative approaches. Furthermore the method is shown to seamlessly handle more than two concepts and closely follow the semantic meaning of the input prompt without blending appearances across different subjects.

PKU-DyMVHumans: A Multi-View Video Benchmark for High-Fidelity Dynamic Human Modeling
Xiaoyun Zheng, Liwei Liao, Xufeng Li, Jianbo Jiao, Rongjie Wang, Feng Gao, Shiqi Wang, Ronggang Wang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 22530-22540
High-quality human reconstruction and photo-realistic rendering of a dynamic scene is a long-standing problem in computer vision and graphics. Despite considerable efforts invested in developing various capture systems and reconstruction algorithms recent advancements still struggle with loose or oversized clothing and overly complex poses. In part this is due to the challenges of acquiring high-quality human datasets. To facilitate the development of these fields in this paper we present PKU-DyMVHumans a versatile human-centric dataset for high-fidelity reconstruction and rendering of dynamic human scenarios from dense multi-view videos. It comprises 8.2 million frames captured by more than 56 synchronized cameras across diverse scenarios. These sequences comprise 32 human subjects across 45 different scenarios each with a high-detailed appearance and realistic human motion. Inspired by recent advancements in neural radiance field (NeRF)-based scene representations we carefully set up an off-the-shelf framework that is easy to provide those state-of-the-art NeRF-based implementations and benchmark on P

KU-DyMVHumans dataset. It is paving the way for various applications like fine-g rained foreground/background decomposition high-quality human reconstruction and photo-realistic novel view synthesis of a dynamic scene. Extensive studies are performed on the benchmark demonstrating new observations and challenges that em erge from using such high-fidelity dynamic data. The project page and data is av ailable at: https://pku-dymvhumans.github.io.

Cross-Domain Few-Shot Segmentation via Iterative Support-Query Correspondence Mi ning
Jiahao Nie, Yun Xing, Gongjie Zhang, Pei Yan, Aoran Xiao, Yap-Peng Tan, Alex C. Kot, Shijian Lu; Proceedings of the IEEE/CVF Conference on Computer Vision and P attern Recognition (CVPR), 2024, pp. 3380-3390
Cross-Domain Few-Shot Segmentation (CD-FSS) poses the challenge of segmenting no vel categories from a distinct domain using only limited exemplars. In this pape r we undertake a comprehensive study of CD-FSS and uncover two crucial insights: (i) the necessity of a fine-tuning stage to effectively transfer the learned me ta-knowledge across domains and (ii) the overfitting risk during the naive fine- tuning due to the scarcity of novel category examples. With these insights we pr opose a novel cross-domain fine-tuning strategy that addresses the challenging C D-FSS tasks. We first design Bi-directional Few-shot Prediction (BFP) which esta blishes support-query correspondence in a bi-directional manner crafting augment ed supervision to reduce the overfitting risk. Then we further extend BFP into I terative Few-shot Adaptor (IFA) which is a recursive framework to capture the su pport-query correspondence iteratively targeting maximal exploitation of supervi sory signals from the sparse novel category samples. Extensive empirical evaluat ions show that our method significantly outperforms the state-of-the-arts (+7.8%) which verifies that IFA tackles the cross-domain challenges and mitigates the overfitting simultaneously. The code is available at: https://github.com/niejiah ao1998/IFA.

CausalPC: Improving the Robustness of Point Cloud Classification by Causal Effec t Identification
Yuanmin Huang, Mi Zhang, Daizong Ding, Erling Jiang, Zhaoxiang Wang, Min Yang; P roceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 19779-19789
Deep neural networks have demonstrated remarkable performance in point cloud cla ssification. However previous works show they are vulnerable to adversarial pert urbations that can manipulate their predictions. Given the distinctive modality of point clouds various attack strategies have emerged posing challenges for exi sting defenses to achieve effective generalization. In this study we for the fir st time introduce causal modeling to enhance the robustness of point cloud class ification models. Our insight is from the observation that adversarial examples closely resemble benign point clouds from the human perspective. In our causal m odeling we incorporate two critical variables the structural information (standi ng for the key feature leading to the classification) and the hidden confounders (standing for the noise interfering with the classification). The resulting ove rall framework CausalPC consists of three sub-modules to identify the causal eff ect for robust classification. The framework is model-agnostic and adaptable for integration with various point cloud classifiers. Our approach significantly im proves the adversarial robustness of three mainstream point cloud classification models on two benchmark datasets. For instance the classification accuracy for DGCNN on ModelNet40 increases from 29.2% to 72.0% with CausalPC whereas the best -performing baseline achieves only 42.4%.

LASA: Instance Reconstruction from Real Scans using A Large-scale Aligned Shape Annotation Dataset
Haolin Liu, Chongjie Ye, Yinyu Nie, Yingfan He, Xiaoguang Han; Proceedings of th e IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, p p. 20454-20464
Instance shape reconstruction from a 3D scene involves recovering the full geome

tries of multiple objects at the semantic instance level. Many methods leverage data-driven learning due to the intricacies of scene complexity and significant indoor occlusions. Training these methods often requires a large-scale high-quality dataset with aligned and paired shape annotations with real-world scans. Existing datasets are either synthetic or misaligned restricting the performance of data-driven methods on real data. To this end we introduce LASA a Large-scale Aligned Shape Annotation Dataset comprising 10412 high-quality CAD annotations aligned with 920 real-world scene scans from ArkitScenes created manually by professional artists. On this top we propose a novel Diffusion-based Cross-Modal Shape Reconstruction (DisCo) method. It is empowered by a hybrid feature aggregation design to fuse multi-modal inputs and recover high-fidelity object geometries. Besides we present an Occupancy-Guided 3D Object Detection (OccGOD) method and demonstrate that our shape annotations provide scene occupancy clues that can further improve 3D object detection. Supported by LASA extensive experiments show that our methods achieve state-of-the-art performance in both instance-level scene reconstruction and 3D object detection tasks.
****
LaRE^2: Latent Reconstruction Error Based Method for Diffusion-Generated Image Detection
Yunpeng Luo, Junlong Du, Ke Yan, Shouhong Ding; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 17006-17015
The evolution of Diffusion Models has dramatically improved image generation quality making it increasingly difficult to differentiate between real and generated images. This development while impressive also raises significant privacy and security concerns. In response to this we propose a novel Latent REconstruction error guided feature REfinement method (LaRE^2) for detecting the diffusion-generated images. We come up with the Latent Reconstruction Error (LaRE) the first reconstruction-error based feature in the latent space for generated image detection. LaRE surpasses existing methods in terms of feature extraction efficiency while preserving crucial cues required to differentiate between the real and the fake. To exploit LaRE we propose an Error-Guided feature REfinement module (EGRE) which can refine the image feature guided by LaRE to enhance the discriminativeness of the feature. Our EGRE utilizes an align-then-refine mechanism which effectively refines the image feature for generated-image detection from both spatial and channel perspectives. Extensive experiments on the large-scale GenImage benchmark demonstrate the superiority of our LaRE^2 which surpasses the best SoTA method by up to 11.9%/12.1% average ACC/AP across 8 different image generators. LaRE also surpasses existing methods in terms of feature extraction cost delivering an impressive speed enhancement of 8 times.

DiffSCI: Zero-Shot Snapshot Compressive Imaging via Iterative Spectral Diffusion Model
Zhenghao Pan, Haijin Zeng, Jiezhang Cao, Kai Zhang, Yongyong Chen; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 25297-25306
This paper endeavors to advance the precision of snapshot compressive imaging (SCI) reconstruction for multispectral image (MSI). To achieve this we integrate the advantageous attributes of established SCI techniques and an image generative model propose a novel structured zero-shot diffusion model dubbed DiffSCI. DiffSCI leverages the structural insights from the deep prior and optimization-based methodologies complemented by the generative capabilities offered by the contemporary denoising diffusion model. Specifically firstly we employ a pre-trained diffusion model which has been trained on a substantial corpus of RGB images as the generative denoiser within the Plug-and-Play framework for the first time. This integration allows for the successful completion of SCI reconstruction especially in the case that current methods struggle to address effectively. Secondly we systematically account for spectral band correlations and introduce a robust methodology to mitigate wavelength mismatch thus enabling seamless adaptation of the RGB diffusion model to MSIs.Thirdly an accelerated algorithm is implemented to expedite the resolution of the data subproblem. This augmentation not only a

ccelerates the convergence rate but also elevates the quality of the reconstruct ion process.We present extensive testing to show that DiffSCI exhibits discernib le performance enhancements over prevailing self-supervised and zero-shot approa ches surpassing even supervised transformer counterparts across both simulated a nd real datasets. Code is at https://github.com/PAN083/DiffSCI.

DiffSHEG: A Diffusion-Based Approach for Real-Time Speech-driven Holistic 3D Exp ression and Gesture Generation
Junming Chen, Yunfei Liu, Jianan Wang, Ailing Zeng, Yu Li, Qifeng Chen; Proceedi ngs of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR) , 2024, pp. 7352-7361
We propose DiffSHEG a Diffusion-based approach for Speech-driven Holistic 3D Exp ression and Gesture generation. While previous works focused on co-speech gestur e or expression generation individually the joint generation of synchronized exp ressions and gestures remains barely explored. To address this our diffusion-bas ed co-speech motion generation Transformer enables uni-directional information f low from expression to gesture facilitating improved matching of joint expressio n-gesture distributions. Furthermore we introduce an outpainting-based sampling strategy for arbitrary long sequence generation in diffusion models offering fle xibility and computational efficiency. Our method provides a practical solution that produces high-quality synchronized expression and gesture generation driven by speech. Evaluated on two public datasets our approach achieves state-of-the- art performance both quantitatively and qualitatively. Additionally a user study confirms the superiority of our method over prior approaches. By enabling the r eal-time generation of expressive and synchronized motions our method showcases its potential for various applications in the development of digital humans and embodied agents.
****
MeLFusion: Synthesizing Music from Image and Language Cues using Diffusion Model s
Sanjoy Chowdhury, Sayan Nag, K J Joseph, Balaji Vasan Srinivasan, Dinesh Manocha ; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognit ion (CVPR), 2024, pp. 26826-26835
Music is a universal language that can communicate emotions and feelings. It for ms an essential part of the whole spectrum of creative media ranging from movies to social media posts. Machine learning models that can synthesize music are pr edominantly conditioned on textual descriptions of it. Inspired by how musicians compose music not just from a movie script but also through visualizations we p ropose MeLFusion a model that can effectively use cues from a textual descriptio n and the corresponding image to synthesize music. MeLFusion is a text-to-music diffusion model with a novel "visual synapse" which effectively infuses the sema ntics from the visual modality into the generated music. To facilitate research in this area we introduce a new dataset MeLBench and propose a new evaluation me tric IMSM. Our exhaustive experimental evaluation suggests that adding visual in formation to the music synthesis pipeline significantly improves the quality of generated music measured both objectively and subjectively with a relative gain of up to 67.98% on the FAD score. We hope that our work will gather attention to this pragmatic yet relatively under-explored research area.

T4P: Test-Time Training of Trajectory Prediction via Masked Autoencoder and Acto r-specific Token Memory
Daehee Park, Jaeseok Jeong, Sung-Hoon Yoon, Jaewoo Jeong, Kuk-Jin Yoon; Proceedi ngs of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR) , 2024, pp. 15065-15076
Trajectory prediction is a challenging problem that requires considering interac tions among multiple actors and the surrounding environment. While data-driven a pproaches have been used to address this complex problem they suffer from unreli able predictions under distribution shifts during test time. Accordingly several online learning methods have been proposed using regression loss from the groun d truth of observed data leveraging the auto-labeling nature of trajectory predi

ction task. We mainly tackle the following two issues. First previous works underfit and overfit as they only optimize the last layer of motion decoder. To this end we employ the masked autoencoder (MAE) for representation learning to encourage complex interaction modeling in shifted test distribution for updating deeper layers. Second utilizing the sequential nature of driving data we propose an actor-specific token memory that enables the test-time learning of actor-wise motion characteristics. Our proposed method has been validated across various challenging cross-dataset distribution shift scenarios including nuScenes Lyft Waymo and Interaction. Our method surpasses the performance of existing state-of-the-art online learning methods in terms of both prediction accuracy and computational efficiency. The code is available at https://github.com/daeheepark/T4P.
****
Noisy-Correspondence Learning for Text-to-Image Person Re-identification
Yang Qin, Yingke Chen, Dezhong Peng, Xi Peng, Joey Tianyi Zhou, Peng Hu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 27197-27206
Text-to-image person re-identification (TIReID) is a compelling topic in the cross-modal community which aims to retrieve the target person based on a textual query. Although numerous TIReID methods have been proposed and achieved promising performance they implicitly assume the training image-text pairs are correctly aligned which is not always the case in real-world scenarios. In practice the image-text pairs inevitably exist under-correlated or even false-correlated a.k.a noisy correspondence (NC) due to the low quality of the images and annotation errors. To address this problem we propose a novel Robust Dual Embedding method (RDE) that can learn robust visual-semantic associations even with NC. Specifically RDE consists of two main components: 1) A Confident Consensus Division (CCD) module that leverages the dual-grained decisions of dual embedding modules to obtain a consensus set of clean training data which enables the model to learn correct and reliable visual-semantic associations. 2) A Triplet Alignment Loss (TAL) relaxes the conventional Triplet Ranking loss with the hardest negative samples to a log-exponential upper bound over all negative ones thus preventing the model collapse under NC and can also focus on hard-negative samples for promising performance. We conduct extensive experiments on three public benchmarks namely CUHK-PEDES ICFG-PEDES and RSTPReID to evaluate the performance and robustness of our RDE. Our method achieves state-of-the-art results both with and without synthetic noisy correspondences on all three datasets. Code is available at https://github.com/QinYang79/RDE.
****
InstaGen: Enhancing Object Detection by Training on Synthetic Dataset
Chengjian Feng, Yujie Zhong, Zequn Jie, Weidi Xie, Lin Ma; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 14121-14130
In this paper we present a novel paradigm to enhance the ability of object detector e.g. expanding categories or improving detection performance by training on syn- thetic dataset generated from diffusion models. Specifically we integrate an instance-level grounding head into a pre- trained generative diffusion model to augment it with the ability of localising instances in the generated images. The grounding head is trained to align the text embedding of category names with the regional visual feature of the diffusion model using supervision from an off-the-shelf object detector and a novel self-training scheme on (novel) categories not covered by the detector. We conduct thorough experiments to show that this enhanced version of diffusion model termed as InstaGen can serve as a data synthesizer to enhance object detectors by training on its generated samples demonstrating superior performance over existing state-of-the-art methods in open-vocabulary (+4.5 AP) and data-sparse (+1.2 ? 5.2 AP) scenarios.

PanoRecon: Real-Time Panoptic 3D Reconstruction from Monocular Video
Dong Wu, Zike Yan, Hongbin Zha; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 21507-21518
We introduce the Panoptic 3D Reconstruction task a unified and holistic scene un

derstanding task for a monocular video. And we present PanoRecon - a novel frame work to address this new task which realizes an online geometry reconstruction a lone with dense semantic and instance labeling. Specifically PanoRecon increment ally performs panoptic 3D reconstruction for each video fragment consisting of m ultiple consecutive key frames from a volumetric feature representation using fe ed-forward neural networks. We adopt a depth-guided back-projection strategy to sparse and purify the volumetric feature representation. We further introduce a voxel clustering module to get object instances in each local fragment and then design a tracking and fusion algorithm for the integration of instances from dif ferent fragments to ensure temporal coherence. Such design enables our PanoRecon to yield a coherent and accurate panoptic 3D reconstruction. Experiments on Sca nNetV2 demonstrate a very competitive geometry reconstruction result compared wi th state-of-the-art reconstruction methods as well as promising 3D panoptic segm entation result with only RGB input while being real-time. Code is available at: https://github.com/Riser6/PanoRecon.

Visual Point Cloud Forecasting enables Scalable Autonomous Driving
Zetong Yang, Li Chen, Yanan Sun, Hongyang Li; Proceedings of the IEEE/CVF Confer ence on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 14673-14684
In contrast to extensive studies on general vision pre-training for scalable vis ual autonomous driving remains seldom explored. Visual autonomous driving applic ations require features encompassing semantics 3D geometry and temporal informat ion simultaneously for joint perception prediction and planning posing dramatic challenges for pre-training. To resolve this we bring up a new pre-training task termed as visual point cloud forecasting - predicting future point clouds from historical visual input. The key merit of this task captures the synergic learni ng of semantics 3D structures and temporal dynamics. Hence it shows superiority in various downstream tasks. To cope with this new problem we present ViDAR a ge neral model to pre-train downstream visual encoders. It first extracts historica l embeddings by the encoder. These representations are then transformed to 3D ge ometric space via a novel Latent Rendering operator for future point cloud predi ction. Experiments show significant gain in downstream tasks e.g. 3.1% NDS on 3D detection 10% error reduction on motion forecasting and 15% less collision ra te on planning.

Towards Transferable Targeted 3D Adversarial Attack in the Physical World
Yao Huang, Yinpeng Dong, Shouwei Ruan, Xiao Yang, Hang Su, Xingxing Wei; Proceed ings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 24512-24522
Compared with transferable untargeted attacks transferable targeted adversarial attacks could specify the misclassification categories of adversarial samples po sing a greater threat to security-critical tasks. In the meanwhile 3D adversaria l samples due to their potential of multi-view robustness can more comprehensive ly identify weaknesses in existing deep learning systems possessing great applic ation value. However the field of transferable targeted 3D adversarial attacks r emains vacant. The goal of this work is to develop a more effective technique th at could generate transferable targeted 3D adversarial examples filling the gap in this field. To achieve this goal we design a novel framework named TT3D that could rapidly reconstruct from few multi-view images into Transferable Targeted 3D textured meshes. While existing mesh-based texture optimization methods compu

te gradients in the high-dimensional mesh space and easily fall into local optim a leading to unsatisfactory transferability and distinct distortions TT3D innovatively performs dual optimization towards both feature grid and Multi-layer Perceptron (MLP) parameters in the grid-based NeRF space which significantly enhances black-box transferability while enjoying naturalness. Experimental results show that TT3D not only exhibits superior cross-model transferability but also maintains considerable adaptability across different renders and vision tasks. More importantly we produce 3D adversarial examples with 3D printing techniques in the real world and verify their robust performance under various scenarios.

SwitchLight: Co-design of Physics-driven Architecture and Pre-training Framework for Human Portrait Relighting
Hoon Kim, Minje Jang, Wonjun Yoon, Jisoo Lee, Donghyun Na, Sanghyun Woo; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 25096-25106
We introduce a co-designed approach for human portrait relighting that combines a physics-guided architecture with a pre-training framework. Drawing on the Cook-Torrance reflectance model we have meticulously configured the architecture design to precisely simulate light-surface interactions. Furthermore to overcome the limitation of scarce high-quality lightstage data we have developed a self-supervised pre-training strategy. This novel combination of accurate physical modeling and expanded training dataset establishes a new benchmark in relighting realism.
****
DIRECT-3D: Learning Direct Text-to-3D Generation on Massive Noisy 3D Data
Qihao Liu, Yi Zhang, Song Bai, Adam Kortylewski, Alan Yuille; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 6881-6891
We present DIRECT-3D a diffusion-based 3D generative model for creating high-quality 3D assets (represented by Neural Radiance Fields) from text prompts. Unlike recent 3D generative models that rely on clean and well-aligned 3D data limiting them to single or few-class generation our model is directly trained on extensive noisy and unaligned `in-the-wild' 3D assets mitigating the key challenge (i.e. data scarcity) in large-scale 3D generation. In particular DIRECT-3D is a tri-plane diffusion model that integrates two innovations: 1) A novel learning framework where noisy data are filtered and aligned automatically during the training process. Specifically after an initial warm-up phase using a small set of clean data an iterative optimization is introduced in the diffusion process to explicitly estimate the 3D pose of objects and select beneficial data based on conditional density. 2) An efficient 3D representation that is achieved by disentangling object geometry and color features with two separate conditional diffusion models that are optimized hierarchically. Given a prompt input our model generates high-quality high-resolution realistic and complex 3D objects with accurate geometric details in seconds. We achieve state-of-the-art performance in both single-class generation and text-to-3D generation. We also demonstrate that DIRECT-3D can serve as a useful 3D geometric prior of objects for example to alleviate the well-known Janus problem in 2D-lifting methods such as DreamFusion.
****
Synthesize Step-by-Step: Tools Templates and LLMs as Data Generators for Reasoning-Based Chart VQA
Zhuowan Li, Bhavan Jasani, Peng Tang, Shabnam Ghadar; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 13613-13623
Understanding data visualizations like charts and plots requires reasoning about both visual elements and numerics. Although strong in extractive questions current chart visual question answering (chart VQA) models suffer on complex reasoning questions. In this work we address the lack of reasoning ability by data augmentation. We leverage Large Language Models (LLMs) which have shown to have strong reasoning ability as an automatic data annotator that generates question-answer annotations for chart images. The key innovation in our method lies in the Sy

nthesize Step-by-Step strategy: our LLM-based data generator learns to decompose the complex question into step-by-step sub-questions (rationales) which are then used to derive the final answer using external tools i.e. Python. This step-wise generation procedure is trained on synthetic data generated using a template-based QA generation pipeline. Experimental results highlight the significance of the proposed step-by-step generation. By training with the LLM-augmented data (LAMENDA) we significantly enhance the chart VQA models achieving the state-of-the-art accuracy on the ChartQA and PlotQA datasets. In particular our approach improves the accuracy of the previous state-of-the-art approach from 38% to 54% on the human-written questions in the ChartQA dataset which needs strong reasoning. We hope our work underscores the potential of synthetic data and encourages further exploration of data augmentation using LLMs for reasoning-heavy tasks.
****
LayoutLLM: Layout Instruction Tuning with Large Language Models for Document Understanding
Chuwei Luo, Yufan Shen, Zhaoqing Zhu, Qi Zheng, Zhi Yu, Cong Yao; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 15630-15640
Recently leveraging large language models (LLMs) or multimodal large language models (MLLMs) for document understanding has been proven very promising. However previous works that employ LLMs/MLLMs for document understanding have not fully explored and utilized the document layout information which is vital for precise document understanding. In this paper we propose LayoutLLM an LLM/MLLM based method for document understanding. The core of LayoutLLM is a layout instruction tuning strategy which is specially designed to enhance the comprehension and utilization of document layouts. The proposed layout instruction tuning strategy consists of two components: Layout-aware Pre-training and Layout-aware Supervised Fine-tuning. To capture the characteristics of document layout in Layout-aware Pre-training three groups of pre-training tasks corresponding to document-level region-level and segment-level information are introduced. Furthermore a novel module called layout chain-of-thought (LayoutCoT) is devised to enable LayoutLLM to focus on regions relevant to the question and generate accurate answers. LayoutCoT is effective for boosting the performance of document understanding. Meanwhile it brings a certain degree of interpretability which could facilitate manual inspection and correction. Experiments on standard benchmarks show that the proposed LayoutLLM significantly outperforms existing methods that adopt open-source 7B LLMs/MLLMs for document understanding.

ProTeCt: Prompt Tuning for Taxonomic Open Set Classification
Tz-Ying Wu, Chih-Hui Ho, Nuno Vasconcelos; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 16531-16540
Visual-language foundation models like CLIP learn generalized representations that enable zero-shot open-set classification. Few-shot adaptation methods based on prompt tuning have been shown to further improve performance on downstream datasets. However these methods do not fare well in the taxonomic open set (TOS) setting where the classifier is asked to make prediction from label set across different levels of semantic granularity. Frequently they infer incorrect labels at coarser taxonomic class levels even when the inference at the leaf level (original class labels) is correct. To address this problem we propose a prompt tuning technique that calibrates the hierarchical consistency of model predictions. A set of metrics of hierarchical consistency the Hierarchical Consistent Accuracy (HCA) and the Mean Treecut Accuracy (MTA) are first proposed to evaluate TOS model performance. A new Prompt Tuning for Hierarchical Consistency (ProTeCt) technique is then proposed to calibrate classification across label set granularities. Results show that ProTeCt can be combined with existing prompt tuning methods to significantly improve TOS classification without degrading the leaf level classification performance.
****
Adapters Strike Back
Jan-Martin O. Steitz, Stefan Roth; Proceedings of the IEEE/CVF Conference on Com

puter Vision and Pattern Recognition (CVPR), 2024, pp. 23449-23459
Adapters provide an efficient and lightweight mechanism for adapting trained transformer models to a variety of different tasks. However they have often been found to be outperformed by other adaptation mechanisms including low-rank adaptation. In this paper we provide an in-depth study of adapters their internal structure as well as various implementation choices. We uncover pitfalls for using adapters and suggest a concrete improved adapter architecture called Adapter+ that not only outperforms previous adapter implementations but surpasses a number of other more complex adaptation mechanisms in several challenging settings. Despite this our suggested adapter is highly robust and unlike previous work requires little to no manual intervention when addressing a novel scenario. Adapter+ reaches state-of-the-art average accuracy on the VTAB benchmark even without a per-task hyperparameter optimization.

Masked Autoencoders for Microscopy are Scalable Learners of Cellular Biology
Oren Kraus, Kian Kenyon-Dean, Saber Saberian, Maryam Fallah, Peter McLean, Jess Leung, Vasudev Sharma, Ayla Khan, Jia Balakrishnan, Safiye Celik, Dominique Beaini, Maciej Sypetkowski, Chi Vicky Cheng, Kristen Morse, Maureen Makes, Ben Mabey, Berton Earnshaw; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 11757-11768
Featurizing microscopy images for use in biological research remains a significant challenge especially for large-scale experiments spanning millions of images. This work explores the scaling properties of weakly supervised classifiers and self-supervised masked autoencoders (MAEs) when training with increasingly larger model backbones and microscopy datasets. Our results show that ViT-based MAEs outperform weakly supervised classifiers on a variety of tasks achieving as much as a 11.5% relative improvement when recalling known biological relationships curated from public databases. Additionally we develop a new channel-agnostic MAE architecture (CA-MAE) that allows for inputting images of different numbers and orders of channels at inference time. We demonstrate that CA-MAEs effectively generalize by inferring and evaluating on a microscopy image dataset (JUMP-CP) generated under different experimental conditions with a different channel structure than our pretraining data (RPI-93M). Our findings motivate continued research into scaling self-supervised learning on microscopy data in order to create powerful foundation models of cellular biology that have the potential to catalyze advancements in drug discovery and beyond.

OHTA: One-shot Hand Avatar via Data-driven Implicit Priors
Xiaozheng Zheng, Chao Wen, Zhuo Su, Zeran Xu, Zhaohu Li, Yang Zhao, Zhou Xue; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 799-810
In this paper we delve into the creation of one-shot hand avatars attaining high-fidelity and drivable hand representations swiftly from a single image. With the burgeoning domains of the digital human the need for quick and personalized hand avatar creation has become increasingly critical. Existing techniques typically require extensive input data and may prove cumbersome or even impractical in certain scenarios. To enhance accessibility we present a novel method OHTA (One-shot Hand avaTAr) that enables the creation of detailed hand avatars from merely one image. OHTA tackles the inherent difficulties of this data-limited problem by learning and utilizing data-driven hand priors. Specifically we design a hand prior model initially employed for 1) learning various hand priors with available data and subsequently for 2) the inversion and fitting of the target identity with prior knowledge. OHTA demonstrates the capability to create high-fidelity hand avatars with consistent animatable quality solely relying on a single image. Furthermore we illustrate the versatility of OHTA through diverse applications encompassing text-to-avatar conversion hand editing and identity latent space manipulation.

Segment and Caption Anything
Xiaoke Huang, Jianfeng Wang, Yansong Tang, Zheng Zhang, Han Hu, Jiwen Lu, Lijuan

Wang, Zicheng Liu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 13405-13417
We propose a method to efficiently equip the Segment Anything Model (SAM) with the ability to generate regional captions. SAM presents strong generalizability to segment anything while is short for semantic understanding. By introducing a lightweight query-based feature mixer we align the region-specific features with the embedding space of language models for later caption generation. As the number of trainable parameters is small (typically in the order of tens of millions) it costs less computation less memory usage and less communication bandwidth resulting in both fast and scalable training. To address the scarcity problem of regional caption data we propose to first pre-train our model on objection detection and segmentation tasks. We call this step weak supervision pretraining since the pretraining data only contains category names instead of full-sentence descriptions. The weak supervision pretraining allows us to leverage many publicly available object detection and segmentation datasets. We conduct extensive experiments to demonstrate the superiority of our method and validate each design choice. This work serves as a stepping stone towards scaling up regional captioning data and sheds light on exploring efficient ways to augment SAM with regional semantics.
****
Human Motion Prediction Under Unexpected Perturbation
Jiangbei Yue, Baiyi Li, Julien Pettré, Armin Seyfried, He Wang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 1501-1511
We investigate a new task in human motion prediction which is predicting motions under unexpected physical perturbation potentially involving multiple people. Compared with existing research this task involves predicting less controlled unpremeditated and pure reactive motions in response to external impact and how such motions can propagate through people. It brings new challenges such as data scarcity and predicting complex interactions. To this end we propose a new method capitalizing differentiable physics and deep neural networks leading to an explicit Latent Differentiable Physics (LDP) model. Through experiments we demonstrate that LDP has high data efficiency outstanding prediction accuracy strong generalizability and good explainability. Since there is no similar research a comprehensive comparison with 11 adapted baselines from several relevant domains is conducted showing LDP outperforming existing research both quantitatively and qualitatively improving prediction accuracy by as much as 70% and demonstrating significantly stronger generalization.
****
Text-to-3D Generation with Bidirectional Diffusion using both 2D and 3D priors
Lihe Ding, Shaocong Dong, Zhanpeng Huang, Zibin Wang, Yiyuan Zhang, Kaixiong Gong, Dan Xu, Tianfan Xue; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 5115-5124
Most 3D generation research focuses on up-projecting 2D foundation models into the 3D space either by minimizing 2D Score Distillation Sampling (SDS) loss or fine-tuning on multi-view datasets. Without explicit 3D priors these methods often lead to geometric anomalies and multi-view inconsistency. Recently researchers have attempted to improve the genuineness of 3D objects by directly training on 3D datasets albeit at the cost of low-quality texture generation due to the limited texture diversity in 3D datasets. To harness the advantages of both approaches we propose Bidirectional Diffusion (BiDiff) a unified framework that incorporates both a 3D and a 2D diffusion process to preserve both 3D fidelity and 2D texture richness respectively. Moreover as a simple combination may yield inconsistent generation results we further bridge them with novel bidirectional guidance. In addition our method can be used as an initialization of optimization-based models to further improve the quality of 3D model and efficiency of optimization reducing the process from 3.4 hours to 20 minutes. Experimental results have shown that our model achieves high-quality diverse and scalable 3D generation. Project website https://bidiff.github.io/.

CLIP-Driven Open-Vocabulary 3D Scene Graph Generation via Cross-Modality Contras
tive Learning
Lianggangxu Chen, Xuejiao Wang, Jiale Lu, Shaohui Lin, Changbo Wang, Gaoqi He; P
roceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition
 (CVPR), 2024, pp. 27863-27873
3D Scene Graph Generation (3DSGG) aims to classify objects and their predicates
within 3D point cloud scenes. However current 3DSGG methods struggle with two ma
in challenges. 1) The dependency on labor-intensive ground-truth annotations. 2)
 Closed-set classes training hampers the recognition of novel objects and predic
ates. Addressing these issues our idea is to extract cross-modality features by
CLIP from text and image data naturally related to 3D point clouds. Cross-modali
ty features are used to train a robust 3D scene graph (3DSG) feature extractor.
Specifically we propose a novel Cross-Modality Contrastive Learning 3DSGG (CCL-3
DSGG) method. Firstly to align the text with 3DSG the text is parsed into word l
evel that are consistent with the 3DSG annotation. To enhance robustness during
the alignment adjectives are exchanged for different objects as negative samples
. Then to align the image with 3DSG the camera view is treated as a positive sam
ple and other views as negatives. Lastly the recognition of novel object and pre
dicate classes is achieved by calculating the cosine similarity between prompts
and 3DSG features. Our rigorous experiments confirm the superior open-vocabulary
 capability and applicability of CCL-3DSGG in real-world contexts.

Adversarial Backdoor Attack by Naturalistic Data Poisoning on Trajectory Predict
ion in Autonomous Driving
Mozhgan Pourkeshavarz, Mohammad Sabokrou, Amir Rasouli; Proceedings of the IEEE/
CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 1488
5-14894
In autonomous driving behavior prediction is fundamental for safe motion plannin
g hence the security and robustness of prediction models against adversarial att
acks are of paramount importance. We propose a novel adversarial backdoor attack
 against trajectory prediction models as a means of studying their potential vul
nerabilities. Our attack affects the victim at training time via naturalistic he
nce stealthy poisoned samples crafted using a novel two-step approach. First the
 triggers are crafted by perturbing the trajectory of attacking vehicle and then
 disguised by transforming the scene using a bi-level optimization technique. Th
e proposed attack does not depend on a particular model architecture and operate
s in a black-box manner thus can be effective without any knowledge of the victi
m model. We conduct extensive empirical studies using state-of-the-art predictio
n models on two benchmark datasets using metrics customized for trajectory predi
ction. We show that the proposed attack is highly effective as it can significan
tly hinder the performance of prediction models unnoticeable by the victims and
efficient as it forces the victim to generate malicious behavior even under cons
trained conditions. Via ablative studies we analyze the impact of different atta
ck design choices followed by an evaluation of existing defence mechanisms again
st the proposed attack.

Make-It-Vivid: Dressing Your Animatable Biped Cartoon Characters from Text
Junshu Tang, Yanhong Zeng, Ke Fan, Xuheng Wang, Bo Dai, Kai Chen, Lizhuang Ma; P
roceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition
 (CVPR), 2024, pp. 6243-6253
Creating and animating 3D biped cartoon characters is crucial and valuable in va
rious applications. Compared with geometry the diverse texture design plays an i
mportant role in making 3D biped cartoon characters vivid and charming. Therefor
e we focus on automatic texture design for cartoon characters based on input ins
tructions. This is challenging for domain-specific requirements and a lack of hi
gh-quality data. To address this challenge we propose Make-It-Vivid the first at
tempt to enable high-quality texture generation from text in UV space. We prepar
e a detailed text-texture paired data for 3D characters by using vision-question
-answering agents. Then we customize a pretrained text-to-image model to generat
e texture map with template structure while preserving the natural 2D image know

ledge. Furthermore to enhance fine-grained details we propose a novel adversaria
l learning scheme to shorten the domain gap between original dataset and realist
ic texture domain. Extensive experiments show that our approach outperforms curr
ent texture generation methods resulting in efficient character texturing and fa
ithful generation with prompts. Besides we showcase various applications such as
 out of domain generation and texture stylization. We also provide an efficient
generation system for automatic text-guided textured character generation and an
imation.

StraightPCF: Straight Point Cloud Filtering
Dasith de Silva Edirimuni, Xuequan Lu, Gang Li, Lei Wei, Antonio Robles-Kelly, H
ongdong Li; Proceedings of the IEEE/CVF Conference on Computer Vision and Patter
n Recognition (CVPR), 2024, pp. 20721-20730
Point cloud filtering is a fundamental 3D vision task which aims to remove noise
 while recovering the underlying clean surfaces. State-of-the-art methods remove
 noise by moving noisy points along stochastic trajectories to the clean surface
s. These methods often require regularization within the training objective and/
or during post-processing to ensure fidelity. In this paper we introduce Straigh
tPCF a new deep learning based method for point cloud filtering. It works by mov
ing noisy points along straight paths thus reducing discretization errors while
ensuring faster convergence to the clean surfaces. We model noisy patches as int
ermediate states between high noise patch variants and their clean counterparts
and design the VelocityModule to infer a constant flow velocity from the former
to the latter. This constant flow leads to straight filtering trajectories. In a
ddition we introduce a DistanceModule that scales the straight trajectory using
an estimated distance scalar to attain convergence near the clean surface. Our n
etwork is lightweight and only has 530K parameters being 17% of IterativePFN (a
 most recent point cloud filtering network). Extensive experiments on both synth
etic and real-world data show our method achieves state-of-the-art results. Our
method also demonstrates nice distributions of filtered points without the need
for regularization. The implementation code can be found at: https://github.com/
ddsediri/StraightPCF.
****
Mirasol3B: A Multimodal Autoregressive Model for Time-Aligned and Contextual Mod
alities
AJ Piergiovanni, Isaac Noble, Dahun Kim, Michael S. Ryoo, Victor Gomes, Anelia A
ngelova; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern R
ecognition (CVPR), 2024, pp. 26804-26814
One of the main challenges of multimodal learning is the need to combine heterog
eneous modalities (e.g. video audio text). For example video and audio are obtai
ned at much higher rates than text and are roughly aligned in time. They are oft
en not synchronized with text which comes as a global context e.g. a title or a
description. Furthermore video and audio inputs are of much larger volumes and g
row as the video length increases which naturally requires more compute dedicate
d to these modalities and makes modeling of long-range dependencies harder. We h
ere decouple the multimodal modeling dividing it into separate autoregressive mo
dels processing the inputs according to the characteristics of the modalities. W
e propose a multimodal model consisting of an autoregressive component for the t
ime-synchronized modalities (audio and video) and an autoregressive component fo
r the context modalities which are not necessarily aligned in time but are still
 sequential. To address the long-sequences of the video-audio inputs we further
partition the video and audio sequences in consecutive snippets and autoregressi
vely process their representations. To that end we propose a Combiner mechanism
which models the audio-video information jointly producing compact but expressiv
e representations. This allows us to scale to 512 input video frames without inc
rease in model parameters. Our approach achieves the state-of-the-art on multipl
e well established multimodal benchmarks. It effectively addresses the high comp
utational demand of media inputs by learning compact representations controlling
 the sequence length of the audio-video feature representations and modeling the
ir dependencies in time.

Neural Sign Actors: A Diffusion Model for 3D Sign Language Production from Text
Vasileios Baltatzis, Rolandos Alexandros Potamias, Evangelos Ververas, Guanxiong Sun, Jiankang Deng, Stefanos Zafeiriou; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 1985-1995
Sign Languages (SL) serve as the primary mode of communication for the Deaf and Hard of Hearing communities. Deep learning methods for SL recognition and translation have achieved promising results. However Sign Language Production (SLP) poses a challenge as the generated motions must be realistic and have precise semantic meaning. Most SLP methods rely on 2D data which hinders their realism. In this work a diffusion-based SLP model is trained on a curated large-scale dataset of 4D signing avatars and their corresponding text transcripts. The proposed method can generate dynamic sequences of 3D avatars from an unconstrained domain of discourse using a diffusion process formed on a novel and anatomically informed graph neural network defined on the SMPL-X body skeleton. Through quantitative and qualitative experiments we show that the proposed method considerably outperforms previous methods of SLP. This work makes an important step towards realistic neural sign avatars bridging the communication gap between Deaf and hearing communities.

On the Diversity and Realism of Distilled Dataset: An Efficient Dataset Distillation Paradigm
Peng Sun, Bei Shi, Daiwei Yu, Tao Lin; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 9390-9399
Contemporary machine learning which involves training large neural networks on massive datasets faces significant computational challenges. Dataset distillation as a recent emerging strategy aims to compress real-world datasets for efficient training. However this line of research currently struggles with large-scale and high-resolution datasets hindering its practicality and feasibility. Thus we re-examine existing methods and identify three properties essential for real-world applications: realism diversity and efficiency. As a remedy we propose RDED a novel computationally-efficient yet effective data distillation paradigm to enable both diversity and realism of the distilled data. Extensive empirical results over various model architectures and datasets demonstrate the advancement of RDED: we can distill a dataset to 10 images per class from full ImageNet-1K within 7 minutes achieving a notable 42% accuracy with ResNet-18 on a single RTX-4090 GPU (while the SOTA only achieves 21% but requires 6 hours). Code: https://github.com/LINs-lab/RDED.

Semantics-aware Motion Retargeting with Vision-Language Models
Haodong Zhang, Zhike Chen, Haocheng Xu, Lei Hao, Xiaofei Wu, Songcen Xu, Zhensong Zhang, Yue Wang, Rong Xiong; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 2155-2164
Capturing and preserving motion semantics is essential to motion retargeting between animation characters. However most of the previous works neglect the semantic information or rely on human-designed joint-level representations. Here we present a novel Semantics-aware Motion reTargeting (SMT) method with the advantage of vision-language models to extract and maintain meaningful motion semantics. We utilize a differentiable module to render 3D motions. Then the high-level motion semantics are incorporated into the motion retargeting process by feeding the vision-language model with the rendered images and aligning the extracted semantic embeddings. To ensure the preservation of fine-grained motion details and high-level semantics we adopt a two-stage pipeline consisting of skeleton-aware pre-training and fine-tuning with semantics and geometry constraints. Experimental results show the effectiveness of the proposed method in producing high-quality motion retargeting results while accurately preserving motion semantics. Project page can be found at https://sites.google.com/view/smtnet.

Semantically-Shifted Incremental Adapter-Tuning is A Continual ViTransformer
Yuwen Tan, Qinhao Zhou, Xiang Xiang, Ke Wang, Yuchuan Wu, Yongbin Li; Proceeding

s of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 23252-23262
Class-incremental learning (CIL) aims to enable models to continuously learn new classes while overcoming catastrophic forgetting. The introduction of pre-trained models has brought new tuning paradigms to CIL. In this paper we revisit different parameter-efficient tuning (PET) methods within the context of continual learning. We observe that adapter tuning demonstrates superiority over prompt-based methods even without parameter expansion in each learning session. Motivated by this we propose incrementally tuning the shared adapter without imposing parameter update constraints enhancing the learning capacity of the backbone. Additionally we employ feature sampling from stored prototypes to retrain a unified classifier further improving its performance. We estimate the semantic shift of old prototypes without access to past samples and update stored prototypes session by session. Our proposed method eliminates model expansion and avoids retaining any image samples. It surpasses previous pre-trained model-based CIL methods and demonstrates remarkable continual learning capabilities. Experimental results on five CIL benchmarks validate the effectiveness of our approach achieving state-of-the-art (SOTA) performance.
****
Low-Rank Approximation for Sparse Attention in Multi-Modal LLMs
Lin Song, Yukang Chen, Shuai Yang, Xiaohan Ding, Yixiao Ge, Ying-Cong Chen, Ying Shan; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 13763-13773
This paper focuses on the high computational complexity in Large Language Models (LLMs) a significant challenge in both natural language processing (NLP) and multi-modal tasks. We propose Low-Rank Approximation for Sparse At- tention (LoRA-Sparse) an innovative approach that strate- gically reduces this complexity. LoRA-Sparse introduces low-rank linear projection layers for sparse attention ap- proximation. It utilizes an order-mimic training methodol- ogy which is crucial for efficiently approximating the self- attention mechanism in LLMs. We empirically show that sparse attention not only reduces computational demands but also enhances model performance in both NLP and multi-modal tasks. This surprisingly shows that redundant attention in LLMs might be non-beneficial. We extensively validate LoRA-Sparse through rigorous empirical studies in both (NLP) and multi-modal tasks demonstrating its effec- tiveness and general applicability. Based on LLaMA and LLaVA models our methods can reduce more than half of the self-attention computation with even better performance than full-attention baselines.

TASeg: Temporal Aggregation Network for LiDAR Semantic Segmentation
Xiaopei Wu, Yuenan Hou, Xiaoshui Huang, Binbin Lin, Tong He, Xinge Zhu, Yuexin Ma, Boxi Wu, Haifeng Liu, Deng Cai, Wanli Ouyang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 15311-15320
Training deep models for LiDAR semantic segmentation is challenging due to the inherent sparsity of point clouds. Utilizing temporal data is a natural remedy against the sparsity problem as it makes the input signal denser. However previous multi-frame fusion algorithms fall short in utilizing sufficient temporal information due to the memory constraint and they also ignore the informative temporal images. To fully exploit rich information hidden in long-term temporal point clouds and images we present the Temporal Aggregation Network termed TASeg. Specifically we propose a Temporal LiDAR Aggregation and Distillation (TLAD) algorithm which leverages historical priors to assign different aggregation steps for different classes. It can largely reduce memory and time overhead while achieving higher accuracy. Besides TLAD trains a teacher injected with gt priors to distill the model further boosting the performance. To make full use of temporal images we design a Temporal Image Aggregation and Fusion (TIAF) module which can greatly expand the camera FOV and enhance the present features. Temporal LiDAR points in the camera FOV are used as mediums to transform temporal image features to the present coordinate for temporal multi-modal fusion. Moreover we develop a Static-Moving Switch Augmentation (SMSA) algorithm which utilizes sufficient temporal information to enable objects to switch their motion states freely thus grea

tly increasing static and moving training samples. Our TASeg ranks 1st on three challenging tracks i.e. SemanticKITTI single-scan track multi-scan track and nuScenes LiDAR segmentation track strongly demonstrating the superiority of our method. Codes are available at https://github.com/LittlePey/TASeg.

Bootstrapping SparseFormers from Vision Foundation Models
Ziteng Gao, Zhan Tong, Kevin Qinghong Lin, Joya Chen, Mike Zheng Shou; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 17710-17721
The recently proposed SparseFormer architecture provides an alternative approach to visual understanding by utilizing a significantly lower number of visual tokens via adjusting RoIs greatly reducing computational costs while still achieving promising performance. However training SparseFormers from scratch is still expensive and scaling up the number of parameters can be challenging. In this paper we propose to bootstrap SparseFormers from ViT-based vision foundation models in a simple and efficient way. Since the majority of SparseFormer blocks are the standard transformer ones we can inherit weights from large-scale pre-trained vision transformers and freeze them as much as possible. Therefore we only need to train the SparseFormer-specific lightweight focusing transformer to adjust token RoIs and fine-tune a few early pre-trained blocks to align the final token representation. In such a way we can bootstrap SparseFormer architectures from various large-scale pre-trained models (e.g. IN-21K pre-trained AugRegs or CLIPs) using a rather smaller amount of training samples (e.g. IN-1K) and without labels or captions within just a few hours. As a result the bootstrapped unimodal SparseFormer (from AugReg-ViT-L/16-384) can reach 84.9% accuracy on IN-1K with only 49 tokens and the multimodal SparseFormer from CLIPs also demonstrates notable zero-shot performance with highly reduced computational cost without seeing any caption during the bootstrapping procedure. In addition CLIP-bootstrapped SparseFormers which align the output space with language without seeing a word can serve as efficient vision encoders in multimodal large language models. Code and models are available at https://github.com/showlab/sparseformer

EventPS: Real-Time Photometric Stereo Using an Event Camera
Bohan Yu, Jieji Ren, Jin Han, Feishi Wang, Jinxiu Liang, Boxin Shi; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 9602-9611
Photometric stereo is a well-established technique to estimate the surface normal of an object. However the requirement of capturing multiple high dynamic range images under different illumination conditions limits the speed and real-time applications. This paper introduces EventPS a novel approach to real-time photometric stereo using an event camera. Capitalizing on the exceptional temporal resolution dynamic range and low bandwidth characteristics of event cameras EventPS estimates surface normal only from the radiance changes significantly enhancing data efficiency. EventPS seamlessly integrates with both optimization-based and deep-learning-based photometric stereo techniques to offer a robust solution for non-Lambertian surfaces. Extensive experiments validate the effectiveness and efficiency of EventPS compared to frame-based counterparts. Our algorithm runs at over 30 fps in real-world scenarios unleashing the potential of EventPS in time-sensitive and high-speed downstream applications.
****
Unsupervised Semantic Segmentation Through Depth-Guided Feature Correlation and Sampling
Leon Sick, Dominik Engel, Pedro Hermosilla, Timo Ropinski; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 3637-3646
Traditionally training neural networks to perform semantic segmentation requires expensive human-made annotations. But more recently advances in the field of unsupervised learning have made significant progress on this issue and towards closing the gap to supervised algorithms. To achieve this semantic knowledge is distilled by learning to correlate randomly sampled features from images across an

entire dataset. In this work we build upon these advances by incorporating infor
mation about the structure of the scene into the training process through the us
e of depth information. We achieve this by (1) learning depth-feature correlatio
n by spatially correlating the feature maps with the depth maps to induce knowle
dge about the structure of the scene and (2) exploiting farthest-point sampling
to more effectively select relevant features by utilizing 3D sampling techniques
 on depth information of the scene. Finally we demonstrate the effectiveness of
our technical contributions through extensive experimentation and present signif
icant improvements in performance across multiple benchmark datasets.

On the Road to Portability: Compressing End-to-End Motion Planner for Autonomous
 Driving
Kaituo Feng, Changsheng Li, Dongchun Ren, Ye Yuan, Guoren Wang; Proceedings of t
he IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024,
pp. 15099-15108
End-to-end motion planning models equipped with deep neural networks have shown
great potential for enabling full autonomous driving. However the oversized neur
al networks render them impractical for deployment on resource-constrained syste
ms which unavoidably requires more computational time and resources during refer
ence. To handle this knowledge distillation offers a promising approach that com
presses models by enabling a smaller student model to learn from a larger teache
r model. Nevertheless how to apply knowledge distillation to compress motion pla
nners has not been explored so far. In this paper we propose PlanKD the first kn
owledge distillation framework tailored for compressing end-to-end motion planne
rs. First considering that driving scenes are inherently complex often containin
g planning-irrelevant or even noisy information transferring such information is
 not beneficial for the student planner. Thus we design an information bottlenec
k based strategy to only distill planning-relevant information rather than trans
fer all information indiscriminately. Second different waypoints in an output pl
anned trajectory may hold varying degrees of importance for motion planning wher
e a slight deviation in certain crucial waypoints might lead to a collision. The
refore we devise a safety-aware waypoint-attentive distillation module that assi
gns adaptive weights to different waypoints based on the importance to encourage
 the student to accurately mimic more crucial waypoints thereby improving overal
l safety. Experiments demonstrate that our PlanKD can boost the performance of s
maller planners by a large margin and significantly reduce their reference time.

RAVE: Randomized Noise Shuffling for Fast and Consistent Video Editing with Diff
usion Models
Ozgur Kara, Bariscan Kurtkaya, Hidir Yesiltepe, James M. Rehg, Pinar Yanardag; P
roceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition
 (CVPR), 2024, pp. 6507-6516
Recent advancements in diffusion-based models have demonstrated significant succ
ess in generating images from text. However video editing models have not yet re
ached the same level of visual quality and user control. To address this we intr
oduce RAVE a zero-shot video editing method that leverages pre-trained text-to-i
mage diffusion models without additional training. RAVE takes an input video and
 a text prompt to produce high-quality videos while preserving the original moti
on and semantic structure. It employs a novel noise shuffling strategy leveragin
g spatio-temporal interactions between frames to produce temporally consistent v
ideos faster than existing methods. It is also efficient in terms of memory requ
irements allowing it to handle longer videos. RAVE is capable of a wide range of
 edits from local attribute modifications to shape transformations. In order to
demonstrate the versatility of RAVE we create a comprehensive video evaluation d
ataset ranging from object-focused scenes to complex human activities like danci
ng and typing and dynamic scenes featuring swimming fish and boats. Our qualitat
ive and quantitative experiments highlight the effectiveness of RAVE in diverse
video editing scenarios compared to existing methods. Our code dataset and video
s can be found in \href https://rave-video-edit.github.io/.

PredToken: Predicting Unknown Tokens and Beyond with Coarse-to-Fine Iterative De
coding
Xuesong Nie, Haoyuan Jin, Yunfeng Yan, Xi Chen, Zhihang Zhu, Donglian Qi; Procee
dings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVP
R), 2024, pp. 18143-18152
Predictive learning models which aim to predict future frames based on past obse
rvations are crucial to constructing world models. These models need to maintain
 low-level consistency and capture high-level dynamics in unannotated spatiotemp
oral data. Transitioning from frame-wise to token-wise prediction presents a via
ble strategy for addressing these needs. How to improve token representation and
 optimize token decoding presents significant challenges. This paper introduces
PredToken a novel predictive framework that addresses these issues by decoupling
 space-time tokens into distinct components for iterative cascaded decoding. Con
cretely we first design a "decomposition quantization and reconstruction" schema
 based on VQGAN to improve the token representation. This scheme disentangles lo
w- and high-frequency representations and employs a dimension-aware quantization
 model allowing more low-level details to be preserved. Building on this we pres
ent a "coarse-to-fine iterative decoding" method. It leverages dynamic soft deco
ding to refine coarse tokens and static soft decoding for fine tokens enabling m
ore high-level dynamics to be captured. These designs make PredToken produce hig
h-quality predictions. Extensive experiments demonstrate the superiority of our
method on various real-world spatiotemporal predictive benchmarks. Furthermore P
redToken can also be extended to other visual generative tasks to yield realisti
c outcomes.

Video-Based Human Pose Regression via Decoupled Space-Time Aggregation
Jijie He, Wenwu Yang; Proceedings of the IEEE/CVF Conference on Computer Vision
and Pattern Recognition (CVPR), 2024, pp. 1022-1031
By leveraging temporal dependency in video sequences multi-frame human pose esti
mation algorithms have demonstrated remarkable results in complicated situations
 such as occlusion motion blur and video defocus. These algorithms are predomina
ntly based on heatmaps resulting in high computation and storage requirements pe
r frame which limits their flexibility and real-time application in video scenar
ios particularly on edge devices. In this paper we develop an efficient and effe
ctive video-based human pose regression method which bypasses intermediate repre
sentations such as heatmaps and instead directly maps the input to the output jo
int coordinates. Despite the inherent spatial correlation among adjacent joints
of the human pose the temporal trajectory of each individual joint exhibits rela
tive independence. In light of this we propose a novel Decoupled Space-Time Aggr
egation network (DSTA) to separately capture the spatial contexts between adjace
nt joints and the temporal cues of each individual joint thereby avoiding the co
nflation of spatiotemporal dimensions. Concretely DSTA learns a dedicated featur
e token for each joint to facilitate the modeling of their spatiotemporal depend
encies. With the proposed joint-wise local-awareness attention mechanism our met
hod is capable of efficiently and flexibly utilizing the spatial dependency of a
djacent joints and the temporal dependency of each joint itself. Extensive exper
iments demonstrate the superiority of our method. Compared to previous regressio
n-based single-frame human pose estimation methods DSTA significantly enhances p
erformance achieving an 8.9 mAP improvement on PoseTrack2017. Furthermore our ap
proach either surpasses or is on par with the state-of-the-art heatmap-based mul
ti-frame human pose estimation methods. Project page: https://github.com/zgspose
/DSTA.

L-MAGIC: Language Model Assisted Generation of Images with Coherence
Zhipeng Cai, Matthias Mueller, Reiner Birkl, Diana Wofk, Shao-Yen Tseng, Junda C
heng, Gabriela Ben-Melech Stan, Vasudev Lai, Michael Paulitsch; Proceedings of t
he IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024,
pp. 7049-7058
In the current era of generative AI breakthroughs generating panoramic scenes fr
om a single input image remains a key challenge. Most existing methods use diffu

sion-based iterative or simultaneous multi-view inpainting. However the lack of global scene layout priors leads to subpar outputs with duplicated objects (e.g. multiple beds in a bedroom) or requires time-consuming human text inputs for each view. We propose L-MAGIC a novel method leveraging large language models for guidance while diffusing multiple coherent views of 360 degree panoramic scenes. L-MAGIC harnesses pre-trained diffusion and language models without fine-tuning ensuring zero-shot performance. The output quality is further enhanced by super-resolution and multi-view fusion techniques. Extensive experiments demonstrate that the resulting panoramic scenes feature better scene layouts and perspective view rendering quality compared to related works with >70% preference in human evaluations. Combined with conditional diffusion models L-MAGIC can accept various input modalities including but not limited to text depth maps sketches and colored scripts. Applying depth estimation further enables 3D point cloud generation and dynamic scene exploration with fluid camera motion.

3D Face Tracking from 2D Video through Iterative Dense UV to Image Flow
Felix Taubner, Prashant Raina, Mathieu Tuli, Eu Wern Teh, Chul Lee, Jinmiao Huang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 1227-1237
When working with 3D facial data improving fidelity and avoiding the uncanny valley effect is critically dependent on accurate 3D facial performance capture. Because such methods are expensive and due to the widespread availability of 2D videos recent methods have focused on how to perform monocular 3D face tracking. However these methods often fall short in capturing precise facial movements due to limitations in their network architecture training and evaluation processes. Addressing these challenges we propose a novel face tracker FlowFace that introduces an innovative 2D alignment network for dense per-vertex alignment. Unlike prior work FlowFace is trained on high-quality 3D scan annotations rather than weak supervision or synthetic data. Our 3D model fitting module jointly fits a 3D face model from one or many observations integrating existing neutral shape priors for enhanced identity and expression disentanglement and per-vertex deformations for detailed facial feature reconstruction. Additionally we propose a novel metric and benchmark for assessing tracking accuracy. Our method exhibits superior performance on both custom and publicly available benchmarks. We further validate the effectiveness of our tracker by generating high-quality 3D data from 2D videos which leads to performance gains on downstream tasks.

Carve3D: Improving Multi-view Reconstruction Consistency for Diffusion Models with RL Finetuning
Desai Xie, Jiahao Li, Hao Tan, Xin Sun, Zhixin Shu, Yi Zhou, Sai Bi, Sören Pirk, Arie E. Kaufman; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 6369-6379
Multi-view diffusion models obtained by applying Supervised Finetuning (SFT) to text-to-image diffusion models have driven recent breakthroughs in text-to-3D research. However due to the limited size and quality of existing 3D datasets they still suffer from multi-view inconsistencies and Neural Radiance Field (NeRF) reconstruction artifacts. We argue that multi-view diffusion models can benefit from further Reinforcement Learning Finetuning (RLFT) which allows models to learn from the data generated by themselves and improve beyond their dataset limitations during SFT. To this end we introduce Carve3D an improved RLFT algorithm coupled with a novel Multi-view Reconstruction Consistency (MRC) metric to enhance the consistency of multi-view diffusion models. To measure the MRC metric on a set of multi-view images we compare them with their corresponding NeRF renderings at the same camera viewpoints. The resulting model which we denote as Carve3DM demonstrates superior multi-view consistency and NeRF reconstruction quality than existing models. Our results suggest that pairing SFT with Carve3D's RLFT is essential for developing multi-view-consistent diffusion models mirroring the standard Large Language Model (LLM) alignment pipeline. Our code training and testing data and video results are available at: https://desaixie.github.io/carve-3d.

Random Entangled Tokens for Adversarially Robust Vision Transformer
Huihui Gong, Minjing Dong, Siqi Ma, Seyit Camtepe, Surya Nepal, Chang Xu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 24554-24563
Vision Transformers (ViTs) have emerged as a compelling alternative to Convolutional Neural Networks (CNNs) in the realm of computer vision showcasing tremendous potential. However recent research has unveiled a susceptibility of ViTs to adversarial attacks akin to their CNN counterparts. Adversarial training and randomization are two representative effective defenses for CNNs. Some researchers have attempted to apply adversarial training to ViTs and achieved comparable robustness to CNNs while it is not easy to directly apply randomization to ViTs because of the architecture difference between CNNs and ViTs. In this paper we delve into the structural intricacies of ViTs and propose a novel defense mechanism termed Random entangled image Transformer (ReiT) which seamlessly integrates adversarial training and randomization to bolster the adversarial robustness of ViTs. Recognizing the challenge posed by the structural disparities between ViTs and CNNs we introduce a novel module input-independent random entangled self-attention (II-ReSA). This module optimizes random entangled tokens that lead to "dissimilar" self-attention outputs by leveraging model parameters and the sampled random tokens thereby synthesizing the self-attention module outputs and random entangled tokens to diminish adversarial similarity. ReiT incorporates two distinct random entangled tokens and employs dual randomization offering an effective countermeasure against adversarial examples while ensuring comprehensive deduction guarantees. Through extensive experiments conducted on various ViT variants and benchmarks we substantiate the superiority of our proposed method in enhancing the adversarial robustness of Vision Transformers.

Shadow Generation for Composite Image Using Diffusion Model
Qingyang Liu, Junqi You, Jianting Wang, Xinhao Tao, Bo Zhang, Li Niu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 8121-8130
In the realm of image composition generating realistic shadow for the inserted foreground remains a formidable challenge. Previous works have developed image-to-image translation models which are trained on paired training data. However they are struggling to generate shadows with accurate shapes and intensities hindered by data scarcity and inherent task complexity. In this paper we resort to foundation model with rich prior knowledge of natural shadow images. Specifically we first adapt ControlNet to our task and then propose intensity modulation modules to improve the shadow intensity. Moreover we extend the small-scale DESOBA dataset to DESOBAv2 using a novel data acquisition pipeline. Experimental results on both DESOBA and DESOBAv2 datasets as well as real composite images demonstrate the superior capability of our model for shadow generation task. The dataset code and model are released at https://github.com/bcmi/Object-Shadow-Generation-Dataset-DESOBAv2.

DisCo: Disentangled Control for Realistic Human Dance Generation
Tan Wang, Linjie Li, Kevin Lin, Yuanhao Zhai, Chung-Ching Lin, Zhengyuan Yang, Hanwang Zhang, Zicheng Liu, Lijuan Wang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 9326-9336
Generative AI has made significant strides in computer vision particularly in text-driven image/video synthesis (T2I/T2V). Despite the notable advancements it remains challenging in human-centric content synthesis such as realistic dance generation. Current methodologies primarily tailored for human motion transfer encounter difficulties when confronted with real-world dance scenarios (e.g. social media dance) which require to generalize across a wide spectrum of poses and intricate human details. In this paper we depart from the traditional paradigm of human motion transfer and emphasize two additional critical attributes for the synthesis of human dance content in social media contexts: (i) Generalizability: the model should be able to generalize beyond generic human viewpoints as well as unseen human subjects backgrounds and poses; (ii) Compositionality: it should

allow for the seamless composition of seen/unseen subjects backgrounds and poses from different sources. To address these challenges we introduce DISCO which includes a novel model architecture with disentangled control to improve the compositionality of dance synthesis and an effective human attribute pre-training for better generalizability to unseen humans. Extensive qualitative and quantitative results demonstrate that DISCO can generate high-quality human dance images and videos with diverse appearances and flexible motions. Code is available at https://disco-dance.github.io/.

L2B: Learning to Bootstrap Robust Models for Combating Label Noise
Yuyin Zhou, Xianhang Li, Fengze Liu, Qingyue Wei, Xuxi Chen, Lequan Yu, Cihang Xie, Matthew P. Lungren, Lei Xing; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 23523-23533
Deep neural networks have shown great success in representation learning. Deep neural networks have shown great success in representation learning. However when learning with noisy labels (LNL) they can easily overfit and fail to generalize to new data. This paper introduces a simple and effective method named Learning to Bootstrap (L2B) which enables models to bootstrap themselves using their own predictions without being adversely affected by erroneous pseudo-labels. It achieves this by dynamically adjusting the importance weight between real observed and generated labels as well as between different samples through meta-learning. Unlike existing instance reweighting methods the key to our method lies in a new versatile objective that enables implicit relabeling concurrently leading to significant improvements without incurring additional costs. L2B offers several benefits over the baseline methods. It yields more robust models that are less susceptible to the impact of noisy labels by guiding the bootstrapping procedure more effectively. It better exploits the valuable information contained in corrupted instances by adapting the weights of both instances and labels. Furthermore L2B is compatible with existing LNL methods and delivers competitive results spanning natural and medical imaging tasks including classification and segmentation under both synthetic and real-world noise. Extensive experiments demonstrate that our method effectively mitigates the challenges of noisy labels often necessitating few to no validation samples and is well generalized to other tasks such as image segmentation. This not only positions it as a robust complement to existing LNL techniques but also underscores its practical applicability. The code and models are available at https://github.com/yuyinzhou/l2b.

GaussianShader: 3D Gaussian Splatting with Shading Functions for Reflective Surfaces
Yingwenqi Jiang, Jiadong Tu, Yuan Liu, Xifeng Gao, Xiaoxiao Long, Wenping Wang, Yuexin Ma; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 5322-5332
The advent of neural 3D Gaussians has recently brought about a revolution in the field of neural rendering facilitating the generation of high-quality renderings at real-time speeds. However the explicit and discrete representation encounters challenges when applied to scenes featuring reflective surfaces. In this paper we present GaussianShader a novel method that applies a simplified shading function on 3D Gaussians to enhance the neural rendering in scenes with reflective surfaces while preserving the training and rendering efficiency. The main challenge in applying the shading function lies in the accurate normal estimation on discrete 3D Gaussians. Specifically we proposed a novel normal estimation framework based on the shortest axis directions of 3D Gaussians with a delicately designed loss to make the consistency between the normals and the geometries of Gaussian spheres. Experiments show that GaussianShader strikes a commendable balance between efficiency and visual quality. Our method surpasses Gaussian Splatting in PSNR on specular object datasets exhibiting an improvement of 1.57dB. When compared to prior works handling reflective surfaces such as Ref-NeRF our optimization time is significantly accelerated (23h vs. 0.58h).

Tactile-Augmented Radiance Fields

Yiming Dou, Fengyu Yang, Yi Liu, Antonio Loquercio, Andrew Owens; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 26529-26539
We present a scene representation that brings vision and touch into a shared 3D space which we call a tactile-augmented radiance field. This representation capitalizes on two key insights: (i) ubiquitous vision-based touch sensors are built on perspective cameras and (ii) visually and structurally similar regions of a scene share the same tactile features. We use these insights to train a conditional diffusion model that provided with an RGB image and a depth map rendered from a neural radiance field generates its corresponding tactile "image". To train this diffusion model we collect the largest collection of spatially-aligned visual and tactile data. Through qualitative and quantitative experiments we demonstrate the accuracy of our cross-modal generative model and the utility of collected and rendered visual-tactile pairs across a range of downstream tasks. Project page: https://dou-yiming.github.io/TaRF

Intensity-Robust Autofocus for Spike Camera
Changqing Su, Zhiyuan Ye, Yongsheng Xiao, You Zhou, Zhen Cheng, Bo Xiong, Zhaofei Yu, Tiejun Huang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 25018-25027
Spike cameras a novel neuromorphic visual sensor can capture full-time spatial information through spike stream offering ultra-high temporal resolution and an extensive dynamic range. Autofocus control (AC) plays a pivotal role in a camera to efficiently capture information in challenging real-world scenarios. Nevertheless due to disparities in data modality and information characteristics compared to frame stream and event stream the current lack of efficient AC methods has made it challenging for spike cameras to adapt to intricate real-world conditions. To address this challenge we introduce a spike-based autofocus framework that includes a spike-specific focus measure called spike dispersion (SD) which effectively mitigates the influence of variations in scene light intensity during the focusing process by leveraging the spike camera's ability to record full-time spatial light intensity. Additionally the framework integrates a fast search strategy called spike-based golden fast search (SGFS) allowing rapid focal positioning without the need for a complete focus range traversal. To validate the performance of our method we have collected a spike-based autofocus dataset (SAD) containing synthetic data and real-world data under varying scene brightness and motion scenarios. Experimental results on these datasets demonstrate that our method offers state-of-the-art accuracy and efficiency. Furthermore experiments with data captured under varying scene brightness levels illustrate the robustness of our method to changes in light intensity during the focusing process.

FairCLIP: Harnessing Fairness in Vision-Language Learning
Yan Luo, Min Shi, Muhammad Osama Khan, Muhammad Muneeb Afzal, Hao Huang, Shuaihang Yuan, Yu Tian, Luo Song, Ava Kouhana, Tobias Elze, Yi Fang, Mengyu Wang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 12289-12301
Fairness is a critical concern in deep learning especially in healthcare where these models influence diagnoses and treatment decisions. Although fairness has been investigated in the vision-only domain the fairness of medical vision-language (VL) models remains unexplored due to the scarcity of medical VL datasets for studying fairness. To bridge this research gap we introduce the first fair vision-language medical dataset (Harvard-FairVLMed) that provides detailed demographic attributes ground-truth labels and clinical notes to facilitate an in-depth examination of fairness within VL foundation models. Using Harvard-FairVLMed we conduct a comprehensive fairness analysis of two widely-used VL models (CLIP and BLIP2) pre-trained on both natural and medical domains across four different protected attributes. Our results highlight significant biases in all VL models with Asian Male Non-Hispanic and Spanish being the preferred subgroups across the protected attributes of race gender ethnicity and language respectively. In order to alleviate these biases we propose FairCLIP an optimal-transport-based approa

ch that achieves a favorable trade-off between performance and fairness by reducing the Sinkhorn distance between the overall sample distribution and the distributions corresponding to each demographic group. As the first VL dataset of its kind Harvard-FairVLMed holds the potential to catalyze advancements in the development of machine learning models that are both ethically aware and clinically effective. Our dataset and code are available at https://ophai.hms.harvard.edu/datasets/harvard-fairvlmed10k.

StreamingFlow: Streaming Occupancy Forecasting with Asynchronous Multi-modal Data Streams via Neural Ordinary Differential Equation
Yining Shi, Kun Jiang, Ke Wang, Jiusi Li, Yunlong Wang, Mengmeng Yang, Diange Yang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 14833-14842
Predicting the future occupancy states of the surrounding environment is a vital task for autonomous driving. However current best-performing single-modality methods or multi-modality fusion perception methods are only able to predict uniform snapshots of future occupancy states and require strictly synchronized sensory data for sensor fusion. We propose a novel framework StreamingFlow to lift these strong limitations. StreamingFlow is a novel BEV occupancy predictor that ingests asynchronous multi-sensor data streams for fusion and performs streaming forecasting of the future occupancy map at any future timestamps. By integrating neural ordinary differential equations (N-ODE) into recurrent neural networks StreamingFlow learns derivatives of BEV features over temporal horizons updates the implicit sensor's BEV features as part of the fusion process and propagates BEV states to the desired future time point. It shows good zero-shot generalization ability of prediction reflected in the interpolation of the observed prediction time horizon and the reasonable inference of the unseen farther future period. Extensive experiments on two large-scale datasets nuScenes and Lyft L5 demonstrate that StreamingFlow significantly outperforms previous vision-based LiDAR-based methods and shows superior performance compared to state-of-the-art fusion-based methods.

pix2gestalt: Amodal Segmentation by Synthesizing Wholes
Ege Ozguroglu, Ruoshi Liu, Dídac Surís, Dian Chen, Achal Dave, Pavel Tokmakov, Carl Vondrick; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 3931-3940
We introduce pix2gestalt a framework for zero-shot amodal segmentation which learns to estimate the shape and appearance of whole objects that are only partially visible behind occlusions. By capitalizing on large-scale diffusion models and transferring their representations to this task we learn a conditional diffusion model for reconstructing whole objects in challenging zero-shot cases including examples that break natural and physical priors such as art. As training data we use a synthetically curated dataset containing occluded objects paired with their whole counterparts. Experiments show that our approach outperforms supervised baselines on established benchmarks. Our model can furthermore be used to significantly improve the performance of existing object recognition and 3D reconstruction methods in the presence of occlusions.
****
Weakly Supervised Point Cloud Semantic Segmentation via Artificial Oracle
Hyeokjun Kweon, Jihun Kim, Kuk-Jin Yoon; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 3721-3731
Manual annotation of every point in a point cloud is a costly and labor-intensive process. While weakly supervised point cloud semantic segmentation (WSPCSS) with sparse annotation shows promise the limited information from initial sparse labels can place an upper bound on performance. As a new research direction for WSPCSS we propose a novel Region Exploration via Artificial Labeling (REAL) framework. It leverages a foundational image model as an artificial oracle within the active learning context eliminating the need for manual annotation by a human oracle. To integrate the 2D model into the 3D domain we first introduce a Projection-based Point-toSegment (PP2S) module designed to enable prompt segmentation o

f 3D data without additional training. The REAL framework samples query points based on model predictions and requests annotations from PP2S dynamically refining labels and improving model training. Furthermore to overcome several challenges of employing an artificial model as an oracle we formulate effective query sampling and label updating strategies. Our comprehensive experiments and comparisons demonstrate that the REAL framework significantly outperforms existing methods across various benchmarks. The code is available at https://github.com/jihun1998/AO.

Language Model Guided Interpretable Video Action Reasoning
Ning Wang, Guangming Zhu, HS Li, Liang Zhang, Syed Afaq Ali Shah, Mohammed Bennamoun; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 18878-18887
Although neural networks excel in video action recognition tasks their "black-box" nature makes it challenging to understand the rationale behind their decisions. Recent approaches used inherently interpretable models to analyze video actions in a manner akin to human reasoning. However it has been observed that these interpretable models tend to underperform when compared to their black-box counterparts. In this work we present a new framework called Language-guided Interpretable Action Recognition framework (LaIAR). This framework leverages knowledge from language models to enhance both the recognition capabilities and the interpretability of video models. In essence we reframe the challenge of understanding video model decisions as a task of aligning video and language models. Using the logical reasoning captured by the language model we steer the training of the video model. This integrated approach not only improves the video model's adaptability to different domains but also boosts its overall performance. Extensive experiments on Charades and CAD-120 datasets demonstrate the superior performance and interpretability of our proposed method. The code of LaIAR is available at https://github.com/NingWang2049/LaIAR.

Forecasting of 3D Whole-body Human Poses with Grasping Objects
Haitao Yan, Qiongjie Cui, Jiexin Xie, Shijie Guo; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 1726-1736
In the context of computer vision and human-robot interaction forecasting 3D human poses is crucial for understanding human behavior and enhancing the predictive capabilities of intelligent systems. While existing methods have made significant progress they often focus on predicting major body joints overlooking fine-grained gestures and their interaction with objects. Human hand movements particularly during object interactions play a pivotal role and provide more precise expressions of human poses. This work fills this gap and introduces a novel paradigm: forecasting 3D whole-body human poses with a focus on grasping objects. This task involves predicting activities across all joints in the body and hands encompassing the complexities of internal heterogeneity and external interactivity. To tackle these challenges we also propose a novel approach: C^3HOST cross-context cross-modal consolidation for 3D whole-body pose forecasting effectively handles the complexities of internal heterogeneity and external interactivity. C^3HOST involves distinct steps including the heterogeneous content encoding and alignment and cross-modal feature learning and interaction. These enable us to predict activities across all body and hand joints ensuring high-precision whole-body human pose prediction even during object grasping. Extensive experiments on two benchmarks demonstrate that our model significantly enhances the accuracy of whole-body human motion prediction. The project page is available at https://sites.google.com/view/c3host.

COTR: Compact Occupancy TRansformer for Vision-based 3D Occupancy Prediction
Qihang Ma, Xin Tan, Yanyun Qu, Lizhuang Ma, Zhizhong Zhang, Yuan Xie; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 19936-19945
The autonomous driving community has shown significant interest in 3D occupancy prediction driven by its exceptional geometric perception and general object rec

ognition capabilities. To achieve this current works try to construct a Tri-Pers pective View (TPV) or Occupancy (OCC) representation extending from the Bird-Eye -View perception. However compressed views like TPV representation lose 3D geome try information while raw and sparse OCC representation requires heavy but redun dant computational costs. To address the above limitations we propose Compact Oc cupancy TRansformer (COTR) with a geometry-aware occupancy encoder and a semanti c-aware group decoder to reconstruct a compact 3D OCC representation. The occupa ncy encoder first generates a compact geometrical OCC feature through efficient explicit-implicit view transformation. Then the occupancy decoder further enhanc es the semantic discriminability of the compact OCC representation by a coarse-t o-fine semantic grouping strategy. Empirical experiments show that there are evi dent performance gains across multiple baselines e.g. COTR outperforms baselines with a relative improvement of 8%-15% demonstrating the superiority of our meth od.

Accelerating Diffusion Sampling with Optimized Time Steps
Shuchen Xue, Zhaoqiang Liu, Fei Chen, Shifeng Zhang, Tianyang Hu, Enze Xie, Zhen guo Li; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Re cognition (CVPR), 2024, pp. 8292-8301
Diffusion probabilistic models (DPMs) have shown remarkable performance in high-resolution image synthesis but their sampling efficiency is still to be desired due to the typically large number of sampling steps. Recent advancements in high -order numerical ODE solvers for DPMs have enabled the generation of high-qualit y images with much fewer sampling steps. While this is a significant development most sampling methods still employ uniform time steps which is not optimal when using a small number of steps. To address this issue we propose a general frame work for designing an optimization problem that seeks more appropriate time step s for a specific numerical ODE solver for DPMs. This optimization problem aims t o minimize the distance between the ground-truth solution to the ODE and an appr oximate solution corresponding to the numerical solver. It can be efficiently so lved using the constrained trust region method taking less than 15 seconds. Our extensive experiments on both unconditional and conditional sampling using pixel - and latent-space DPMs demonstrate that when combined with the state-of-the-art sampling method UniPC our optimized time steps significantly improve image gene ration performance in terms of FID scores for datasets such as CIFAR-10 and Imag eNet compared to using uniform time steps.

See Say and Segment: Teaching LMMs to Overcome False Premises
Tsung-Han Wu, Giscard Biamby, David Chan, Lisa Dunlap, Ritwik Gupta, Xudong Wang , Joseph E. Gonzalez, Trevor Darrell; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 13459-13469
Current open-source Large Multimodal Models (LMMs) excel at tasks such as open-v ocabulary language grounding and segmentation but can suffer under false premise s when queries imply the existence of something that is not actually present in the image. We observe that existing methods that fine-tune an LMM to segment ima ges significantly degrade their ability to reliably determine ("see") if an obje ct is present and to interact naturally with humans ("say") a form of catastroph ic forgetting. In this work we propose a cascading and joint training approach f or LMMs to solve this task avoiding catastrophic forgetting of previous skills. Our resulting model can "see" by detecting whether objects are present in an ima ge "say" by telling the user if they are not proposing alternative queries or co rrecting semantic errors in the query and finally "segment" by outputting the ma sk of the desired objects if they exist. Additionally we introduce a novel False Premise Correction benchmark dataset an extension of existing RefCOCO(+/g) refe rring segmentation datasets (which we call FP-RefCOCO(+/g)). The results show th at our method not only detects false premises up to 55% better than existing app roaches but under false premise conditions produces relative cIOU improvements o f more than 31% over baselines and produces natural language feedback judged hel pful up to 67% of the time.

Is Ego Status All You Need for Open-Loop End-to-End Autonomous Driving?
Zhiqi Li, Zhiding Yu, Shiyi Lan, Jiahan Li, Jan Kautz, Tong Lu, Jose M. Alvarez; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 14864-14873
End-to-end autonomous driving recently emerged as a promising research direction to target autonomy from a full-stack perspective. Along this line many of the latest works follow an open-loop evaluation setting on nuScenes to study the planning behavior. In this paper we delve deeper into the problem by conducting thorough analyses and demystifying more devils in the details. We initially observed that the nuScenes dataset characterized by relatively simple driving scenarios leads to an under-utilization of perception information in end-to-end models incorporating ego status such as the ego vehicle's velocity. These models tend to rely predominantly on the ego vehicle's status for future path planning. Beyond the limitations of the dataset we also note that current metrics do not comprehensively assess the planning quality leading to potentially biased conclusions drawn from existing benchmarks. To address this issue we introduce a new metric to evaluate whether the predicted trajectories adhere to the road. We further propose a simple baseline able to achieve competitive results without relying on perception annotations. Given the current limitations on the benchmark and metrics we suggest the community reassess relevant prevailing research and be cautious about whether the continued pursuit of state-of-the-art would yield convincing and universal conclusions. Code and models are available at https://github.com/NVlabs/BEV-Planner.

Unsupervised Template-assisted Point Cloud Shape Correspondence Network
Jiacheng Deng, Jiahao Lu, Tianzhu Zhang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 5250-5259
Unsupervised point cloud shape correspondence aims to establish point-wise correspondences between source and target point clouds. Existing methods obtain correspondences directly by computing point-wise feature similarity between point clouds. However non-rigid objects possess strong deformability and unusual shapes making it a longstanding challenge to directly establish correspondences between point clouds with unconventional shapes. To address this challenge we propose an unsupervised Template-Assisted point cloud shape correspondence Network termed TANet including a template generation module and a template assistance module. The proposed TANet enjoys several merits. Firstly the template generation module establishes a set of learnable templates with explicit structures. Secondly we introduce a template assistance module that extensively leverages the generated templates to establish more accurate shape correspondences from multiple perspectives. Extensive experiments on four human and animal datasets demonstrate that TANet achieves favorable performance against state-of-the-art methods.

CGI-DM: Digital Copyright Authentication for Diffusion Models via Contrasting Gradient Inversion
Xiaoyu Wu, Yang Hua, Chumeng Liang, Jiaru Zhang, Hao Wang, Tao Song, Haibing Guan; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 10812-10821
Diffusion Models (DMs) have evolved into advanced image generation tools especially for few-shot generation where a pre-trained model is fine-tuned on a small set of images to capture a specific style or object. Despite their success concerns exist about potential copyright violations stemming from the use of unauthorized data in this process. In response we present Contrasting Gradient Inversion for Diffusion Models (CGI-DM) a novel method featuring vivid visual representations for digital copyright authentication. Our approach involves removing partial information of an image and recovering missing details by exploiting conceptual differences between the pre-trained and fine-tuned models. We formulate the differences as KL divergence between latent variables of the two models when given the same input image which can be maximized through Monte Carlo sampling and Projected Gradient Descent (PGD). The similarity between original and recovered images serves as a strong indicator of potential infringements. Extensive experimen

ts on the WikiArt and Dreambooth datasets demonstrate the high accuracy of CGI-DM in digital copyright authentication surpassing alternative validation techniques. Code implementation is available at https://github.com/Nicholas0228/Revelio.

Making Visual Sense of Oracle Bones for You and Me
Runqi Qiao, Lan Yang, Kaiyue Pang, Honggang Zhang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 12656-12665
Visual perception evolves over time. This is particularly the case of oracle bone scripts where visual glyphs seem intuitive to people from distant past prove difficult to be understood in contemporary eyes. While semantic correspondence of an oracle can be found via a dictionary lookup this proves to be not enough for public viewers to connect the dots i.e. why does this oracle mean that? Common solution relies on a laborious curation process to collect visual guide for each oracle (Fig.1) which hinges on the case-by-case effort and taste of curators. This paper delves into one natural follow-up question: can AI take over?Begin with a comprehensive human study we show participants could indeed make better sense of an oracle glyph subjected to a proper visual guide and its efficacy can be approximated via a novel metric termed TransOV (Transferable Oracle Visuals). We then define a new conditional visual generation task based on an oracle glyph and its semantic meaning and importantly approach it by circumventing any form of model training in the presence of fatal lack of oracle data. At its heart is to leverage foundation model like GPT-4V to reason about the visual cues hidden inside an oracle and take advantage of an existing text-to-image model for final visual guide generation. Extensive empirical evidence shows our AI-enabled visual guides achieve significantly comparable TransOV performance compared with those collected under manual efforts. Finally we demonstrate the versatility of our system under a more complex setting where it is required to work alongside an AI image denoiser to cope with raw oracle scan image inputs (cf. processed clean oracle glyphs). Code is available at https://github.com/RQ-Lab/OBS-Visual.

Finsler-Laplace-Beltrami Operators with Application to Shape Analysis
Simon Weber, Thomas Dagès, Maolin Gao, Daniel Cremers; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 3131-3140
The Laplace-Beltrami operator (LBO) emerges from studying manifolds equipped with a Riemannian metric. It is often called the swiss army knife of geometry processing as it allows to capture intrinsic shape information and gives rise to heat diffusion geodesic distances and a multitude of shape descriptors. It also plays a central role in geometric deep learning. In this work we explore Finsler manifolds as a generalization of Riemannian manifolds. We revisit the Finsler heat equation and derive a Finsler heat kernel and a Finsler-Laplace-Beltrami Operator (FLBO): a novel theoretically justified anisotropic Laplace-Beltrami operator (ALBO). In experimental evaluations we demonstrate that the proposed FLBO is a valuable alternative to the traditional Riemannian-based LBO and ALBOs for spatial filtering and shape correspondence estimation. We hope that the proposed Finsler heat kernel and the FLBO will inspire further exploration of Finsler geometry in the computer vision community.

Minimal Perspective Autocalibration
Andrea Porfiri Dal Cin, Timothy Duff, Luca Magri, Tomas Pajdla; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 5064-5073
We introduce a new family of minimal problems for reconstruction from multiple views. Our primary focus is a novel approach to autocalibration a long-standing problem in computer vision. Traditional approaches to this problem such as those based on Kruppa's equations or the modulus constraint rely explicitly on the knowledge of multiple fundamental matrices or a projective reconstruction. In contrast we consider a novel formulation involving constraints on image points the unknown depths of 3D points and a partially specified calibration matrix K. For 2

and 3 views we present a comprehensive taxonomy of minimal autocalibration probl
ems obtained by relaxing some of these constraints. These problems are organized
 into classes according to the number of views and any assumed prior knowledge o
f K. Within each class we determine problems with the fewest---or a relatively s
mall number of---solutions. From this zoo of problems we devise three practical
solvers. Experiments with synthetic and real data and interfacing our solvers wi
th COLMAP demonstrate that we achieve superior accuracy compared to state-of-the
-art calibration methods. The code is available at https://github.com/andreadalc
in/MinimalPerspectiveAutocalibration.

MOHO: Learning Single-view Hand-held Object Reconstruction with Multi-view Occlu
sion-Aware Supervision
Chenyangguang Zhang, Guanlong Jiao, Yan Di, Gu Wang, Ziqin Huang, Ruida Zhang, F
abian Manhardt, Bowen Fu, Federico Tombari, Xiangyang Ji; Proceedings of the IEE
E/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 99
92-10002
Previous works concerning single-view hand-held object reconstruction typically
rely on supervision from 3D ground-truth models which are hard to collect in rea
l world. In contrast readily accessible hand-object videos offer a promising tra
ining data source but they only give heavily occluded object observations. In th
is paper we present a novel synthetic-to-real framework to exploit Multi-view Oc
clusion-aware supervision from hand-object videos for Hand-held Object reconstru
ction (MOHO) from a single image tackling two predominant challenges in such set
ting: hand-induced occlusion and object's self-occlusion. First in the synthetic
 pre-training stage we render a large-scaled synthetic dataset SOMVideo with han
d-object images and multi-view occlusion-free supervisions adopted to address ha
nd-induced occlusion in both 2D and 3D spaces. Second in the real-world finetuni
ng stage MOHO leverages the amodal-mask-weighted geometric supervision to mitiga
te the unfaithful guidance caused by the hand-occluded supervising views in real
 world. Moreover domain-consistent occlusion-aware features are amalgamated in M
OHO to resist object's self-occlusion for inferring the complete object shape. E
xtensive experiments on HO3D and DexYCB datasets demonstrate 2D-supervised MOHO
gains superior results against 3D-supervised methods by a large margin.

BANF: Band-Limited Neural Fields for Levels of Detail Reconstruction
Akhmedkhan Shabanov, Shrisudhan Govindarajan, Cody Reading, Lily Goli, Daniel Re
bain, Kwang Moo Yi, Andrea Tagliasacchi; Proceedings of the IEEE/CVF Conference
on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 20571-20580
Largely due to their implicit nature neural fields lack a direct mechanism for f
iltering as Fourier analysis from discrete signal processing is not directly app
licable to these representations. Effective filtering of neural fields is critic
al to enable level-of-detail processing in downstream applications and support o
perations that involve sampling the field on regular grids (e.g. marching cubes)
. Existing methods that attempt to decompose neural fields in the frequency doma
in either resort to heuristics or require extensive modifications to the neural
field architecture. We show that via a simple modification one can obtain neural
 fields that are low-pass filtered and in turn show how this can be exploited to
 obtain a frequency decomposition of the entire signal. We demonstrate the valid
ity of our technique by investigating level-of-detail reconstruction and showing
 how coarser representations can be computed effectively.

Time- Memory- and Parameter-Efficient Visual Adaptation
Otniel-Bogdan Mercea, Alexey Gritsenko, Cordelia Schmid, Anurag Arnab; Proceedin
gs of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR),
 2024, pp. 5536-5545
As foundation models become more popular there is a growing need to efficiently
finetune them for downstream tasks. Although numerous adaptation methods have be
en proposed they are designed to be efficient only in terms of how many paramete
rs are trained. They however typically still require backpropagating gradients t
hroughout the model meaning that their training-time and -memory cost does not r

educe as significantly. We propose an adaptation method which does not backpropagate gradients through the backbone. We achieve this by designing a lightweight network in parallel that operates on features from the frozen pretrained backbone. As a result our method is efficient not only in terms of parameters but also in training-time and memory usage. Our approach achieves state-of-the-art accuracy-parameter trade-offs on the popular VTAB benchmark and we further show how we outperform prior works with respect to training-time and -memory usage too. We further demonstrate the training efficiency and scalability of our method by adapting a vision transformer backbone of 4 billion parameters for the computationally demanding task of video classification without any intricate model parallelism. Here we outperform a prior adaptor-based method which could only scale to a 1 billion parameter backbone or fully-finetuning a smaller backbone with the same GPU and less training time.

SecondPose: SE(3)-Consistent Dual-Stream Feature Fusion for Category-Level Pose Estimation
Yamei Chen, Yan Di, Guangyao Zhai, Fabian Manhardt, Chenyangguang Zhang, Ruida Zhang, Federico Tombari, Nassir Navab, Benjamin Busam; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 9959-9969
Category-level object pose estimation aiming to predict the 6D pose and 3D size of objects from known categories typically struggles with large intra-class shape variation. Existing works utilizing mean shapes often fall short of capturing this variation. To address this issue we present SecondPose a novel approach integrating object-specific geometric features with semantic category priors from DINOv2. Leveraging the advantage of DINOv2 in providing SE(3)-consistent semantic features we hierarchically extract two types of SE(3)-invariant geometric features to further encapsulate local-to-global object-specific information. These geometric features are then point-aligned with DINOv2 features to establish a consistent object representation under SE(3) transformations facilitating the mapping from camera space to the pre-defined canonical space thus further enhancing pose estimation. Extensive experiments on NOCS-REAL275 demonstrate that SecondPose achieves a 12.4% leap forward over the state-of-the-art. Moreover on a more complex dataset HouseCat6D which provides photometrically challenging objects SecondPose still surpasses other competitors by a large margin. Code is released at https://github.com/NOrangeeroli/SecondPose.git.

Physical Property Understanding from Language-Embedded Feature Fields
Albert J. Zhai, Yuan Shen, Emily Y. Chen, Gloria X. Wang, Xinlei Wang, Sheng Wang, Kaiyu Guan, Shenlong Wang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 28296-28305
Can computers perceive the physical properties of objects solely through vision? Research in cognitive science and vision science has shown that humans excel at identifying materials and estimating their physical properties based purely on visual appearance. In this paper we present a novel approach for dense prediction of the physical properties of objects using a collection of images. Inspired by how humans reason about physics through vision we leverage large language models to propose candidate materials for each object. We then construct a language-embedded point cloud and estimate the physical properties of each 3D point using a zero-shot kernel regression approach. Our method is accurate annotation-free and applicable to any object in the open world. Experiments demonstrate the effectiveness of the proposed approach in various physical property reasoning tasks such as estimating the mass of common objects as well as other properties like friction and hardness.

EgoGen: An Egocentric Synthetic Data Generator
Gen Li, Kaifeng Zhao, Siwei Zhang, Xiaozhong Lyu, Mihai Dusmanu, Yan Zhang, Marc Pollefeys, Siyu Tang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 14497-14509
Understanding the world in first-person view is fundamental in Augmented Reality

(AR). This immersive perspective brings dramatic visual changes and unique chal
lenges compared to third-person views. Synthetic data has empowered third-person
-view vision models but its application to embodied egocentric perception tasks
remains largely unexplored. A critical challenge lies in simulating natural huma
n movements and behaviors that effectively steer the embodied cameras to capture
 a faithful egocentric representation of the 3D world. To address this challenge
 we introduce EgoGen a new synthetic data generator that can produce accurate an
d rich ground-truth training data for egocentric perception tasks. At the heart
of EgoGen is a novel human motion synthesis model that directly leverages egocen
tric visual inputs of a virtual human to sense the 3D environment. Combined with
 collision-avoiding motion primitives and a two-stage reinforcement learning app
roach our motion synthesis model offers a closed-loop solution where the embodie
d perception and movement of the virtual human are seamlessly coupled. Compared
to previous works our model eliminates the need for a pre-defined global path an
d is directly applicable to dynamic environments. Combined with our easy-to-use
and scalable data generation pipeline we demonstrate EgoGen's efficacy in three
tasks: mapping and localization for head-mounted cameras egocentric camera track
ing and human mesh recovery from egocentric views. EgoGen will be fully open-sou
rced offering a practical solution for creating realistic egocentric training da
ta and aiming to serve as a useful tool for egocentric computer vision research.

Suppress and Rebalance: Towards Generalized Multi-Modal Face Anti-Spoofing
Xun Lin, Shuai Wang, Rizhao Cai, Yizhong Liu, Ying Fu, Wenzhong Tang, Zitong Yu,
 Alex Kot; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern
 Recognition (CVPR), 2024, pp. 211-221
Face Anti-Spoofing (FAS) is crucial for securing face recognition systems agains
t presentation attacks. With advancements in sensor manufacture and multi-modal
learning techniques many multi-modal FAS approaches have emerged. However they f
ace challenges in generalizing to unseen attacks and deployment conditions. Thes
e challenges arise from (1) modality unreliability where some modality sensors l
ike depth and infrared undergo significant domain shifts in varying environments
 leading to the spread of unreliable information during cross-modal feature fusi
on and (2) modality imbalance where training overly relies on a dominant modalit
y hinders the convergence of others reducing effectiveness against attack types
that are indistinguishable by sorely using the dominant modality. To address mod
ality unreliability we propose the Uncertainty-Guided Cross-Adapter (U-Adapter)
to recognize unreliably detected regions within each modality and suppress the i
mpact of unreliable regions on other modalities. For modality imbalance we propo
se a Rebalanced Modality Gradient Modulation (ReGrad) strategy to rebalance the
convergence speed of all modalities by adaptively adjusting their gradients. Bes
ides we provide the first large-scale benchmark for evaluating multi-modal FAS p
erformance under domain generalization scenarios. Extensive experiments demonstr
ate that our method outperforms state-of-the-art methods. Source codes and proto
cols are released on https://github.com/OMGGGGG/mmdg.

LEAD: Exploring Logit Space Evolution for Model Selection
Zixuan Hu, Xiaotong Li, Shixiang Tang, Jun Liu, Yichun Hu, Ling-Yu Duan; Proceed
ings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR
), 2024, pp. 28664-28673
The remarkable success of "pretrain-then-finetune" paradigm has led to a prolife
ration of available pre-trained models for vision tasks. This surge presents a s
ignificant challenge in efficiently choosing the most suitable pre-trained model
s for downstream tasks. The critical aspect of this challenge lies in effectivel
y predicting the model transferability by considering the underlying fine-tuning
 dynamics. Existing methods often model fine-tuning dynamics in feature space wi
th linear transformations which do not precisely align with the fine-tuning obje
ctive and fail to grasp the essential nonlinearity from optimization. To this en
d we present LEAD a finetuning-aligned approach based on the network output of l
ogits. LEAD proposes a theoretical framework to model the optimization process a
nd derives an ordinary differential equation (ODE) to depict the nonlinear evolu

tion toward the final logit state. Additionally we design a class-aware decompos
ition method to consider the varying evolution dynamics across classes and furth
er ensure practical applicability. Integrating the closely aligned optimization
objective and nonlinear modeling capabilities derived from the differential equa
tion our method offers a concise solution to effectively bridge the optimization
 gap in a single step bypassing the lengthy fine-tuning process. The comprehensi
ve experiments on 24 supervised and self-supervised pre-trained models across 10
 downstream datasets demonstrate impressive performances and showcase its broad
adaptability even in low-data scenarios.
****
Video ReCap: Recursive Captioning of Hour-Long Videos
Md Mohaiminul Islam, Ngan Ho, Xitong Yang, Tushar Nagarajan, Lorenzo Torresani,
Gedas Bertasius; Proceedings of the IEEE/CVF Conference on Computer Vision and P
attern Recognition (CVPR), 2024, pp. 18198-18208
Most video captioning models are designed to process short video clips of few se
conds and output text describing low-level visual concepts (e.g. objects scenes
atomic actions). However most real-world videos last for minutes or hours and ha
ve a complex hierarchical structure spanning different temporal granularities. W
e propose Video ReCap a recursive video captioning model that can process video
inputs of dramatically different lengths (from 1 second to 2 hours) and output v
ideo captions at multiple hierarchy levels. The recursive video-language archite
cture exploits the synergy between different video hierarchies and can process h
our-long videos efficiently. We utilize a curriculum learning training scheme to
 learn the hierarchical structure of videos starting from clip-level captions de
scribing atomic actions then focusing on segment-level descriptions and concludi
ng with generating summaries for hour-long videos. Furthermore we introduce Ego4
D-HCap dataset by augmenting Ego4D with 8267 manually collected long-range video
 summaries. Our recursive model can flexibly generate captions at different hier
archy levels while also being useful for other complex video understanding tasks
 such as VideoQA on EgoSchema. Data code and models are publicly available at ht
tps://sites.google.com/view/vidrecap.

Towards Realistic Scene Generation with LiDAR Diffusion Models
Haoxi Ran, Vitor Guizilini, Yue Wang; Proceedings of the IEEE/CVF Conference on
Computer Vision and Pattern Recognition (CVPR), 2024, pp. 14738-14748
Diffusion models (DMs) excel in photo-realistic image synthesis but their adapta
tion to LiDAR scene generation poses a substantial hurdle. This is primarily bec
ause DMs operating in the point space struggle to preserve the curve-like patter
ns and 3D geometry of LiDAR scenes which consumes much of their representation p
ower. In this paper we propose LiDAR Diffusion Models (LiDMs) to generate LiDAR-
realistic scenes from a latent space tailored to capture the realism of LiDAR sc
enes by incorporating geometric priors into the learning pipeline. Our method ta
rgets three major desiderata: pattern realism geometry realism and object realis
m. Specifically we introduce curve-wise compression to simulate real-world LiDAR
 patterns point-wise coordinate supervision to learn scene geometry and patch-wi
se encoding for a full 3D object context. With these three core designs our meth
od achieves competitive performance on unconditional LiDAR generation in 64-beam
 scenario and state of the art on conditional LiDAR generation while maintaining
 high efficiency compared to point-based DMs (up to 107xfaster). Furthermore by
compressing LiDAR scenes into a latent space we enable the controllability of DM
s with various conditions such as semantic maps camera views and text prompts. O
ur code and pretrained weights are available at https://github.com/hancyran/LiDA

Diffusion Reflectance Map: Single-Image Stochastic Inverse Rendering of Illumina
tion and Reflectance
Yuto Enyo, Ko Nishino; Proceedings of the IEEE/CVF Conference on Computer Vision
 and Pattern Recognition (CVPR), 2024, pp. 11873-11883
Reflectance bounds the frequency spectrum of illumination in the object appearan
ce. In this paper we introduce the first stochastic inverse rendering method whi

ch recovers the attenuated frequency spectrum of an illumination jointly with the reflectance of an object of known geometry from a single image. Our key idea is to solve this blind inverse problem in the reflectance map an appearance representation invariant to the underlying geometry by learning to reverse the image formation with a novel diffusion model which we refer to as the Diffusion Reflectance Map Network (DRMNet). Given an observed reflectance map converted and completed from the single input image DRMNet generates a reflectance map corresponding to a perfect mirror sphere while jointly estimating the reflectance. The forward process can be understood as gradually filtering a natural illumination with lower and lower frequency reflectance and additive Gaussian noise. DRMNet learns to invert this process with two subnetworks IllNet and RefNet which work in concert towards this joint estimation. The network is trained on an extensive synthetic dataset and is demonstrated to generalize to real images showing state-of-the-art accuracy on established datasets.

Universal Segmentation at Arbitrary Granularity with Language Instruction
Yong Liu, Cairong Zhang, Yitong Wang, Jiahao Wang, Yujiu Yang, Yansong Tang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 3459-3469
This paper aims to achieve universal segmentation of arbitrary semantic level. Despite significant progress in recent years specialist segmentation approaches are limited to specific tasks and data distribution. Retraining a new model for adaptation to new scenarios or settings takes expensive computation and time cost which raises the demand for versatile and universal segmentation model that can cater to various granularity. Although some attempts have been made for unifying different segmentation tasks or generalization to various scenarios limitations in the definition of paradigms and input-output spaces make it difficult for them to achieve accurate understanding of content at arbitrary granularity. To this end we present UniLSeg a universal segmentation model that can perform segmentation at any semantic level with the guidance of language instructions. For training UniLSeg we reorganize a group of tasks from original diverse distributions into a unified data format where images with texts describing segmentation targets as input and corresponding masks are output. Combined with a automatic annotation engine for utilizing numerous unlabeled data UniLSeg achieves excellent performance on various tasks and settings surpassing both specialist and unified segmentation models.

GaussianAvatars: Photorealistic Head Avatars with Rigged 3D Gaussians
Shenhan Qian, Tobias Kirschstein, Liam Schoneveld, Davide Davoli, Simon Giebenhain, Matthias Nießner; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 20299-20309
We introduce GaussianAvatars a new method to create photorealistic head avatars that are fully controllable in terms of expression pose and viewpoint. The core idea is a dynamic 3D representation based on 3D Gaussian splats that are rigged to a parametric morphable face model. This combination facilitates photorealistic rendering while allowing for precise animation control via the underlying parametric model e.g. through expression transfer from a driving sequence or by manually changing the morphable model parameters. We parameterize each splat by a local coordinate frame of a triangle and optimize for explicit displacement offset to obtain a more accurate geometric representation. During avatar reconstruction we jointly optimize for the morphable model parameters and Gaussian splat parameters in an end-to-end fashion. We demonstrate the animation capabilities of our photorealistic avatar in several challenging scenarios. For instance we show reenactments from a driving video where our method outperforms existing works by a significant margin.

MMMU: A Massive Multi-discipline Multimodal Understanding and Reasoning Benchmark for Expert AGI
Xiang Yue, Yuansheng Ni, Kai Zhang, Tianyu Zheng, Ruoqi Liu, Ge Zhang, Samuel Stevens, Dongfu Jiang, Weiming Ren, Yuxuan Sun, Cong Wei, Botao Yu, Ruibin Yuan, R

enliang Sun, Ming Yin, Boyuan Zheng, Zhenzhu Yang, Yibo Liu, Wenhao Huang, Huan Sun, Yu Su, Wenhu Chen; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 9556-9567
We introduce MMMU: a new benchmark designed to evaluate multimodal models on massive multi-discipline tasks demanding college-level subject knowledge and deliberate reasoning. MMMU includes 11.5K meticulously collected multimodal questions from college exams quizzes and textbooks covering six core disciplines: Art & Design Business Science Health & Medicine Humanities & Social Science and Tech & Engineering. These questions span 30 subjects and 183 subfields comprising 30 highly heterogeneous image types such as charts diagrams maps tables music sheets and chemical structures. Unlike existing benchmarks MMMU focuses on advanced perception and reasoning with domain-specific knowledge challenging models to perform tasks akin to those faced by experts. The evaluation of 28 open-source LMMs as well as the proprietary GPT-4V(ision) and Gemini highlights the substantial challenges posed by MMMU. Even the advanced GPT-4V and Gemini Ultra only achieve accuracies of 56% and 59% respectively indicating significant room for improvement. We believe MMMU will stimulate the community to build next-generation multimodal foundation models towards expert artificial general intelligence.

Layout-Agnostic Scene Text Image Synthesis with Diffusion Models
Qilong Zhangli, Jindong Jiang, Di Liu, Licheng Yu, Xiaoliang Dai, Ankit Ramchandani, Guan Pang, Dimitris N. Metaxas, Praveen Krishnan; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 7496-7506
While diffusion models have significantly advanced the quality of image generation their capability to accurately and coherently render text within these images remains a substantial challenge. Conventional diffusion-based methods for scene text generation are typically limited by their reliance on an intermediate layout output. This dependency often results in a constrained diversity of text styles and fonts an inherent limitation stemming from the deterministic nature of the layout generation phase. To address these challenges this paper introduces SceneTextGen a novel diffusion-based model specifically designed to circumvent the need for a predefined layout stage. By doing so SceneTextGen facilitates a more natural and varied representation of text. The novelty of SceneTextGen lies in its integration of three key components: a character-level encoder for capturing detailed typographic properties coupled with a character-level instance segmentation model and a word-level spotting model to address the issues of unwanted text generation and minor character inaccuracies. We validate the performance of our method by demonstrating improved character recognition rates on generated images across different public visual text datasets in comparison to both standard diffusion based methods and text specific methods.

EarthLoc: Astronaut Photography Localization by Indexing Earth from Space
Gabriele Berton, Alex Stoken, Barbara Caputo, Carlo Masone; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 12754-12764
Astronaut photography spanning six decades of human spaceflight presents a unique Earth observations dataset with immense value for both scientific research and disaster response. Despite its significance accurately localizing the geographical extent of these images crucial for effective utilization poses substantial challenges. Current manual localization efforts are time-consuming motivating the need for automated solutions. We propose a novel approach - leveraging image retrieval - to address this challenge efficiently. We introduce innovative training techniques including Year-Wise Data Augmentation and a Neutral-Aware Multi-Similarity Loss which contribute to the development of a high-performance model EarthLoc. We develop six evaluation datasets and perform a comprehensive benchmark comparing EarthLoc to existing methods showcasing its superior efficiency and accuracy. Our approach marks a significant advancement in automating the localization of astronaut photography which will help bridge a critical gap in Earth observations data. Code and datasets are available at this https://github.com/gmbert

SmartMask: Context Aware High-Fidelity Mask Generation for Fine-grained Object I
nsertion and Layout Control
Jaskirat Singh, Jianming Zhang, Qing Liu, Cameron Smith, Zhe Lin, Liang Zheng; P
roceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition
 (CVPR), 2024, pp. 6497-6506
The field of generative image inpainting and object insertion has made significa
nt progress with the recent advent of latent diffusion models. Utilizing a preci
se object mask can greatly enhance these applications. However due to the challe
nges users encounter in creating high-fidelity masks there is a tendency for the
se methods to rely on more coarse masks (e.g. bounding box) for these applicatio
ns. This results in limited control and compromised background content preservat
ion. To overcome these limitations we introduce SmartMask which allows any novic
e user to create detailed masks for precise object insertion. Combined with a Co
ntrolNet-Inpaint model our experiments demonstrate that SmartMask achieves super
ior object insertion quality preserving the background content more effectively
than previous methods. Notably unlike prior works the proposed approach can also
 be used even without user-mask guidance which allows it to perform mask-free ob
ject insertion at diverse positions and scales. Furthermore we find that when us
ed iteratively with a novel instruction-tuning based planning model SmartMask ca
n be used to design detailed layouts from scratch. As compared with user-scribbl
e based layout design we observe that SmartMask allows for better quality output
s with layout-to-image generation methods.

Text-Image Alignment for Diffusion-Based Perception
Neehar Kondapaneni, Markus Marks, Manuel Knott, Rogerio Guimaraes, Pietro Perona
; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognit
ion (CVPR), 2024, pp. 13883-13893
Diffusion models are generative models with impressive text-to-image synthesis c
apabilities and have spurred a new wave of creative methods for classical machin
e learning tasks. However the best way to harness the perceptual knowledge of th
ese generative models for visual tasks is still an open question. Specifically i
t is unclear how to use the prompting interface when applying diffusion backbone
s to vision tasks. We find that automatically generated captions can improve tex
t-image alignment and significantly enhance a model's cross-attention maps leadi
ng to better perceptual performance. Our approach improves upon the current stat
e-of-the-art in diffusion-based semantic segmentation on ADE20K and the current
overall SOTA for depth estimation on NYUv2. Furthermore our method generalizes t
o the cross-domain setting. We use model personalization and caption modificatio
ns to align our model to the target domain and find improvements over unaligned
baselines. Our cross-domain object detection model trained on Pascal VOC achieve
s SOTA results on Watercolor2K. Our cross-domain segmentation method trained on
Cityscapes achieves SOTA results on Dark Zurich-val and Nighttime Driving. Proje
ct page: vision.caltech.edu/TADP/. Code: github.com/damaggu/TADP

Customization Assistant for Text-to-Image Generation
Yufan Zhou, Ruiyi Zhang, Jiuxiang Gu, Tong Sun; Proceedings of the IEEE/CVF Conf
erence on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 9182-9191
Customizing pre-trained text-to-image generation model has attracted massive res
earch interest recently due to its huge potential in real-world applications. Al
though existing methods are able to generate creative content for a novel concep
t contained in single user-input image their capability are still far from perfe
ction. Specifically most existing methods require fine-tuning the generative mod
el on testing images. Some existing methods do not require fine-tuning while the
ir performance are unsatisfactory. Furthermore the interaction between users and
 models are still limited to directive and descriptive prompts such as instructi
ons and captions. In this work we build a customization assistant based on pre-t
rained large language model and diffusion model which can not only perform custo
mized generation in a tuning-free manner but also enable more user-friendly inte

ractions: users can chat with the assistant and input either ambiguous text or clear instruction. Specifically we propose a new framework consists of a new model design and a novel training strategy. The resulting assistant can perform customized generation in 2-5 seconds without any test time fine-tuning. Extensive experiments are conducted competitive results have been obtained across different domains illustrating the effectiveness of the proposed method.
****
GaussianEditor: Editing 3D Gaussians Delicately with Text Instructions
Junjie Wang, Jiemin Fang, Xiaopeng Zhang, Lingxi Xie, Qi Tian; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 20902-20911
Recently impressive results have been achieved in 3D scene editing with text instructions based on a 2D diffusion model. However current diffusion models primarily generate images by predicting noise in the latent space and the editing is usually applied to the whole image which makes it challenging to perform delicate especially localized editing for 3D scenes. Inspired by recent 3D Gaussian splatting we propose a systematic framework named GaussianEditor to edit 3D scenes delicately via 3D Gaussians with text instructions. Benefiting from the explicit property of 3D Gaussians we design a series of techniques to achieve delicate editing. Specifically we first extract the region of interest (RoI) corresponding to the text instruction aligning it to 3D Gaussians. The Gaussian RoI is further used to control the editing process. Our framework can achieve more delicate and precise editing of 3D scenes than previous methods while enjoying much faster training speed i.e. within 20 minutes on a single V100 GPU more than twice as fast as Instruct-NeRF2NeRF (45 minutes -- 2 hours). The project page is at GaussianEditor.github.io.
****
MemFlow: Optical Flow Estimation and Prediction with Memory
Qiaole Dong, Yanwei Fu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 19068-19078
Optical flow is a classical task that is important to the vision community. Classical optical flow estimation uses two frames as input whilst some recent methods consider multiple frames to explicitly model long-range information. The former ones limit their ability to fully leverage temporal coherence along the video sequence; and the latter ones incur heavy computational overhead typically not possible for real-time flow estimation. Some multi-frame-based approaches even necessitate unseen future frames for current estimation compromising real-time applicability in safety-critical scenarios. To this end we present MemFlow a real-time method for optical flow estimation and prediction with memory. Our method enables memory read-out and update modules for aggregating historical motion information in real-time. Furthermore we integrate resolution-adaptive re-scaling to accommodate diverse video resolutions. Besides our approach seamlessly extends to the future prediction of optical flow based on past observations. Leveraging effective historical motion aggregation our method outperforms VideoFlow with fewer parameters and faster inference speed on Sintel and KITTI-15 datasets in terms of generalization performance. At the time of submission MemFlow also leads in performance on the 1080p Spring dataset. Codes and models will be available at: https://dqiaole.github.io/MemFlow/.

Novel Class Discovery for Ultra-Fine-Grained Visual Categorization
Yu Liu, Yaqi Cai, Qi Jia, Binglin Qiu, Weimin Wang, Nan Pu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 17679-17688
Ultra-fine-grained visual categorization (Ultra-FGVC) aims at distinguishing highly similar sub-categories within fine-grained objects such as different soybean cultivars. Compared to traditional fine-grained visual categorization Ultra-FGVC encounters more hurdles due to the small inter-class and large intra-class variation. Given these challenges relying on human annotation for Ultra-FGVC is impractical. To this end our work introduces a novel task termed Ultra-Fine-Grained Novel Class Discovery (UFG-NCD) which leverages partially annotated data to ide

ntify new categories of unlabeled images for Ultra-FGVC. To tackle this problem we devise a Region-Aligned Proxy Learning (RAPL) framework which comprises a Channel-wise Region Alignment (CRA) module and a Semi-Supervised Proxy Learning (SemiPL) strategy. The CRA module is designed to extract and utilize discriminative features from local regions facilitating knowledge transfer from labeled to unlabeled classes. Furthermore SemiPL strengthens representation learning and knowledge transfer with proxy-guided supervised learning and proxy-guided contrastive learning. Such techniques leverage class distribution information in the embedding space improving the mining of subtle differences between labeled and unlabeled ultra-fine-grained classes. Extensive experiments demonstrate that RAPL significantly outperforms baselines across various datasets indicating its effectiveness in handling the challenges of UFG-NCD. Code is available at https://github.com/SSDUT-Caiyq/UFG-NCD.

GenHowTo: Learning to Generate Actions and State Transformations from Instructional Videos
Tomáš Sou?ek, Dima Damen, Michael Wray, Ivan Laptev, Josef Sivic; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 6561-6571
We address the task of generating temporally consistent and physically plausible images of actions and object state transformations. Given an input image and a text prompt describing the targeted transformation our generated images preserve the environment and transform objects in the initial image. Our contributions are threefold. First we leverage a large body of instructional videos and automatically mine a dataset of triplets of consecutive frames corresponding to initial object states actions and resulting object transformations. Second equipped with this data we develop and train a conditioned diffusion model dubbed GenHowTo. Third we evaluate GenHowTo on a variety of objects and actions and show superior performance compared to existing methods. In particular we introduce a quantitative evaluation where GenHowTo achieves 88% and 74% on seen and unseen interaction categories respectively outperforming prior work by a large margin.
****
Paint-it: Text-to-Texture Synthesis via Deep Convolutional Texture Map Optimization and Physically-Based Rendering
Kim Youwang, Tae-Hyun Oh, Gerard Pons-Moll; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 4347-4356
We present Paint-it a text-driven high-fidelity texture map synthesis method for 3D meshes via neural re-parameterized texture optimization. Paint-it synthesizes texture maps from a text description by synthesis-through-optimization exploiting the Score-Distillation Sampling (SDS). We observe that directly applying SDS yields undesirable texture quality due to its noisy gradients. We reveal the importance of texture parameterization when using SDS. Specifically we propose Deep Convolutional Physically-Based Rendering (DC-PBR) parameterization which re-parameterizes the physically-based rendering (PBR) texture maps with randomly initialized convolution-based neural kernels instead of a standard pixel-based parameterization. We show that DC-PBR inherently schedules the optimization curriculum according to texture frequency and naturally filters out the noisy signals from SDS. In experiments Paint-it obtains remarkable quality PBR texture maps within 15 min. given only a text description. We demonstrate the generalizability and practicality of Paint-it by synthesizing high-quality texture maps for large-scale mesh datasets and showing test-time applications such as relighting and material control using a popular graphics engine.

HiKER-SGG: Hierarchical Knowledge Enhanced Robust Scene Graph Generation
Ce Zhang, Simon Stepputtis, Joseph Campbell, Katia Sycara, Yaqi Xie; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 28233-28243
Being able to understand visual scenes is a precursor for many downstream tasks including autonomous driving robotics and other vision-based approaches. A common approach enabling the ability to reason over visual data is Scene Graph Genera

tion (SGG); however many existing approaches assume undisturbed vision i.e. the absence of real-world corruptions such as fog snow smoke as well as non-uniform perturbations like sun glare or water drops. In this work we propose a novel SGG benchmark containing procedurally generated weather corruptions and other transformations over the Visual Genome dataset. Further we introduce a corresponding approach Hierarchical Knowledge Enhanced Robust Scene Graph Generation (HiKER-SGG) providing a strong baseline for scene graph generation under such challenging setting. At its core HiKER-SGG utilizes a hierarchical knowledge graph in order to refine its predictions from coarse initial estimates to detailed predictions. In our extensive experiments we show that HiKER-SGG does not only demonstrate superior performance on corrupted images in a zero-shot manner but also outperforms current state-of-the-art methods on uncorrupted SGG tasks. Code is available at https://github.com/zhangce01/HiKER-SGG.

DiffusionGAN3D: Boosting Text-guided 3D Generation and Domain Adaptation by Combining 3D GANs and Diffusion Priors
Biwen Lei, Kai Yu, Mengyang Feng, Miaomiao Cui, Xuansong Xie; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 10487-10497
Text-guided domain adaptation and generation of 3D-aware portraits find many applications in various fields. However due to the lack of training data and the challenges in handling the high variety of geometry and appearance the existing methods for these tasks suffer from issues like inflexibility instability and low fidelity. In this paper we propose a novel framework DiffusionGAN3D which boosts text-guided 3D domain adaptation and generation by combining 3D GANs and diffusion priors. Specifically we integrate the pre-trained 3D generative models (e.g. EG3D) and text-to-image diffusion models. The former provides a strong foundation for stable and high-quality avatar generation from text. And the diffusion models in turn offer powerful priors and guide the 3D generator finetuning with informative direction to achieve flexible and efficient text-guided domain adaptation. To enhance the diversity in domain adaptation and the generation capability in text-to-avatar we introduce the relative distance loss and case-specific learnable triplane respectively. Besides we design a progressive texture refinement module to improve the texture quality for both tasks above. Extensive experiments demonstrate that the proposed framework achieves excellent results in both domain adaptation and text-to-avatar tasks outperforming existing methods in terms of generation quality and efficiency. The project homepage is at https://younglbw.github.io/DiffusionGAN3D-homepage/.

Physics-Aware Hand-Object Interaction Denoising
Haowen Luo, Yunze Liu, Li Yi; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 2341-2350
The credibility and practicality of a reconstructed hand-object interaction sequence depend largely on its physical plausibility. However due to high occlusions during hand-object interaction physical plausibility remains a challenging criterion for purely vision-based tracking methods. To address this issue and enhance the results of existing hand trackers this paper proposes a novel physically-aware hand motion de-noising method. Specifically we introduce two learned loss terms that explicitly capture two crucial aspects of physical plausibility: grasp credibility and manipulation feasibility. These terms are used to train a physically-aware de-noising network. Qualitative and quantitative experiments demonstrate that our approach significantly improves both fine-grained physical plausibility and overall pose accuracy surpassing current state-of-the-art de-noising methods.

VastGaussian: Vast 3D Gaussians for Large Scene Reconstruction
Jiaqi Lin, Zhihao Li, Xiao Tang, Jianzhuang Liu, Shiyong Liu, Jiayue Liu, Yangdi Lu, Xiaofei Wu, Songcen Xu, Youliang Yan, Wenming Yang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 5166-5175

Existing NeRF-based methods for large scene reconstruction often have limitation
s in visual quality and rendering speed. While the recent 3D Gaussian Splatting
works well on small-scale and object-centric scenes scaling it up to large scene
s poses challenges due to limited video memory long optimization time and notice
able appearance variations. To address these challenges we present VastGaussian
the first method for high-quality reconstruction and real-time rendering on larg
e scenes based on 3D Gaussian Splatting. We propose a progressive partitioning s
trategy to divide a large scene into multiple cells where the training cameras a
nd point cloud are properly distributed with an airspace-aware visibility criter
ion. These cells are merged into a complete scene after parallel optimization. W
e also introduce decoupled appearance modeling into the optimization process to
reduce appearance variations in the rendered images. Our approach outperforms ex
isting NeRF-based methods and achieves state-of-the-art results on multiple larg
e scene datasets enabling fast optimization and high-fidelity real-time renderin
g.

Edit One for All: Interactive Batch Image Editing
Thao Nguyen, Utkarsh Ojha, Yuheng Li, Haotian Liu, Yong Jae Lee; Proceedings of
the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024,
pp. 8271-8280
In recent years image editing has advanced remarkably. With increased human cont
rol it is now possible to edit an image in a plethora of ways; from specifying i
n text what we want to change to straight up dragging the contents of the image
in an interactive point-based manner. However most of the focus has remained on
editing single images at a time. Whether and how we can simultaneously edit larg
e batches of images has remained understudied. With the goal of minimizing human
supervision in the editing process this paper presents a novel method for inter
active batch image editing using StyleGAN as the medium. Given an edit specified
by users in an example image (e.g. make the face frontal) our method can automa
tically transfer that edit to other test images so that regardless of their init
ial state (pose) they all arrive at the same final state (e.g. all facing front)
. Extensive experiments demonstrate that edits performed using our method have s
imilar visual quality to existing single-image-editing methods while having more
visual consistency and saving significant time and human effort.

Rethinking Boundary Discontinuity Problem for Oriented Object Detection
Hang Xu, Xinyuan Liu, Haonan Xu, Yike Ma, Zunjie Zhu, Chenggang Yan, Feng Dai; P
roceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition
(CVPR), 2024, pp. 17406-17415
Oriented object detection has been developed rapidly in the past few years where
rotation equivariance is crucial for detectors to predict rotated boxes. It is
expected that the prediction can maintain the corresponding rotation when object
s rotate but severe mutation in angular prediction is sometimes observed when ob
jects rotate near the boundary angle which is well-known boundary discontinuity
problem. The problem has been long believed to be caused by the sharp loss incre
ase at the angular boundary and widely used joint-optim IoU-like methods deal wi
th this problem by loss-smoothing. However we experimentally find that even stat
e-of-the-art IoU-like methods actually fail to solve the problem. On further ana
lysis we find that the key to solution lies in encoding mode of the smoothing fu
nction rather than in joint or independent optimization. In existing IoU-like me
thods the model essentially attempts to fit the angular relationship between box
and object where the break point at angular boundary makes the predictions high
ly unstable. To deal with this issue we propose a dual-optimization paradigm for
angles. We decouple reversibility and joint-optim from single smoothing functio
n into two distinct entities which for the first time achieves the objectives of
both correcting angular boundary and blending angle with other parameters. Exte
nsive experiments on multiple datasets show that boundary discontinuity problem
is well-addressed. Moreover typical IoU-like methods are improved to the same le
vel without obvious performance gap. The code is available at https://github.com
/hangxu-cv/cvpr24acm.

Deformable One-shot Face Stylization via DINO Semantic Guidance
Yang Zhou, Zichong Chen, Hui Huang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 7787-7796
This paper addresses the complex issue of one-shot face stylization focusing on the simultaneous consideration of appearance and structure where previous methods have fallen short. We explore deformation-aware face stylization that diverges from traditional single-image style reference opting for a real-style image pair instead. The cornerstone of our method is the utilization of a self-supervised vision transformer specifically DINO-ViT to establish a robust and consistent facial structure representation across both real and style domains. Our stylization process begins by adapting the StyleGAN generator to be deformation-aware through the integration of spatial transformers (STN). We then introduce two innovative constraints for generator fine-tuning under the guidance of DINO semantics: i) a directional deformation loss that regulates directional vectors in DINO space and ii) a relative structural consistency constraint based on DINO token self-similarities ensuring diverse generation. Additionally style-mixing is employed to align the color generation with the reference minimizing inconsistent correspondences. This framework delivers enhanced deformability for general one-shot face stylization achieving notable efficiency with a fine-tuning duration of approximately 10 minutes. Extensive qualitative and quantitative comparisons demonstrate our superiority over state-of-the-art one-shot face stylization methods. Code is available at https://github.com/zichongc/DoesFS

SleepVST: Sleep Staging from Near-Infrared Video Signals using Pre-Trained Transformers
Jonathan F. Carter, João Jorge, Oliver Gibson, Lionel Tarassenko; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 12479-12489
Advances in camera-based physiological monitoring have enabled the robust non-contact measurement of respiration and the cardiac pulse which are known to be indicative of the sleep stage. This has led to research into camera-based sleep monitoring as a promising alternative to "gold-standard" polysomnography which is cumbersome expensive to administer and hence unsuitable for longer-term clinical studies. In this paper we introduce SleepVST a transformer model which enables state-of-the-art performance in camera-based sleep stage classification (sleep staging). After pre-training on contact sensor data SleepVST outperforms existing methods for cardio-respiratory sleep staging on the SHHS and MESA datasets achieving total Cohen's kappa scores of 0.75 and 0.77 respectively. We then show that SleepVST can be successfully transferred to cardio-respiratory waveforms extracted from video enabling fully contact-free sleep staging. Using a video dataset of 50 nights we achieve a total accuracy of 78.8% and a Cohen's \kappa of 0.71 in four-class video-based sleep staging setting a new state-of-the-art in the domain.

Coarse-to-Fine Latent Diffusion for Pose-Guided Person Image Synthesis
Yanzuo Lu, Manlin Zhang, Andy J Ma, Xiaohua Xie, Jianhuang Lai; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 6420-6429
Diffusion model is a promising approach to image generation and has been employed for Pose-Guided Person Image Synthesis (PGPIS) with competitive performance. While existing methods simply align the person appearance to the target pose they are prone to overfitting due to the lack of a high-level semantic understanding on the source person image. In this paper we propose a novel Coarse-to-Fine Latent Diffusion (CFLD) method for PGPIS. In the absence of image-caption pairs and textual prompts we develop a novel training paradigm purely based on images to control the generation process of a pre-trained text-to-image diffusion model. A perception-refined decoder is designed to progressively refine a set of learnable queries and extract semantic understanding of person images as a coarse-grained prompt. This allows for the decoupling of fine-grained appearance and pose in

formation controls at different stages and thus circumventing the potential over fitting problem. To generate more realistic texture details a hybrid-granularity attention module is proposed to encode multi-scale fine-grained appearance features as bias terms to augment the coarse-grained prompt. Both quantitative and qualitative experimental results on the DeepFashion benchmark demonstrate the superiority of our method over the state of the arts for PGPIS. Code is available at https://github.com/YanzuoLu/CFLD.

Watermark-embedded Adversarial Examples for Copyright Protection against Diffusion Models
Peifei Zhu, Tsubasa Takahashi, Hirokatsu Kataoka; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 24420-24430
Diffusion Models (DMs) have shown remarkable capabilities in various image-generation tasks. However there are growing concerns that DMs could be used to imitate unauthorized creations and thus raise copyright issues. To address this issue we propose a novel framework that embeds personal watermarks in the generation of adversarial examples. Such examples can force DMs to generate images with visible watermarks and prevent DMs from imitating unauthorized images. We construct a generator based on conditional adversarial networks and design three losses (adversarial loss GAN loss and perturbation loss) to generate adversarial examples that have subtle perturbation but can effectively attack DMs to prevent copyright violations. Training a generator for a personal watermark by our method only requires 5-10 samples within 2-3 minutes and once the generator is trained it can generate adversarial examples with that watermark significantly fast (0.2s per image). We conduct extensive experiments in various conditional image-generation scenarios. Compared to existing methods that generate images with chaotic textures our method adds visible watermarks on the generated images which is a more straightforward way to indicate copyright violations. We also observe that our adversarial examples exhibit good transferability across unknown generative models. Therefore this work provides a simple yet powerful way to protect copyright from DM-based imitation.

TCP:Textual-based Class-aware Prompt tuning for Visual-Language Model
Hantao Yao, Rui Zhang, Changsheng Xu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 23438-23448
Prompt tuning represents a valuable technique for adapting pre-trained visual-language models (VLM) to various downstream tasks. Recent advancements in CoOp-based methods propose a set of learnable domain-shared or image-conditional textual tokens to facilitate the generation of task-specific textual classifiers. However those textual tokens have a limited generalization ability regarding unseen domains as they cannot dynamically adjust to the distribution of testing classes. To tackle this issue we present a novel Textual-based Class-aware Prompt tuning (TCP) that explicitly incorporates prior knowledge about classes to enhance their discriminability. The critical concept of TCP involves leveraging Textual Knowledge Embedding (TKE) to map the high generalizability of class-level textual knowledge into class aware textual tokens. By seamlessly integrating these class-aware prompts into the Text Encoder a dynamic class-aware classifier is generated to enhance discriminability for unseen domains. During inference TKE dynamically generates class-aware prompts related to the unseen classes. Comprehensive evaluations demonstrate that TKE serves as a plug-and-play module effortlessly combinable with existing methods. Furthermore TCP consistently achieves superior performance while demanding less training time.

OMG: Towards Open-vocabulary Motion Generation via Mixture of Controllers
Han Liang, Jiacheng Bao, Ruichi Zhang, Sihan Ren, Yuecheng Xu, Sibei Yang, Xin Chen, Jingyi Yu, Lan Xu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 482-493
We have recently seen tremendous progress in realistic text-to-motion generation. Yet the existing methods often fail or produce implausible motions with unseen

text inputs which limits the applications. In this paper we present OMG a novel
 framework which enables compelling motion generation from zero-shot open-vocabu
lary text prompts. Our key idea is to carefully tailor the pretrain-then-finetun
e paradigm into the text-to-motion generation. At the pre-training stage our mod
el improves the generation ability by learning the rich out-of-domain inherent m
otion traits. To this end we scale up a large unconditional diffusion model up t
o 1B parameters so as to utilize the massive unlabeled motion data up to over 20
M motion instances. At the subsequent fine-tuning stage we introduce motion Cont
rolNet which incorporates text prompts as conditioning information through a tra
inable copy of the pre-trained model and the proposed novel Mixture-of-Controlle
rs (MoC) block. MoC block adaptively recognizes various ranges of the sub-motion
s with a cross-attention mechanism and processes them separately with the text-t
oken-specific experts. Such a design effectively aligns the CLIP token embedding
s of text prompts to various ranges of compact and expressive motion features. E
xtensive experiments demonstrate that our OMG achieves significant improvements
over the state-of-the-art methods on zero-shot text-to-motion generation. Projec
t page: https://tr3e.github.io/omg-page.

TimeChat: A Time-sensitive Multimodal Large Language Model for Long Video Unders
tanding
Shuhuai Ren, Linli Yao, Shicheng Li, Xu Sun, Lu Hou; Proceedings of the IEEE/CVF
 Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 14313-1
4323
This work proposes TimeChat a time-sensitive multimodal large language model spe
cifically designed for long video understanding. Our model incorporates two key
architectural contributions: (1) a timestamp-aware frame encoder that binds visu
al content with the timestamp of each frame and (2) a sliding video Q-Former tha
t produces a video token sequence of varying lengths to accommodate videos of va
rious durations. Additionally we construct an instruction-tuning dataset encompa
ssing 6 tasks and a total of 125K instances to further enhance TimeChat's instru
ction-following performance. Experiment results across various video understandi
ng tasks such as dense captioning temporal grounding and highlight detection dem
onstrate TimeChat's strong zero-shot temporal localization and reasoning capabil
ities. For example it achieves +9.2 F1 score and +2.8 CIDEr on YouCook2 +5.8 HIT
@1 on QVHighlights and +27.5 R@1 (IoU=0.5) on Charades-STA compared to state-of-
the-art video large language models holding the potential to serve as a versatil
e video assistant for long-form video comprehension tasks and satisfy realistic
user requirements.

Align Your Gaussians: Text-to-4D with Dynamic 3D Gaussians and Composed Diffusio
n Models
Huan Ling, Seung Wook Kim, Antonio Torralba, Sanja Fidler, Karsten Kreis; Procee
dings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVP
R), 2024, pp. 8576-8588
Text-guided diffusion models have revolutionized image and video generation and
have also been successfully used for optimization-based 3D object synthesis. Her
e we instead focus on the underexplored text-to-4D setting and synthesize dynami
c animated 3D objects using score distillation methods with an additional tempor
al dimension. Compared to previous work we pursue a novel compositional generati
on-based approach and combine text-to-image text-to-video and 3D-aware multiview
 diffusion models to provide feedback during 4D object optimization thereby simu
ltaneously enforcing temporal consistency high-quality visual appearance and rea
listic geometry. Our method called Align Your Gaussians (AYG) leverages dynamic
3D Gaussian Splatting with deformation fields as 4D representation. Crucial to A
YG is a novel method to regularize the distribution of the moving 3D Gaussians a
nd thereby stabilize the optimization and induce motion. We also propose a motio
n amplification mechanism as well as a new autoregressive synthesis scheme to ge
nerate and combine multiple 4D sequences for longer generation. These techniques
 allow us to synthesize vivid dynamic scenes outperform previous work qualitativ
ely and quantitatively and achieve state-of-the-art text-to-4D performance. Due

to the Gaussian 4D representation different 4D animations can be seamlessly comb ined as we demonstrate. AYG opens up promising avenues for animation simulation and digital content creation as well as synthetic data generation.

Test-Time Domain Generalization for Face Anti-Spoofing
Qianyu Zhou, Ke-Yue Zhang, Taiping Yao, Xuequan Lu, Shouhong Ding, Lizhuang Ma; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognitio n (CVPR), 2024, pp. 175-187
Face Anti-Spoofing (FAS) is pivotal in safeguarding facial recognition systems a gainst presentation attacks. While domain generalization (DG) methods have been developed to enhance FAS performance they predominantly focus on learning domain -invariant features during training which may not guarantee generalizability to unseen data that differs largely from the source distributions. Our insight is t hat testing data can serve as a valuable resource to enhance the generalizabilit y beyond mere evaluation for DG FAS. In this paper we introduce a novel Test-Tim e Domain Generalization (TTDG) framework for FAS which leverages the testing dat a to boost the model's generalizability. Our method consisting of Test-Time Styl e Projection (TTSP) and Diverse Style Shifts Simulation (DSSS) effectively proje cts the unseen data to the seen domain space. In particular we first introduce t he innovative TTSP to project the styles of the arbitrarily unseen samples of th e testing distribution to the known source space of the training distributions. We then design the efficient DSSS to synthesize diverse style shifts via learnab le style bases with two specifically designed losses in a hyperspherical feature space. Our method eliminates the need for model updates at the test time and ca n be seamlessly integrated into not only the CNN but also ViT backbones. Compreh ensive experiments on widely used cross-domain FAS benchmarks demonstrate our me thod's state-of-the-art performance and effectiveness.

DiffusionMTL: Learning Multi-Task Denoising Diffusion Model from Partially Annot ated Data
Hanrong Ye, Dan Xu; Proceedings of the IEEE/CVF Conference on Computer Vision an d Pattern Recognition (CVPR), 2024, pp. 27960-27969
Recently there has been an increased interest in the practical problem of learni ng multiple dense scene understanding tasks from partially annotated data where each training sample is only labeled for a subset of the tasks. The missing of t ask labels in training leads to low-quality and noisy predictions as can be obse rved from state-of-the-art methods. To tackle this issue we reformulate the part ially-labeled multi-task dense prediction as a pixel-level denoising problem and propose a novel multi-task denoising diffusion framework coined as DiffusionMTL . It designs a joint diffusion and denoising paradigm to model a potential noisy

distribution in the task prediction or feature maps and generate rectified outputs for different tasks. To exploit multi-task consistency in denoising we further introduce a Multi-Task Conditioning strategy which can implicitly utilize the complementary nature of the tasks to help learn the unlabeled tasks leading to an improvement in the denoising performance of the different tasks. Extensive quantitative and qualitative experiments demonstrate that the proposed multi-task denoising diffusion model can significantly improve multi-task prediction maps and outperform the state-of-the-art methods on three challenging multi-task benchmarks under two different partial-labeling evaluation settings. The code is available at https://prismformore.github.io/diffusionmtl/.
****
Spike-guided Motion Deblurring with Unknown Modal Spatiotemporal Alignment
Jiyuan Zhang, Shiyan Chen, Yajing Zheng, Zhaofei Yu, Tiejun Huang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 25047-25057
The traditional frame-based cameras that rely on exposure windows for imaging experience motion blur in high-speed scenarios. Frame-based deblurring methods lack reliable motion cues to restore sharp images under extreme blur conditions. The spike camera is a novel neuromorphic visual sensor that outputs spike streams with ultra-high temporal resolution. It can supplement the temporal information lost in traditional cameras and guide motion deblurring. However in real-world scenarios aligning discrete RGB images and continuous spike streams along both temporal and spatial axes is challenging due to the complexity of calibrating their coordinates device displacements in vibrations and time deviations. Misalignment of pixels leads to severe degradation of deblurring. We introduce the first framework for spike-guided motion deblurring without knowing the spatiotemporal alignment between spikes and images. To address the problem we first propose a novel three-stage network containing a basic deblurring net a carefully designed bi-directional deformable aligning module and a flow-based multi-scale fusion net. Experimental results demonstrate that our approach can effectively guide the image deblurring with unknown alignment surpassing the performance of other methods. Public project page: https://github.com/Leozhangjiyuan/UaSDN.

VRP-SAM: SAM with Visual Reference Prompt
Yanpeng Sun, Jiahui Chen, Shan Zhang, Xinyu Zhang, Qiang Chen, Gang Zhang, Errui Ding, Jingdong Wang, Zechao Li; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 23565-23574
In this paper we propose a novel Visual Reference Prompt (VRP) encoder that empowers the Segment Anything Model (SAM) to utilize annotated reference images as prompts for segmentation creating the VRP-SAM model. In essence VRP-SAM can utilize annotated reference images to comprehend specific objects and perform segmentation of specific objects in target image. It is note that the VRP encoder can support a variety of annotation formats for reference images including point box scribble and mask. VRP-SAM achieves a breakthrough within the SAM framework by extending its versatility and applicability while preserving SAM's inherent strengths thus enhancing user-friendliness. To enhance the generalization ability of VRP-SAM the VRP encoder adopts a meta-learning strategy. To validate the effectiveness of VRP-SAM we conducted extensive empirical studies on the Pascal and COCO datasets. Remarkably VRP-SAM achieved state-of-the-art performance in visual reference segmentation with minimal learnable parameters. Furthermore VRP-SAM demonstrates strong generalization capabilities allowing it to perform segmentation of unseen objects and enabling cross-domain segmentation. The source code and models will be available at https://github.com/syp2ysy/VRP-SAM

Discriminability-Driven Channel Selection for Out-of-Distribution Detection
Yue Yuan, Rundong He, Yicong Dong, Zhongyi Han, Yilong Yin; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 26171-26180
Out-of-distribution (OOD) detection is essential for deploying machine learning models in open-world environments. Activation-based methods are a key approach i

n OOD detection working to mitigate overconfident predictions of OOD data. These techniques rectifying anomalous activations enhancing the distinguishability between in-distribution (ID) data and OOD data. However they assume by default that every channel is necessary for OOD detection and rectify anomalous activations in each channel. Empirical evidence has shown that there is a significant difference among various channels in OOD detection and discarding some channels can greatly enhance the performance of OOD detection. Based on this insight we propose \underline D iscriminability-\underline D riven \underline C hannel \underline S election (DDCS) which leverages an adaptive channel selection by estimating the discriminative score of each channel to boost OOD detection. The discriminative score takes inter-class similarity and inter-class variance of training data into account. However the estimation of discriminative score itself is susceptible to anomalous activations. To better estimate score we pre-rectify anomalous activations for each channel mildly. The experimental results show that DDCS achieves state-of-the-art performance on CIFAR and ImageNet-1K benchmarks. Moreover DDCS can generalize to different backbones and OOD scores.

ManiFPT: Defining and Analyzing Fingerprints of Generative Models
Hae Jin Song, Mahyar Khayatkhoei, Wael AbdAlmageed; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 10791-10801
Recent works have shown that generative models leave traces of their underlying generative process on the generated samples broadly referred to as fingerprints of a generative model and have studied their utility in detecting synthetic images from real ones. However the extend to which these fingerprints can distinguish between various types of synthetic image and help identify the underlying generative process remain under-explored. In particular the very definition of a fingerprint remains unclear to our knowledge. To that end in this work we formalize the definition of artifact and fingerprint in generative models propose an algorithm for computing them in practice and finally study its effectiveness in distinguishing a large array of different generative models. We find that using our proposed definition can significantly improve the performance on the task of identifying the underlying generative process from samples (model attribution) compared to existing methods. Additionally we study the structure of the fingerprints and observe that it is very predictive of the effect of different design choices on the generative process.

3DGS-Avatar: Animatable Avatars via Deformable 3D Gaussian Splatting
Zhiyin Qian, Shaofei Wang, Marko Mihajlovic, Andreas Geiger, Siyu Tang; Proceedi

ngs of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 5020-5030
We introduce an approach that creates animatable human avatars from monocular videos using 3D Gaussian Splatting (3DGS). Existing methods based on neural radiance fields (NeRFs) achieve high-quality novel-view/novel-pose image synthesis but often require days of training and are extremely slow at inference time. Recently the community has explored fast grid structures for efficient training of clothed avatars. Albeit being extremely fast at training these methods can barely achieve an interactive rendering frame rate with around 15 FPS. In this paper we use 3D Gaussian Splatting and learn a non-rigid deformation network to reconstruct animatable clothed human avatars that can be trained within 30 minutes and rendered at real-time frame rates (50+ FPS). Given the explicit nature of our representation we further introduce as-isometric-as-possible regularizations on both the Gaussian mean vectors and the covariance matrices enhancing the generalization of our model on highly articulated unseen poses. Experimental results show that our method achieves comparable and even better performance compared to state-of-the-art approaches on animatable avatar creation from a monocular input while being 400x and 250x faster in training and inference respectively.

Quilt-LLaVA: Visual Instruction Tuning by Extracting Localized Narratives from Open-Source Histopathology Videos
Mehmet Saygin Seyfioglu, Wisdom O. Ikezogwo, Fatemeh Ghezloo, Ranjay Krishna, Linda Shapiro; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 13183-13192
Diagnosis in histopathology requires a global whole slide images (WSIs) analysis requiring pathologists to compound evidence from different WSI patches. The gigapixel scale of WSIs poses a challenge for histopathology multi-modal models. Training multi-model models for histopathology requires instruction tuning datasets which currently contain information for individual image patches without a spatial grounding of the concepts within each patch and without a wider view of the WSI. To bridge this gap we introduce QUILT-INSTRUCT a large-scale dataset of 107131 histopathology-specific instruction question/answer pairs grounded within diagnostically relevant image patches that make up the WSI. Our dataset is collected by leveraging educational histopathology videos from YouTube which provides spatial localization of narrations by automatically extracting the narrators' cursor positions. QUILT-INSTRUCT supports contextual reasoning by extracting diagnosis and supporting facts from the entire WSI. Using QUILT-INSTRUCT we train QUILT-LLAVA which can reason beyond the given single image patch enabling diagnostic reasoning across patches. To evaluate QUILT-LLAVA we propose a comprehensive evaluation dataset created from 985 images and 1283 human-generated question-answers. We also thoroughly evaluate QUILT-LLAVA using public histopathology datasets where QUILT-LLAVA significantly outperforms SOTA by over 10% on relative GPT-4 score and 4% and 9% on open and closed set VQA.

Traffic Scene Parsing through the TSP6K Dataset
Peng-Tao Jiang, Yuqi Yang, Yang Cao, Qibin Hou, Ming-Ming Cheng, Chunhua Shen; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 21874-21885
Traffic scene perception in computer vision is a critically important task to achieve intelligent cities. To date most existing datasets focus on autonomous driving scenes. We observe that the models trained on those driving datasets often yield unsatisfactory results on traffic monitoring scenes. However little effort has been put into improving the traffic monitoring scene understanding mainly due to the lack of specific datasets. To fill this gap we introduce a specialized traffic monitoring dataset termed TSP6K containing images from the traffic monitoring scenario with high-quality pixel-level and instance-level annotations. The TSP6K dataset captures more crowded traffic scenes with several times more traffic participants than the existing driving scenes. We perform a detailed analysis of the dataset and comprehensively evaluate previous popular scene parsing methods instance segmentation methods and unsupervised domain adaption methods. Fu

rthermore considering the vast difference in instance sizes we propose a detail refining decoder for scene parsing which recovers the details of different semantic regions in traffic scenes owing to the proposed TSP6K dataset. Experiments show its effectiveness in parsing the traffic monitoring scenes. Code and dataset are available at https://github.com/PengtaoJiang/TSP6K.

Style Aligned Image Generation via Shared Attention
Amir Hertz, Andrey Voynov, Shlomi Fruchter, Daniel Cohen-Or; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 4775-4785
Large-scale Text-to-Image (T2I) models have rapidly gained prominence across creative fields generating visually compelling outputs from textual prompts. However controlling these models to ensure consistent style remains challenging with existing methods necessitating fine-tuning and manual intervention to disentangle content and style. In this paper we introduce StyleAligned a novel technique designed to establish style alignment among a series of generated images. By employing minimal `attention sharing' during the diffusion process our method maintains style consistency across images within T2I models. This approach allows for the creation of style-consistent images using a reference style through a straightforward inversion operation. Our method's evaluation across diverse styles and text prompts demonstrates high-quality synthesis and fidelity underscoring its efficacy in achieving consistent style across various inputs.

E-GPS: Explainable Geometry Problem Solving via Top-Down Solver and Bottom-Up Generator
Wenjun Wu, Lingling Zhang, Jun Liu, Xi Tang, Yaxian Wang, Shaowei Wang, Qianying Wang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 13828-13837
Geometry Problem Solving has drawn growing attention recently due to its application prospects in intelligent education field. However existing methods are still inadequate to meet the needs of practical application suffering from the following limitations: 1) explainability is not ensured which is essential in real teaching scenarios; 2) the small scale and incomplete annotation of existing datasets make it hard for model to comprehend geometric knowledge. To tackle the above problems we propose a novel method called Explainable Geometry Problem Solving (E-GPS). E-GPS first parses the geometric diagram and problem text into unified formal language representations. Then the answer and explainable reasoning and solving steps are obtained by a Top-Down Problem Solver (TD-PS) which innovatively solves the problem from the target and focuses on what is needed. To alleviate the data issues a Bottom-Up Problem Generator (BU-PG) is devised to augment the data set with various well-annotated constructed geometry problems. It enables us to train an enhanced theorem predictor with a better grasp of theorem knowledge which further improves the efficiency of TD-PS. Extensive experiments demonstrate that E-GPS maintains comparable solving performances with fewer steps and provides outstanding explainability.

Back to 3D: Few-Shot 3D Keypoint Detection with Back-Projected 2D Features
Thomas Wimmer, Peter Wonka, Maks Ovsjanikov; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 4154-4164
With the immense growth of dataset sizes and computing resources in recent years so-called foundation models have become popular in NLP and vision tasks. In this work we propose to explore foundation models for the task of keypoint detection on 3D shapes. A unique characteristic of keypoint detection is that it requires semantic and geometric awareness while demanding high localization accuracy. To address this problem we propose first to back-project features from large pre-trained 2D vision models onto 3D shapes and employ them for this task. We show that we obtain robust 3D features that contain rich semantic information and analyze multiple candidate features stemming from different 2D foundation models. Second we employ a keypoint candidate optimization module which aims to match the average observed distribution of keypoints on the shape and is guided by the bac

k-projected features. The resulting approach achieves a new state of the art for few-shot keypoint detection on the KeyPointNet dataset almost doubling the performance of the previous best methods.

Fourier Priors-Guided Diffusion for Zero-Shot Joint Low-Light Enhancement and Deblurring
Xiaoqian Lv, Shengping Zhang, Chenyang Wang, Yichen Zheng, Bineng Zhong, Chongyi Li, Liqiang Nie; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 25378-25388
Existing joint low-light enhancement and deblurring methods learn pixel-wise mappings from paired synthetic data which results in limited generalization in real-world scenes. While some studies explore the rich generative prior of pre-trained diffusion models they typically rely on the assumed degradation process and cannot handle unknown real-world degradations well. To address these problems we propose a novel zero-shot framework FourierDiff which embeds Fourier priors into a pre-trained diffusion model to harmoniously handle the joint degradation of luminance and structures. FourierDiff is appealing in its relaxed requirements on paired training data and degradation assumptions. The key zero-shot insight is motivated by image characteristics in the Fourier domain: most luminance information concentrates on amplitudes while structure and content information are closely related to phases. Based on this observation we decompose the sampled results of the reverse diffusion process in the Fourier domain and take advantage of the amplitude of the generative prior to align the enhanced brightness with the distribution of natural images. To yield a sharp and content-consistent enhanced result we further design a spatial-frequency alternating optimization strategy to progressively refine the phase of the input. Extensive experiments demonstrate the superior effectiveness of the proposed method especially in real-world scenes.
****
Neural Markov Random Field for Stereo Matching
Tongfan Guan, Chen Wang, Yun-Hui Liu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 5459-5469
Stereo matching is a core task for many computer vision and robotics applications. Despite their dominance in traditional stereo methods the hand-crafted Markov Random Field (MRF) models lack sufficient modeling accuracy compared to end-to-end deep models. While deep learning representations have greatly improved the unary terms of the MRF models the overall accuracy is still severely limited by the hand-crafted pairwise terms and message passing. To address these issues we propose a neural MRF model where both potential functions and message passing are designed using data-driven neural networks. Our fully data-driven model is built on the foundation of variational inference theory to prevent convergence issues and retain stereo MRF's graph inductive bias. To make the inference tractable and scale well to high-resolution images we also propose a Disparity Proposal Network (DPN) to adaptively prune the search space of disparity. The proposed approach ranks 1^ st on both KITTI 2012 and 2015 leaderboards among all published methods while running faster than 100 ms. This approach significantly outperforms prior global methods e.g. lowering D1 metric by more than 50% on KITTI 2015. In addition our method exhibits strong cross-domain generalization and can recover sharp edges. The codes at https://github.com/aeolusguan/NMRF.

Driving into the Future: Multiview Visual Forecasting and Planning with World Model for Autonomous Driving
Yuqi Wang, Jiawei He, Lue Fan, Hongxin Li, Yuntao Chen, Zhaoxiang Zhang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 14749-14759
In autonomous driving predicting future events in advance and evaluating the foreseeable risks empowers autonomous vehicles to plan their actions enhancing safety and efficiency on the road. To this end we propose Drive-WM the first driving world model compatible with existing end-to-end planning models. Through a joint spatial-temporal modeling facilitated by view factorization our model is the f

irst to generate high-fidelity multiview videos. Building on its powerful genera tion ability we showcase the potential of applying the world model for safe driv ing planning for the first time. Our Drive-WM enables driving into multiple futu res based on distinct driving maneuvers and determines the optimal trajectory ac cording to the image-based rewards. Evaluation on real-world driving datasets ve rifies that our method could generate high-quality consistent and controllable m ultiview videos opening up possibilities for real-world simulations and safe pla nning.

OpenESS: Event-based Semantic Scene Understanding with Open Vocabularies
Lingdong Kong, Youquan Liu, Lai Xing Ng, Benoit R. Cottereau, Wei Tsang Ooi; Pro ceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 15686-15698
Event-based semantic segmentation (ESS) is a fundamental yet challenging task fo r event camera sensing. The difficulties in interpreting and annotating event da ta limit its scalability. While domain adaptation from images to event data can help to mitigate this issue there exist data representational differences that r equire additional effort to resolve. In this work for the first time we synergiz e information from image text and event-data domains and introduce OpenESS to en able scalable ESS in an open-world annotation-efficient manner. We achieve this goal by transferring the semantically rich CLIP knowledge from image-text pairs to event streams. To pursue better cross-modality adaptation we propose a frame- to-event contrastive distillation and a text-to-event semantic consistency regul arization. Experimental results on popular ESS benchmarks showed our approach ou tperforms existing methods. Notably we achieve 53.93% and 43.31% mIoU on DDD17 a nd DSEC-Semantic without using either event or frame labels.

Do Vision and Language Encoders Represent the World Similarly?
Mayug Maniparambil, Raiymbek Akshulakov, Yasser Abdelaziz Dahou Djilali, Mohamed El Amine Seddik, Sanath Narayan, Karttikeya Mangalam, Noel E. O'Connor; Proceed ings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 14334-14343
Aligned text-image encoders such as CLIP have become the de-facto model for visi on-language tasks. Furthermore modality-specific encoders achieve impressive per formances in their respective domains. This raises a central question: does an a lignment exist between uni-modal vision and language encoders since they fundame ntally represent the same physical world? Analyzing the latent spaces structure of vision and language models on image-caption benchmarks using the Centered Ker nel Alignment (CKA) we find that the representation spaces of unaligned and alig ned encoders are semantically similar. In the absence of statistical similarity in aligned encoders like CLIP we show that a possible matching of unaligned enco ders exists without any training. We frame this as a seeded graph-matching probl em exploiting the semantic similarity between graphs and propose two methods - a Fast Quadratic Assignment Problem optimization and a novel localized CKA metric -based matching/retrieval. We demonstrate the effectiveness of this on several d ownstream tasks including cross-lingual cross-domain caption matching and image classification. Code available at github.com/mayug/0-shot-llm-vision.

MGMap: Mask-Guided Learning for Online Vectorized HD Map Construction
Xiaolu Liu, Song Wang, Wentong Li, Ruizi Yang, Junbo Chen, Jianke Zhu; Proceedin gs of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 14812-14821
Currently high-definition (HD) map construction leans towards a lightweight onli ne generation tendency which aims to preserve timely and reliable road scene inf ormation. However map elements contain strong shape priors. Subtle and sparse an notations make current detection-based frameworks ambiguous in locating relevant feature scopes and cause the loss of detailed structures in prediction. To alle viate these problems we propose MGMap a mask-guided approach that effectively hi ghlights the informative regions and achieves precise map element localization b y introducing the learned masks. Specifically MGMap employs learned masks based

on the enhanced multi-scale BEV features from two perspectives. At the instance level we propose the Mask-activated instance (MAI) decoder which incorporates global instance and structural information into instance queries by the activation of instance masks. At the point level a novel position-guided mask patch refinement (PG-MPR) module is designed to refine point locations from a finer-grained perspective enabling the extraction of point-specific patch information. Compared to the baselines our proposed MGMap achieves a notable improvement of around 10 mAP for different input modalities. Extensive experiments also demonstrate that our approach showcases strong robustness and generalization capabilities. Our code can be found at https://github.com/xiaolul2/MGMap.

Scaling Up to Excellence: Practicing Model Scaling for Photo-Realistic Image Restoration In the Wild
Fanghua Yu, Jinjin Gu, Zheyuan Li, Jinfan Hu, Xiangtao Kong, Xintao Wang, Jingwen He, Yu Qiao, Chao Dong; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 25669-25680
We introduce SUPIR (Scaling-UP Image Restoration) a groundbreaking image restoration method that harnesses generative prior and the power of model scaling up. Leveraging multi-modal techniques and advanced generative prior SUPIR marks a significant advance in intelligent and realistic image restoration. As a pivotal catalyst within SUPIR model scaling dramatically enhances its capabilities and demonstrates new potential for image restoration. We collect a dataset comprising 20 million high-resolution high-quality images for model training each enriched with descriptive text annotations. SUPIR provides the capability to restore images guided by textual prompts broadening its application scope and potential. Moreover we introduce negative-quality prompts to further improve perceptual quality. We also develop a restoration-guided sampling method to suppress the fidelity issue encountered in generative-based restoration. Experiments demonstrate SUPIR's exceptional restoration effects and its novel capacity to manipulate restoration through textual prompts.

Q-Instruct: Improving Low-level Visual Abilities for Multi-modality Foundation Models
Haoning Wu, Zicheng Zhang, Erli Zhang, Chaofeng Chen, Liang Liao, Annan Wang, Kaixin Xu, Chunyi Li, Jingwen Hou, Guangtao Zhai, Geng Xue, Wenxiu Sun, Qiong Yan, Weisi Lin; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 25490-25500
Multi-modality large language models (MLLMs) as represented by GPT-4V have introduced a paradigm shift for visual perception and understanding tasks that a variety of abilities can be achieved within one foundation model. While current MLLMs demonstrate primary low-level visual abilities from the identification of low-level visual attributes (e.g. clarity brightness) to the evaluation on image quality there's still an imperative to further improve the accuracy of MLLMs to substantially alleviate human burdens. To address this we collect the first dataset consisting of human natural language feedback on low-level vision. Each feedback offers a comprehensive description of an image's low-level visual attributes culminating in an overall quality assessment. The constructed Q-Pathway dataset includes 58K detailed human feedbacks on 18973 multi-sourced images with diverse low-level appearance. To ensure MLLMs can adeptly handle diverse queries we further propose a GPT-participated transformation to convert these feedbacks into a rich set of 200K instruction-response pairs termed Q-Instruct. Experimental results indicate that the Q-Instruct consistently elevates various low-level visual capabilities across multiple base models. We anticipate that our datasets can pave the way for a future that foundation models can assist humans on low-level visual tasks.
****
PoseIRM: Enhance 3D Human Pose Estimation on Unseen Camera Settings via Invariant Risk Minimization
Yanlu Cai, Weizhong Zhang, Yuan Wu, Cheng Jin; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 2124-2133

Camera-parameter-free multi-view pose estimation is an emerging technique for 3D
 human pose estimation (HPE). They can infer the camera settings implicitly or e
xplicitly to mitigate the depth uncertainty impact showcasing significant potent
ial in real applications. However due to the limited camera setting diversity in
 the available datasets the inferred camera parameters are always simply hardcod
ed into the model during training and not adaptable to the input in inference ma
king the learned models cannot generalize well under unseen camera settings. A n
atural solution is to artificially synthesize some samples i.e. 2D-3D pose pairs
 under massive new camera settings. Unfortunately to prevent over-fitting the ex
isting camera setting the number of synthesized samples for each new camera sett
ing should be comparable with that for the existing one which multiplies the sca
le of training and even makes it computationally prohibitive. In this paper we p
ropose a novel HPE approach under the invariant risk minimization (IRM) paradigm
. Precisely we first synthesize 2D poses from myriad camera settings. We then tr
ain our model under the IRM paradigm which targets at learning a common optimal
model across all camera settings and thus enforces the model to automatically le
arn the camera parameters based on the input data. This allows the model to accu
rately infer 3D poses on unseen data by training on only a handful of samples fr
om each synthesized setting and thus avoid the unbearable training cost incremen
t. Another appealing feature of our method is that benefited from the capability
 of IRM in identifying the invariant features its performance on the seen camera
 settings is enhanced as well. Comprehensive experiments verify the superiority
of our approach.

Zero-Shot Structure-Preserving Diffusion Model for High Dynamic Range Tone Mappi
ng
Ruoxi Zhu, Shusong Xu, Peiye Liu, Sicheng Li, Yanheng Lu, Dimin Niu, Zihao Liu,
Zihao Meng, Zhiyong Li, Xinhua Chen, Yibo Fan; Proceedings of the IEEE/CVF Confe
rence on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 26130-26139
Tone mapping techniques aiming to convert high dynamic range (HDR) images to hig
h-quality low dynamic range (LDR) images for display play a more crucial role in
 real-world vision systems with the increasing application of HDR images. Howeve
r obtaining paired HDR and high-quality LDR images is difficult posing a challen
ge to deep learning based tone mapping methods. To overcome this challenge we pr
opose a novel zero-shot tone mapping framework that utilizes shared structure kn
owledge allowing us to transfer a pre-trained mapping model from the LDR domain
to HDR fields without paired training data. Our approach involves decomposing bo
th the LDR and HDR images into two components: structural information and tonal
information. To preserve the original image's structure we modify the reverse sa
mpling process of a diffusion model and explicitly incorporate the structure inf
ormation into the intermediate results. Additionally for improved image details
we introduce a dual-control network architecture that enables different types of
 conditional inputs to control different scales of the output. Experimental resu
lts demonstrate the effectiveness of our approach surpassing previous state-of-t
he-art methods both qualitatively and quantitatively. Moreover our model exhibit
s versatility and can be applied to other low-level vision tasks without retrain
ing. The code is available at https://github.com/ZSDM-HDR/Zero-Shot-Diffusion-HD
R.

VidLA: Video-Language Alignment at Scale
Mamshad Nayeem Rizve, Fan Fei, Jayakrishnan Unnikrishnan, Son Tran, Benjamin Z.
Yao, Belinda Zeng, Mubarak Shah, Trishul Chilimbi; Proceedings of the IEEE/CVF C
onference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 14043-140
55
In this paper we propose VidLA an approach for video-language alignment at scale
. There are two major limitations of previous video-language alignment approache
s. First they do not capture both short-range and long-range temporal dependenci
es and typically employ complex hierarchical deep network architectures that are
 hard to integrate with existing pretrained image-text foundation models. To eff
ectively address this limitation we instead keep the network architecture simple

and use a set of data tokens that operate at different temporal resolutions in a hierarchical manner accounting for the temporally hierarchical nature of videos. By employing a simple two-tower architecture we are able to initialize our video-language model with pretrained image-text foundation models thereby boosting the final performance. Second existing video-language alignment works struggle due to the lack of semantically aligned large-scale training data. To overcome it we leverage recent LLMs to curate the largest video-language dataset to date with better visual grounding. Furthermore unlike existing video-text datasets which only contain short clips our dataset is enriched with video clips of varying durations to aid our temporally hierarchical data tokens in extracting better representations at varying temporal scales. Overall empirical results show that our proposed approach surpasses state-of-the-art methods on multiple retrieval benchmarks especially on longer videos and performs competitively on classification benchmarks.
****
VoCo: A Simple-yet-Effective Volume Contrastive Learning Framework for 3D Medical Image Analysis
Linshan Wu, Jiaxin Zhuang, Hao Chen; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 22873-22882
Self-Supervised Learning (SSL) has demonstrated promising results in 3D medical image analysis. However the lack of high-level semantics in pre-training still heavily hinders the performance of downstream tasks. We observe that 3D medical images contain relatively consistent contextual position information i.e. consistent geometric relations between different organs which leads to a potential way for us to learn consistent semantic representations in pre-training. In this paper we propose a simple-yet-effective Volume Contrast (VoCo) framework to leverage the contextual position priors for pre-training. Specifically we first generate a group of base crops from different regions while enforcing feature discrepancy among them where we employ them as class assignments of different regions. Then we randomly crop sub-volumes and predict them belonging to which class (located at which region) by contrasting their similarity to different base crops which can be seen as predicting contextual positions of different sub-volumes. Through this pretext task VoCo implicitly encodes the contextual position priors into model representations without the guidance of annotations enabling us to effectively improve the performance of downstream tasks that require high-level semantics. Extensive experimental results on six downstream tasks demonstrate the superior effectiveness of VoCo. Code will be available at https://github.com/Luffy03/VoCo.

CCEdit: Creative and Controllable Video Editing via Diffusion Models
Ruoyu Feng, Wenming Weng, Yanhui Wang, Yuhui Yuan, Jianmin Bao, Chong Luo, Zhibo Chen, Baining Guo; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 6712-6722
In this paper we present CCEdit a versatile generative video editing framework based on diffusion models. Our approach employs a novel trident network structure that separates structure and appearance control ensuring precise and creative editing capabilities. Utilizing the foundational ControlNet architecture we maintain the structural integrity of the video during editing. The incorporation of an additional appearance branch enables users to exert fine-grained control over the edited key frame. These two side branches seamlessly integrate into the main branch which is constructed upon existing text-to-image (T2I) generation models through learnable temporal layers. The versatility of our framework is demonstrated through a diverse range of choices in both structure representations and personalized T2I models as well as the option to provide the edited key frame. To facilitate comprehensive evaluation we introduce the BalanceCC benchmark dataset comprising 100 videos and 4 target prompts for each video. Our extensive user studies compare CCEdit with eight state-of-the-art video editing methods. The outcomes demonstrate CCEdit's substantial superiority over all other methods.

IPoD: Implicit Field Learning with Point Diffusion for Generalizable 3D Object R

econstruction from Single RGB-D Images
Yushuang Wu, Luyue Shi, Junhao Cai, Weihao Yuan, Lingteng Qiu, Zilong Dong, Lief eng Bo, Shuguang Cui, Xiaoguang Han; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 20432-20442
Generalizable 3D object reconstruction from single-view RGB-D images remains a challenging task particularly with real-world data. Current state-of-the-art methods develop Transformer-based implicit field learning necessitating an intensive learning paradigm that requires dense query-supervision uniformly sampled throughout the entire space. We propose a novel approach IPoD which harmonizes implicit field learning with point diffusion. This approach treats the query points for implicit field learning as a noisy point cloud for iterative denoising allowing for their dynamic adaptation to the target object shape. Such adaptive query points harness diffusion learning's capability for coarse shape recovery and also enhances the implicit representation's ability to delineate finer details. Besides an additional self-conditioning mechanism is designed to use implicit predictions as the guidance of diffusion learning leading to a cooperative system. Experiments conducted on the CO3D-v2 dataset affirm the superiority of IPoD achieving 7.8% improvement in F-score and 28.6% in Chamfer distance over existing methods. The generalizability of IPoD is also demonstrated on the MVImgNet dataset. Our project page is at https://yushuang-wu.github.io/IPoD.

HAVE-FUN: Human Avatar Reconstruction from Few-Shot Unconstrained Images
Xihe Yang, Xingyu Chen, Daiheng Gao, Shaohui Wang, Xiaoguang Han, Baoyuan Wang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 742-752
As for human avatar reconstruction contemporary techniques commonly necessitate the acquisition of costly data and struggle to achieve satisfactory results from a small number of casual images. In this paper we investigate this task from a few-shot unconstrained photo album. The reconstruction of human avatars from such data sources is challenging because of limited data amount and dynamic articulated poses. For handling dynamic data we integrate a skinning mechanism with deep marching tetrahedra (DMTet) to form a drivable tetrahedral representation which drives arbitrary mesh topologies generated by the DMTet for the adaptation of unconstrained images. To effectively mine instructive information from few-shot data we devise a two-phase optimization method with few-shot reference and few-shot guidance. The former focuses on aligning avatar identity with reference images while the latter aims to generate plausible appearances for unseen regions. Overall our framework called HaveFun can undertake avatar reconstruction rendering and animation. Extensive experiments on our developed benchmarks demonstrate that HaveFun exhibits substantially superior performance in reconstructing the human body and hand.

ERMVP: Communication-Efficient and Collaboration-Robust Multi-Vehicle Perception in Challenging Environments
Jingyu Zhang, Kun Yang, Yilei Wang, Hanqi Wang, Peng Sun, Liang Song; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 12575-12584
Collaborative perception enhances perception performance by enabling autonomous vehicles to exchange complementary information. Despite its potential to revolutionize the mobile industry challenges in various environments such as communication bandwidth limitations localization errors and information aggregation inefficiencies hinder its implementation in practical applications. In this work we propose ERMVP a communication-Efficient and collaboration-Robust Multi-Vehicle Perception method in challenging environments. Specifically ERMVP has three distinct strengths: i) It utilizes the hierarchical feature sampling strategy to abstract a representative set of feature vectors using less communication overhead for efficient communication; ii) It employs the sparse consensus features to execute precise spatial location calibrations effectively mitigating the implications of vehicle localization errors; iii) A pioneering feature fusion and interaction paradigm is introduced to integrate holistic spatial semantics among different

vehicles and data sources. To thoroughly validate our method we conduct extensiv e experiments on real-world and simulated datasets. The results demonstrate that the proposed ERMVP is significantly superior to the state-of-the-art collaborat ive perception methods.

DiffMorpher: Unleashing the Capability of Diffusion Models for Image Morphing
Kaiwen Zhang, Yifan Zhou, Xudong Xu, Bo Dai, Xingang Pan; Proceedings of the IEE E/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 79 12-7921
Diffusion models have achieved remarkable image generation quality surpassing pr evious generative models. However a notable limitation of diffusion models in co mparison to GANs is their difficulty in smoothly interpolating between two image samples due to their highly unstructured latent space. Such a smooth interpolat ion is intriguing as it naturally serves as a solution for the image morphing ta sk with many applications. In this work we address this limitation via DiffMorph er an approach that enables smooth and natural image interpolation by harnessing the prior knowledge of a pre-trained diffusion model. Our key idea is to captur e the semantics of the two images by fitting two LoRAs to them respectively and interpolate between both the LoRA parameters and the latent noises to ensure a s mooth semantic transition where correspondence automatically emerges without the need for annotation. In addition we propose an attention interpolation and inje ction technique an adaptive normalization adjustment method and a new sampling s chedule to further enhance the smoothness between consecutive images. Extensive experiments demonstrate that DiffMorpher achieves starkly better image morphing effects than previous methods across a variety of object categories bridging a c ritical functional gap that distinguished diffusion models from GANs.

Towards Real-World HDR Video Reconstruction: A Large-Scale Benchmark Dataset and A Two-Stage Alignment Network
Yong Shu, Liquan Shen, Xiangyu Hu, Mengyao Li, Zihao Zhou; Proceedings of the IE EE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 2 879-2888
As an important and practical way to obtain high dynamic range (HDR) video HDR v ideo reconstruction from sequences with alternating exposures is still less expl ored mainly due to the lack of large-scale real-world datasets. Existing methods are mostly trained on synthetic datasets which perform poorly in real scenes. I n this work to facilitate the development of real-world HDR video reconstruction we present Real-HDRV a large-scale real-world benchmark dataset for HDR video r econstruction featuring various scenes diverse motion patterns and high-quality labels. Specifically our dataset contains 500 LDRs-HDRs video pairs comprising a bout 28000 LDR frames and 4000 HDR labels covering daytime nighttime indoor and outdoor scenes. To our best knowledge our dataset is the largest real-world HDR video reconstruction dataset. Correspondingly we propose an end-to-end network f or HDR video reconstruction where a novel two-stage strategy is designed to perf orm alignment sequentially. Specifically the first stage performs global alignme nt with the adaptively estimated global offsets reducing the difficulty of subse quent alignment. The second stage implicitly performs local alignment in a coars e-to-fine manner at the feature level using the adaptive separable convolution. Extensive experiments demonstrate that: (1) models trained on our dataset can ac hieve better performance on real scenes than those trained on synthetic datasets ; (2) our method outperforms previous state-of-the-art methods. Our dataset is a vailable at https://github.com/yungsyu99/Real-HDRV.

Efficient 3D Implicit Head Avatar with Mesh-anchored Hash Table Blendshapes
Ziqian Bai, Feitong Tan, Sean Fanello, Rohit Pandey, Mingsong Dou, Shichen Liu, Ping Tan, Yinda Zhang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 1975-1984
3D head avatars built with neural implicit volumetric representations have achie ved unprecedented levels of photorealism. However the computational cost of thes e methods remains a significant barrier to their widespread adoption particularl

y in real-time applications such as virtual reality and teleconferencing. While attempts have been made to develop fast neural rendering approaches for static scenes these methods cannot be simply employed to support realistic facial expressions such as in the case of a dynamic facial performance. To address these challenges we propose a novel fast 3D neural implicit head avatar model that achieves real-time rendering while maintaining fine-grained controllability and high rendering quality. Our key idea lies in the introduction of local hash table blendshapes which are learned and attached to the vertices of an underlying face parametric model. These per-vertex hash-tables are linearly merged with weights predicted via a CNN resulting in expression dependent embeddings. Our novel representation enables efficient density and color predictions using a lightweight MLP which is further accelerated by a hierarchical nearest neighbor search method. Extensive experiments show that our approach runs in real-time while achieving comparable rendering quality to state-of-the-arts and decent results on challenging expressions.

PikeLPN: Mitigating Overlooked Inefficiencies of Low-Precision Neural Networks
Marina Neseem, Conor McCullough, Randy Hsin, Chas Leichner, Shan Li, In Suk Chong, Andrew Howard, Lukasz Lew, Sherief Reda, Ville-Mikko Rautio, Daniele Moro; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 15996-16005
Low-precision quantization is recognized for its efficacy in neural network optimization. Our analysis reveals that non-quantized elementwise operations which are prevalent in layers such as parameterized activation functions batch normalization and quantization scaling dominate the inference cost of low-precision models. These non-quantized elementwise operations are commonly overlooked in SOTA efficiency metrics such as Arithmetic Computation Effort (ACE). In this paper we propose ACEv2 - an extended version of ACE which offers a better alignment with the inference cost of quantized models and their energy consumption on ML hardware. Moreover we introduce PikeLPN a model that addresses these efficiency issues by applying quantization to both elementwise operations and multiply-accumulate operations. In particular we present a novel quantization technique for batch normalization layers named QuantNorm which allows for quantizing the batch normalization parameters without compromising the model performance. Additionally we propose applying Double Quantization where the quantization scaling parameters are quantized. Furthermore we recognize and resolve the issue of distribution mismatch in Separable Convolution layers by introducing Distribution-Heterogeneous Quantization which enables quantizing them to low-precision. PikeLPN achieves Pareto-optimality in efficiency-accuracy trade-off with up to 3X efficiency improvement compared to SOTA low-precision models.

CurveCloudNet: Processing Point Clouds with 1D Structure
Colton Stearns, Alex Fu, Jiateng Liu, Jeong Joon Park, Davis Rempe, Despoina Paschalidou, Leonidas J. Guibas; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 27981-27991
Modern depth sensors such as LiDAR operate by sweeping laser-beams across the scene resulting in a point cloud with notable 1D curve-like structures. In this work we introduce a new point cloud processing scheme and backbone called CurveCloudNet which takes advantage of the curve-like structure inherent to these sensors. While existing backbones discard the rich 1D traversal patterns and rely on generic 3D operations CurveCloudNet parameterizes the point cloud as a collection of polylines (dubbed a "curve cloud") establishing a local surface-aware ordering on the points. By reasoning along curves CurveCloudNet captures lightweight curve-aware priors to efficiently and accurately reason in several diverse 3D environments. We evaluate CurveCloudNet on multiple synthetic and real datasets that exhibit distinct 3D size and structure. We demonstrate that CurveCloudNet outperforms both point-based and sparse-voxel backbones in various segmentation settings notably scaling to large scenes better than point-based alternatives while exhibiting improved single-object performance over sparse-voxel alternatives. In all CurveCloudNet is an efficient and accurate backbone that can handle a large

r variety of 3D environments than past works.

CAGE: Controllable Articulation GEneration
Jiayi Liu, Hou In Ivan Tam, Ali Mahdavi-Amiri, Manolis Savva; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 17880-17889
We address the challenge of generating 3D articulated objects in a controllable fashion. Currently modeling articulated 3D objects is either achieved through laborious manual authoring or using methods from prior work that are hard to scale and control directly. We leverage the interplay between part shape connectivity and motion using a denoising diffusion-based method with attention modules designed to extract correlations between part attributes. Our method takes an object category label and a part connectivity graph as input and generates an object's geometry and motion parameters. The generated objects conform to user-specified constraints on the object category part shape and part articulation. Our experiments show that our method outperforms the state-of-the-art in articulated object generation producing more realistic objects while conforming better to user constraints.

No Time to Train: Empowering Non-Parametric Networks for Few-shot 3D Scene Segmentation
Xiangyang Zhu, Renrui Zhang, Bowei He, Ziyu Guo, Jiaming Liu, Han Xiao, Chaoyou Fu, Hao Dong, Peng Gao; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 3838-3847
To reduce the reliance on large-scale datasets recent works in 3D segmentation resort to few-shot learning. Current 3D few-shot segmentation methods first pre-train models on 'seen' classes and then evaluate their generalization performance on 'unseen' classes. However the prior pre-training stage not only introduces excessive time overhead but also incurs a significant domain gap on 'unseen' classes. To tackle these issues we propose a Non-parametric Network for few-shot 3D Segmentation Seg-NN and its Parametric variant Seg-PN. Without training Seg-NN extracts dense representations by hand-crafted filters and achieves comparable performance to existing parameterized models. Due to the elimination of pre-training Seg-NN can alleviate the domain gap issue and save a substantial amount of time. Based on Seg-NN Seg-PN only requires training a lightweight QUEry-Support Transferring (QUEST) module which enhances the interaction between the support set and query set. Experiments suggest that Seg-PN outperforms previous state-of-the-art method by +4.19% and +7.71% mIoU on S3DIS and ScanNet datasets respectively while reducing training time by -90% indicating its effectiveness and efficiency. Code is available https://github.com/yangyangyang127/Seg-NN.

PhysGaussian: Physics-Integrated 3D Gaussians for Generative Dynamics
Tianyi Xie, Zeshun Zong, Yuxing Qiu, Xuan Li, Yutao Feng, Yin Yang, Chenfanfu Jiang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 4389-4398
We introduce PhysGaussian a new method that seamlessly integrates physically grounded Newtonian dynamics within 3D Gaussians to achieve high-quality novel motion synthesis. Employing a customized Material Point Method (MPM) our approach enriches 3D Gaussian kernels with physically meaningful kinematic deformation and mechanical stress attributes all evolved in line with continuum mechanics principles. A defining characteristic of our method is the seamless integration between physical simulation and visual rendering: both components utilize the same 3D Gaussian kernels as their discrete representations. This negates the necessity for triangle/tetrahedron meshing marching cubes cage meshes or any other geometry embedding highlighting the principle of "what you see is what you simulate (WS^2)". Our method demonstrates exceptional versatility across a wide variety of materials--including elastic entities plastic metals non-Newtonian fluids and granular materials--showcasing its strong capabilities in creating diverse visual content with novel viewpoints and movements.

Spatio-Temporal Turbulence Mitigation: A Translational Perspective
Xingguang Zhang, Nicholas Chimitt, Yiheng Chi, Zhiyuan Mao, Stanley H. Chan; Pro
ceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (
CVPR), 2024, pp. 2889-2899
Recovering images distorted by atmospheric turbulence is a challenging inverse p
roblem due to the stochastic nature of turbulence. Although numerous turbulence
mitigation (TM) algorithms have been proposed their efficiency and generalizatio
n to real-world dynamic scenarios remain severely limited. Building upon the int
uitions of classical TM algorithms we present the Deep Atmospheric TUrbulence Mi
tigation network (DATUM). DATUM aims to overcome major challenges when transitio
ning from classical to deep learning approaches. By carefully integrating the me
rits of classical multi-frame TM methods into a deep network structure we demons
trate that DATUM can efficiently perform long-range temporal aggregation using a
 recurrent fashion while deformable attention and temporal-channel attention sea
mlessly facilitate pixel registration and lucky imaging. With additional supervi
sion tilt and blur degradation can be jointly mitigated. These inductive biases
empower DATUM to significantly outperform existing methods while delivering a te
nfold increase in processing speed. A large-scale training dataset ATSyn is pres
ented as a co-invention to enable the generalization to real turbulence. Our cod
e and datasets are available at https://xg416.github.io/DATUM/

FocusMAE: Gallbladder Cancer Detection from Ultrasound Videos with Focused Maske
d Autoencoders
Soumen Basu, Mayuna Gupta, Chetan Madan, Pankaj Gupta, Chetan Arora; Proceedings
 of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2
024, pp. 11715-11725
In recent years automated Gallbladder Cancer (GBC) detection has gained the atte
ntion of researchers. Current state-of-the-art (SOTA) methodologies relying on u
ltrasound sonography (US) images exhibit limited generalization emphasizing the
need for transformative approaches. We observe that individual US frames may lac
k sufficient information to capture disease manifestation. This study advocates
for a paradigm shift towards video-based GBC detection leveraging the inherent a
dvantages of spatiotemporal representations. Employing the Masked Autoencoder (M
AE) for representation learning we address shortcomings in conventional image-ba
sed methods. We propose a novel design called FocusMAE to systematically bias th
e selection of masking tokens from high-information regions fostering a more ref
ined representation of malignancy. Additionally we contribute the most extensive
 US video dataset for GBC detection. We also note that this is the first study o
n US video-based GBC detection. We validate the proposed methods on the curated
dataset and report a new SOTA accuracy of 96.4% for the GBC detection problem ag
ainst an accuracy of 84% by current Image-based SOTA - GBCNet and RadFormer and
94.7% by Video-based SOTA - AdaMAE. We further demonstrate the generality of the
 proposed FocusMAE on a public CT-based Covid detection dataset reporting an imp
rovement in accuracy by 3.3% over current baselines. Project page with source co
de trained models and data is available at: https://gbc-iitd.github.io/focusmae.

Grounded Text-to-Image Synthesis with Attention Refocusing
Quynh Phung, Songwei Ge, Jia-Bin Huang; Proceedings of the IEEE/CVF Conference o
n Computer Vision and Pattern Recognition (CVPR), 2024, pp. 7932-7942
Driven by the scalable diffusion models trained on large-scale datasets text-to-
image synthesis methods have shown compelling results. However these models stil
l fail to precisely follow the text prompt involving multiple objects attributes
 or spatial compositions. In this paper we reveal the potential causes of the di
ffusion model's cross-attention and self-attention layers. We propose two novel
losses to refocus attention maps according to a given spatial layout during samp
ling. Creating the layouts manually requires additional effort and can be tediou
s. Therefore we explore using large language models (LLM) to produce these layou
ts for our method. We conduct extensive experiments on the DrawBench HRS and TIF
A benchmarks to evaluate our proposed method. We show that our proposed attentio
n refocusing effectively improves the controllability of existing approaches.

OpenStreetView-5M: The Many Roads to Global Visual Geolocation
Guillaume Astruc, Nicolas Dufour, Ioannis Siglidis, Constantin Aronssohn, Nacim Bouia, Stephanie Fu, Romain Loiseau, Van Nguyen Nguyen, Charles Raude, Elliot Vincent, Lintao Xu, Hongyu Zhou, Loic Landrieu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 21967-21977
Determining the location of an image anywhere on Earth is a complex visual task which makes it particularly relevant for evaluating computer vision algorithms. Determining the location of an image anywhere on Earth is a complex visual task which makes it particularly relevant for evaluating computer vision algorithms. Yet the absence of standard large-scale open-access datasets with reliably localizable images has limited its potential. To address this issue we introduce OpenStreetView-5M a large-scale open-access dataset comprising over 5.1 million geo-referenced street view images covering 225 countries and territories. In contrast to existing benchmarks we enforce a strict train/test separation allowing us to evaluate the relevance of learned geographical features beyond mere memorization. To demonstrate the utility of our dataset we conduct an extensive benchmark of various state-of-the-art image encoders spatial representations and training strategies. All associated codes and models can be found at https://github.com/gastruc/osv5m.
****
Visual Concept Connectome (VCC): Open World Concept Discovery and their Interlayer Connections in Deep Models
Matthew Kowal, Richard P. Wildes, Konstantinos G. Derpanis; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 10895-10905
Understanding what deep network models capture in their learned representations is a fundamental challenge in computer vision. We present a new methodology to understanding such vision models the Visual Concept Connectome (VCC) which discovers human interpretable concepts and their interlayer connections in a fully unsupervised manner. Our approach simultaneously reveals fine-grained concepts at a layer connection weightings across all layers and is amendable to global analysis of network structure (e.g. branching pattern of hierarchical concept assemblies). Previous work yielded ways to extract interpretable concepts from single layers and examine their impact on classification but did not afford multilayer concept analysis across an entire network architecture. Quantitative and qualitative empirical results show the effectiveness of VCCs in the domain of image classification. Also we leverage VCCs for the application of failure mode debugging to reveal where mistakes arise in deep networks.

IReNe: Instant Recoloring of Neural Radiance Fields
Alessio Mazzucchelli, Adrian Garcia-Garcia, Elena Garces, Fernando Rivas-Manzaneque, Francesc Moreno-Noguer, Adrian Penate-Sanchez; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 5937-5946
Advances in NERFs have allowed for 3D scene reconstructions and novel view synthesis. Yet efficiently editing these representations while retaining photorealism is an emerging challenge. Recent methods face three primary limitations: they're slow for interactive use lack precision at object boundaries and struggle to ensure multi-view consistency. We introduce IReNe to address these limitations enabling swift near real-time color editing in NeRF. Leveraging a pre-trained NeRF model and a single training image with user-applied color edits IReNe swiftly adjusts network parameters in seconds. This adjustment allows the model to generate new scene views accurately representing the color changes from the training image while also controlling object boundaries and view-specific effects. Object boundary control is achieved by integrating a trainable segmentation module into the model. The process gains efficiency by retraining only the weights of the last network layer. We observed that neurons in this layer can be classified into those responsible for view-dependent appearance and those contributing to diffuse appearance. We introduce an automated classification approach to identify the

se neuron types and exclusively fine-tune the weights of the diffuse neurons. Th
is further accelerates training and ensures consistent color edits across differ
ent views. A thorough validation on a new dataset with edited object colors show
s significant quantitative and qualitative advancements over competitors acceler
ating speeds by 5x and 500x.

Class Tokens Infusion for Weakly Supervised Semantic Segmentation
Sung-Hoon Yoon, Hoyong Kwon, Hyeonseong Kim, Kuk-Jin Yoon; Proceedings of the IE
EE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 3
595-3605
Weakly Supervised Semantic Segmentation (WSSS) relies on Class Activation Maps (
CAMs) to extract spatial information from image-level labels. With the success o
f Vision Transformer (ViT) the migration of ViT is actively conducted in WSSS. T
his work proposes a novel WSSS framework with Class Token Infusion (CTI). By inf
using the class tokens from images we guide class tokens to possess class-specif
ic distinct characteristics and global-local consistency. For this we devise two
 kinds of token infusion: 1) Intra-image Class Token Infusion (I-CTI) and 2) Cro
ss-Image Class Token Infusion (C-CTI). In I-CTI we infuse the class tokens from
the same but differently augmented images and thus make CAMs consistent among va
rious deformations (view color). In C-CTI by infusing the class tokens from the
other images and imposing the resulting CAMs to be similar it learns class-speci
fic distinct characteristics. Besides the CTI we bring the background (BG) conce
pt into ViT with the BG token to reduce the false positive activation of CAMs. W
e demonstrate the effectiveness of our method on PASCAL VOC 2012 and MS COCO 201
4 datasets achieving state-of-the-art results in weakly supervised semantic segm
entation. The code is available at https://github.com/yoon307/CTI

FedHCA2: Towards Hetero-Client Federated Multi-Task Learning
Yuxiang Lu, Suizhi Huang, Yuwen Yang, Shalayiding Sirejiding, Yue Ding, Hongtao
Lu; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recogn
ition (CVPR), 2024, pp. 5599-5609
Federated Learning (FL) enables joint training across distributed clients using
their local data privately. Federated Multi-Task Learning (FMTL) builds on FL to
 handle multiple tasks assuming model congruity that identical model architectur
e is deployed in each client. To relax this assumption and thus extend real-worl
d applicability we introduce a novel problem setting Hetero-Client Federated Mul
ti-Task Learning (HC-FMTL) to accommodate diverse task setups. The main challeng
e of HC-FMTL is the model incongruity issue that invalidates conventional aggreg
ation methods. It also escalates the difficulties in model aggregation to deal w
ith data and task heterogeneity inherent in FMTL. To address these challenges we
 propose the FedHCA^2 framework which allows for federated training of personali
zed models by modeling relationships among heterogeneous clients. Drawing on our
 theoretical insights into the difference between multi-task and federated optim
ization we propose the Hyper Conflict-Averse Aggregation scheme to mitigate conf
licts during encoder updates. Additionally inspired by task interaction in MTL t
he Hyper Cross Attention Aggregation scheme uses layer-wise cross attention to e
nhance decoder interactions while alleviating model incongruity. Moreover we emp
loy learnable Hyper Aggregation Weights for each client to customize personalize
d parameter updates. Extensive experiments demonstrate the superior performance
of FedHCA^2 in various HC-FMTL scenarios compared to representative methods. Cod
e is available at https://github.com/innovator-zero/FedHCA2.

Text-IF: Leveraging Semantic Text Guidance for Degradation-Aware and Interactive
 Image Fusion
Xunpeng Yi, Han Xu, Hao Zhang, Linfeng Tang, Jiayi Ma; Proceedings of the IEEE/C
VF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 27026
-27035
Image fusion aims to combine information from different source images to create
a comprehensively representative image. Existing fusion methods are typically he
lpless in dealing with degradations in low-quality source images and non-interac

tive to multiple subjective and objective needs. To solve them we introduce a no vel approach that leverages semantic text guidance image fusion model for degrad ation-aware and interactive image fusion task termed as Text-IF. It innovatively extends the classical image fusion to the text guided image fusion along with t he ability to harmoniously address the degradation and interaction issues during fusion. Through the text semantic encoder and semantic interaction fusion decod er Text-IF is accessible to the all-in-one infrared and visible image degradatio n-aware processing and the interactive flexible fusion outcomes. In this way Tex t-IF achieves not only multi-modal image fusion but also multi-modal information fusion. Extensive experiments prove that our proposed text guided image fusion strategy has obvious advantages over SOTA methods in the image fusion performanc e and degradation treatment. The code is available at https://github.com/Xunpeng Yi/Text-IF.

GRAM: Global Reasoning for Multi-Page VQA
Tsachi Blau, Sharon Fogel, Roi Ronen, Alona Golts, Roy Ganz, Elad Ben Avraham, A viad Aberdam, Shahar Tsiper, Ron Litman; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 15598-15607
The increasing use of transformer-based large language models brings forward the challenge of processing long sequences. In document visual question answering (DocVQA) leading methods focus on the single-page setting while documents can spa n hundreds of pages. We present GRAM a method that seamlessly extends pre-traine d single-page models to the multi-page setting without requiring computationally -heavy pretraining. To do so we leverage a single-page encoder for local page-le vel understanding and enhance it with document-level designated layers and learn able tokens facilitating the flow of information across pages for global reasoni ng. To enforce our model to utilize the newly introduced document tokens we prop ose a tailored bias adaptation method. For additional computational savings duri ng decoding we introduce an optional compression stage using our compression-tra nsformer (CFormer)reducing the encoded sequence length thereby allowing a tradeo ff between quality and latency. Extensive experiments showcase GRAM's state-of-t he-art performance on the benchmarks for multi-page DocVQA demonstrating the eff ectiveness of our approach.

MS-DETR: Efficient DETR Training with Mixed Supervision
Chuyang Zhao, Yifan Sun, Wenhao Wang, Qiang Chen, Errui Ding, Yi Yang, Jingdong Wang; Proceedings of the IEEE/CVF Conference on Computer Vision and Pattern Reco gnition (CVPR), 2024, pp. 17027-17036
DETR accomplishes end-to-end object detection through iteratively generating mul tiple object candidates based on image features and promoting one candidate for each ground-truth object. The traditional training procedure using one-to-one su pervision in the original DETR lacks direct supervision for the object detection candidates. We aim at improving the DETR training efficiency by explicitly supe rvising the candidate generation procedure through mixing one-to-one supervision and one-to-many supervision. Our approach namely MS-DETR is simple and places o ne-to-many supervision to the object queries of the primary decoder that is used for inference. In comparison to existing DETR variants with one-to-many supervi sion such as Group DETR and Hybrid DETR our approach does not need additional de coder branches or object queries. The object queries of the primary decoder in o ur approach directly benefit from one-to-many supervision and thus are superior in object candidate prediction. Experimental results show that our approach outp erforms related DETR variants such as DN-DETR Hybrid DETR and Group DETR and the combination with related DETR variants further improves the performance.

Learning to Produce Semi-dense Correspondences for Visual Localization
Khang Truong Giang, Soohwan Song, Sungho Jo; Proceedings of the IEEE/CVF Confere nce on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 19468-19478
This study addresses the challenge of performing visual localization in demandin g conditions such as night-time scenarios adverse weather and seasonal changes. While many prior studies have focused on improving image matching performance to

 facilitate reliable dense keypoint matching between images existing methods oft
en heavily rely on predefined feature points on a reconstructed 3D model. Conseq
uently they tend to overlook unobserved keypoints during the matching process. T
herefore dense keypoint matches are not fully exploited leading to a notable red
uction in accuracy particularly in noisy scenes. To tackle this issue we propose
 a novel localization method that extracts reliable semi-dense 2D-3D matching po
ints based on dense keypoint matches. This approach involves regressing semi-den
se 2D keypoints into 3D scene coordinates using a point inference network. The n
etwork utilizes both geometric and visual cues to effectively infer 3D coordinat
es for unobserved keypoints from the observed ones. The abundance of matching in
formation significantly enhances the accuracy of camera pose estimation even in
scenarios involving noisy or sparse 3D models. Comprehensive evaluations demonst
rate that the proposed method outperforms other methods in challenging scenes an
d achieves competitive results in large-scale visual localization benchmarks. Th
e code will be available at https://github.com/TruongKhang/DeViLoc

Amodal Ground Truth and Completion in the Wild
Guanqi Zhan, Chuanxia Zheng, Weidi Xie, Andrew Zisserman; Proceedings of the IEE
E/CVF Conference on Computer Vision and Pattern Recognition (CVPR), 2024, pp. 28
003-28013
This paper studies amodal image segmentation: predicting entire object segmentat
ion masks including both visible and invisible (occluded) parts. In previous wor
k the amodal segmentation ground truth on real images is usually predicted by ma
nual annotaton and thus is subjective. In contrast we use 3D data to establish a
n automatic pipeline to determine authentic ground truth amodal masks for partia
lly occluded objects in real images. This pipeline is used to construct an amoda
l completion evaluation benchmark MP3D-Amodal consisting of a variety of object
categories and labels. To better handle the amodal completion task in the wild w
e explore two architecture variants: a two-stage model that first infers the occ
luder followed by amodal mask completion; and a one-stage model that exploits th
e representation power of Stable Diffusion for amodal segmentation across many c
ategories. Without bells and whistles our method achieves a new state-of-the-art
 performance on Amodal segmentation datasets that cover a large variety of objec
ts including COCOA and our new MP3D-Amodal dataset. The dataset model and code a
re available at https://www. robots.ox.ac.uk/ vgg/research/amodal/.

Motion Diversification Networks
Hee Jae Kim, Eshed Ohn-Bar; Proceedings of the IEEE/CVF Conference on Computer V
ision and Pattern Recognition (CVPR), 2024, pp. 1650-1660
We introduce Motion Diversification Networks a novel framework for learning to g
enerate realistic and diverse 3D human motion. Despite recent advances in deep g
enerative motion modeling existing models often fail to produce samples that cap
ture the full range of plausible and natural 3D human motion within a given cont
ext. The lack of diversity becomes even more apparent in applications where subt
le and multi-modal 3D human forecasting is crucial for safety such as robotics a
nd autonomous driving. Towards more realistic and functional 3D motion models we
 highlight limitations in existing generative modeling techniques particularly i
n overly simplistic latent code sampling strategies. We then introduce a transfo
rmer-based diversification mechanism that learns to effectively guide sampling i
n the latent space. Our proposed attention-based module queries multiple stochas
tic samples to flexibly predict a diverse set of latent codes which can be subse
quently decoded into motion samples. The proposed framework achieves state-of-th
e-art diversity and accuracy prediction performance across a range of benchmarks
 and settings particularly when used to forecast intricate in-the-wild 3D human
motion within complex urban environments. Our models datasets and code are avail
able at https://mdncvpr.github.io/.
